EXTRACT

From an Act prescribing Rules for the Government of the State Library, passed March 8th, 1861.

Section 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

Sec. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

CALIFORNI LIBR

JAN. 1, 1870—Price Reduced to $4, and name of paper abbreviated to "Scientific Press."

Mining and Scientific Press Patent Circular.

To Inventors
ON THE
Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Established in 1860.

Our business has been long and successfully practiced, and we are thoroughly responsible for the confidence and valuable trusts placed in our charge. Our advice can always be relied upon as correct.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with and have full records of all former cases, and can more correctly judge of the value and patentability of inventions discovered here, than any other agents.

Steps Necessary to Procure a Patent.

The FIRST thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A model of less size will answer when more convenient. It should be neatly made, of hard wood or metal, or both, and varnished or painted; the name of the inventor and the name of the article should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention, and the relation of the new to the old parts of the machine.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operation.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by registered letter, post office order, or by draft on San Francisco, payable to our order. Always send a letter with the model, and with the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and acknowledgement before a Notary Public or Justice of the Peace, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of $20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and at the expiration of two years the invention therein described shall become public property as against the applicant therefor.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, (unless they are of a common and well known character), and also of the manufactured article itself must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case the applicant has only to send us an exact description, and what it is desirable to claim.

For Designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances two photographs, with the negatives, answer well instead of drawings.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless the invention is one of great complication, usually the business can be well done by correspondence.

The usual time required to secure a patent, when the case is conducted at our agency, is from one to two months. We sometimes get them through in two weeks. In rare cases, however, owing to delay on the part of Government officials, the period is sometimes extended for months. We make a special point to advance our cases as rapidly as possible, and have been successful in obtaining patents for this coast more surely and speedily than any other agency in the United States.

Letters Patent and Who Can Obtain them.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or Foreigners, male or females, (including minors), and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

Citizens of Canada and Nova Scotia have to pay a fee of $500 for patents in the U. S., owing to discriminations made against Americans.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service.

A majority of the Patents issued during the past eight years to Pacific Coast inventors have been secured through our Agency; consequently we can more readily and correctly advise new applicants than any other agent.

Important Advantages.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights *much sooner* than by trusting the same to distant agencies, situated at New York or Washington.

Many inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use. A personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

By an able and faithful representative of our firm in Washington, our clients' applications are guarded against indifferent examination, unfair treatment in any contingency, and hazardous delays.

Patents for inventors on this coast are actually secured cheaper through our agency than any other, however flattering may be the inducements offered at the commencement by others.

Extensive practice gives us great facilities, securing regularity in the transaction of our business, which extends to EVERY COUNTRY IN THE WORLD where patent laws exist.

We assist in bringing valuable inventions to the general notice of the public throughout the Pacific Coast by illustration or description in the columns of the MINING AND SCIENTIFIC PRESS.

Confidential Advice.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice we make no charge. A pen-and-ink sketch and description of the invention should be sent together with a stamp for return postage. Write plain, do not use pencil or pale ink; be brief.

Remember all business committed to our care, and all consultations, are kept by us secret and strictly confidential. Our permanent business interests demand, as it were, a sacred compliance with our obligations as solicitors, and in reference to our strict fidelity in this respect we refer to one and all of the thousands of inventors and patentees on this coast who have patronized us.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is $25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

Following is the list of Government fees, payable in currency:

On every caveat	$10
On every application for a patent, for seventeen years	15
On every application for a design, for 3 y'rs and 6 mos	10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

By Telegraph.

In cases of immediate importance we can have their progress reported by telegraph, so that applicants know immediately the result of the examination and decision of the Patent Office. We also make examinations by telegraph regarding the patentability of inventions; examine patent assignments on record at Washington; obtain copies of patents or claims, and also derive other information desired instantly from the Patent Office.

Reasons for Success.

We would especially call the attention of the inventive public to the fact that our Patent Agency is taking out a larger number of Patents than any other agency west of the Mississippi River. We do our work promptly and thoroughly, and refer to our standing amongst inventors as an evidence of our success in our special department. Our work is all done inside of our office, BY COMPETENT AND RELIABLE PERSONS, who have been for years interested and associated with us. We therefore are not compelled (like many agencies) to trust valuable and important inventions promiscuously to outsiders, to have part of the case prepared, but inventors can depend that, from the time their cases are first placed in our office, they are kept with proper secrecy until full rights are secured in the Patent Office in Washington. This is an important point in the proper prosecution of Patent business. It is a notorious fact that some prominent agencies trust a considerable portion of their cases to apprentices and amateurs. A deficiency or want of attention to the small affairs of any kind of business will often prove as harmful as a flagrant violation of the most important rules which govern and control it.

Mechanical Movements from Dewey & Co's Pamphlet Circular.

PLATE I.

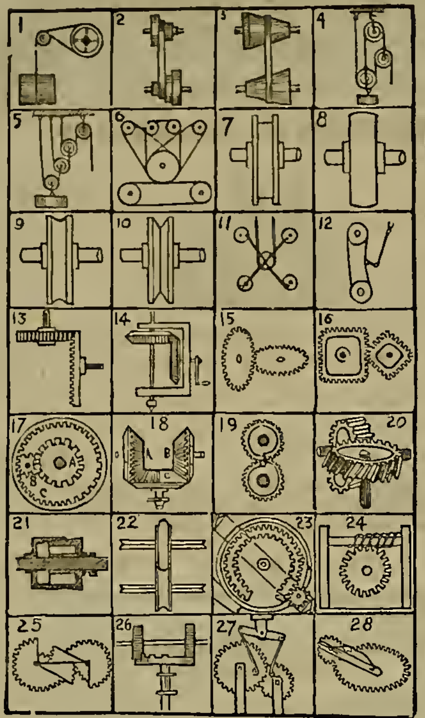

PLATE V.

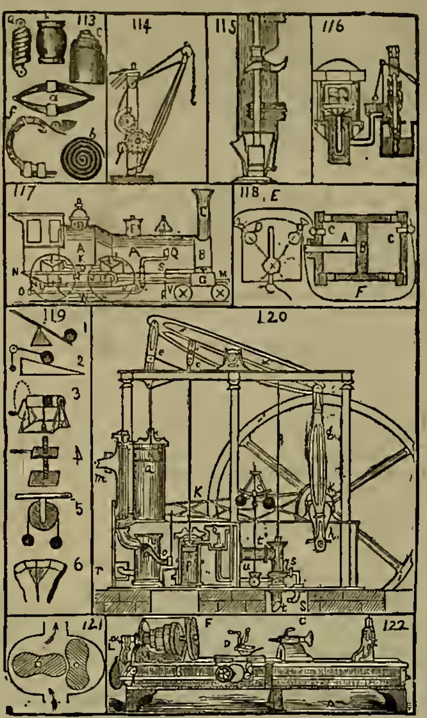

The explanations of the above and many other illustrations is contained in our Free Circular, which will be sent free on receipt of postage stamp.

To Eastern Inventors.

Our close proximity to British Columbia, Mexico, Central and South American States, Australia and the Islands, enables us to obtain Letters Patent for you with much less *delay* and expense than they can be secured through any other agency in the United States.

Melbourne, in Australia, is a city of larger proportions that San Francisco, besides the adjacent colonies are of great commercial and mineral importance. Inventions of all kinds, but especially those relating to the saving of gold and silver, if secured in Australia, will often prove of great value. We have competent agents there, and can promise that the business will be attended to with fidelity and dispatch.

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

In early days but little preparation was needed, or but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent Office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of *responsibility* and *experience*. As agents with such qualifications, we solicit honest patronage.

Interferences.

INTERFERING APPLICATIONS are conducted with spirit and ability on the most favorable terms, by DEWEY & CO. It sometimes happens that an applicant finds his invention has been patented by another, but more recent discoverer. In such cases the prior discoverer can obtain full right to the invention if he can produce tangible evidence of priority.

When patentees are threatened with interference they should consult able and responsible agents before they either allow themselves to be hacked down from their rights, or trespass upon the rights of others. We will always counsel and advise in such cases upon the most reasonable terms—often saving clients heavy damages and exorbitant fees.

Advancing Cases.

If any case placed in our hands meets with rejection, we do not wait to write and inform the inventor of this fact, (as is the case with most agents,) but our representative at Washington proceeds at once to examine the stated objections, and if it be not a just and unavoidable decision, the claims of the inventor will be presistently argued before the Examiner, and if possible the decision reversed.

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

Inventors having models in our possession must send written orders when they desire any particular friend to see them.

Subscribe for the
Mining and Scientific Press.
PUBLISHED EVERY SATURDAY,
At No. 414 Clay Street, San Francisco.

If you are an Inventor, Patentee, Miner, Farmer, Manufacturer, Mechanic, or a progressive Student or Artisan in any Industrial or Professional Calling in the Pacific States or Territories, you are doing yourself irreparable injustice, if not already a subscriber and reader of the MINING AND SCIENTIFIC PRESS.

It contains hints and information enough to repay the subscription price many times in a single month.

Its columns are filled with instructive reading in plain, comprehensible and attractive form to minds of ordinary intelligence.

It contains 16 pages and 64 columns of the size of Harpers's Weekly, and is the best printed and most valuable paper on the western half of the continent. All claims of patents issued to inventors on this coast are reported. Illustrations of new machinery are given each week. Descriptions of new inventions and discoveries, throughout the world, are given, with fresh and comprehensive information of scientific developments and mechanical and industrial progress, which cannot be obtained from books, or readily found gathered in so convenient a form elsewhere. Subscribe now, and you will not regret it. Price $5 per annum.

Mining and Scientific Press,
San Francisco.

CIRCULARS FREE.

Assignments.

We make out assignments in the most substantial legal and improved forms, record the same in the Patent Office at Washington, and return the papers to the assignee, at a total cost of $5.

Assignments of extra length or of a special character, will be made out and recorded on the most favorable terms.

Assignments already made will be examined and opinions rendered regarding their validity, and the assignments recorded, when desired, for a moderate fee.

Unsuccessful Applicants.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Our long experience as editors and publishers M. & S. P. guarantees our familiarity with most of the subjects of patents on this coast, and insures inventors a more ready understanding of their cases than they can secure from any other quarter.

It is not the duty of any government official in or out of the Patent Office to prepare patent papers, or make models. These must be provided by the applicant or his attorney, according to law, *otherwise his claim will not be considered.*

Our Office.

The office of the MINING AND SCIENTIFIC PRESS is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room counting room, and news paper printing office — all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number —414 Clay street, below Sansome

Home Counsel.

We are frequently consulted by persons who have rejected cases which they sent months previous through distant agencies—(hastily paying their first and last government fees, expressage, and extraordinary charges of agents)—when we could have shown in the start precisely similar drawings and descriptions in the Patent Office Reports in our office, thus saving such applicants their useless expenditure of money and their long suspense.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive free advice of importance to them, from a short call at our office.

In Our Library

We have the only complete set of U. S. Patent Office Reports (from 1844) on this coast; a full record of all patents issued since 1790; Record of British patents from 1801, and full files of scientific papers containing illustrations and list of U. S. Patent Claims; Illustrated Mechanical, Philosophical, and Law Books and Reports, of the very highest authority, forming the only extensive library of patent works west of the Rocky Mountains. We offer patentees and inventors the free use of these books at our office. The files of the MINING AND SCIENTIFIC PRESS contain the claims of the Pacific Coast Patents, and many illustrated descriptions of the same. We have also in our office *full copies* of a large majority of the patent cases emanating on the Pacific Coast.

Copies of Patents.

Full copies of U. S. Patents will be furnished in the shortest time possible, at favorable rates.

Copies of the claims of U. S. Patents will be furnished without delay, from the reports in our office, at trifling expense. State the name of patentee and assignees, and date and No. of the patent, if possible.

Copies of Patents in foreign countries expeditiously furnished at moderate rates.

EXTENSIONS.—U. S. Patents issued prior to 1861, are subject to extension for seven yeas, provided some ostensible reason can be shown the Government for so doing. Patentees who have, from circumstances beyond their control, been deprived of the full benefit of their patents for any considerable time, are usually successful in obtaining an extension of the same, when presented through our agency.

INFLUENCE AT WASHINGTON.—No inventor can possibly have better facilities or more influence (through friends or agents, at Washington or elsewhere), to secure their patents sooner or more surely, than ourselves. Our influence at Washington is unrivalled, so far as success for applications from the Pacific States and Territories are concerned.

Illustrate your Inventions.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the columns of the MINING AND SCIENTIFIC PRESS. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our clients no more than the price of a first-class engraving.

Superior Engraving Done.

We have superior draughtsmen employed in our office, and take especial pains in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advise and assistance, in getting up their circulars, advertisements, etc.

With a poor representation we desire to have nothing to do, as it would be calculated to injure both the inventor and ourselves.

Too many ingenious inventors lose the product of their genius and labor by not bringing their improvements conspicuously or plainly enough before the public—the general reading public.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

More valuable patent rights have been sold on the Pacific Coast by reason of the information given of them by illustrations in the MINING AND SCIENTIFIC PRESS, than through any other source. The cost of such illustrations is little in comparison with the satisfaction gained.

DEWEY & CO.,
Publishers and Patent Agents, No. 414 Clay street below Sansome, San Francisco.

Advertising and Subscription

Rates for the Mining and Scientific Press.

Subscriptions in Advance:—One year, $5; Six months, $3; Single copies 12½ cts; Monthly Series, $5 per annum; QUARTERLY SERIES (stiff paper binding) $6 yearly.

Lowest Rates for Advertising:

We shall adhere to the following rates (payable in gold coin) for advertising in the MINING AND SCIENTIFIC PRESS from this date:

One column, one year	$400 00
Half column, one year	200 00
One column, six months	200 00
Half column, six months	100 00
One column, three months (13 weeks)	100 00
Half column, three months	60 00
Per line (smallest type) one year	3 00
Per line (30 lines or more) one year	2 40
Per line, three months	1 00
Per line (10 lines or more) three months	80
Per line, one month (4 weeks)	50
Per line (10 lines or more) one month	40
Per line, one week	25
Per line (10 lines or more) one week	20

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form; we will otherwise assist advertisers in getting up their notices, when desired.

☞All advertisements in the PRESS appear in both the ☞MONTHLY AND QUARTERLY SERIES of the MINING AND ☞SCIENTIFIC PRESS, which (by special arrangement) are ☞placed for FREE READING in the principal hotels, steam- ☞boat and steamship saloons, depots, and public reading ☞rooms and libraries in San Francisco, and the Pacific ☞States. Many volumes are also bound, thus affording ☞permanent advertising.

The PRESS now receives the largest and best advertising patronage of ANY WEEKLY PAPER west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—*our advertisers.* Better referees, or more reliable names, cannot be found in the advertising columns of any newspaper in the world.

Volunteer Compliments.

From an endless series of appreciative testimonials and frank acknowledgements, we give the following:

"TIDAL WAVE" OFFICE, SILVER CITY,
IDAHO TERRITORY, July 27th, 1869.

MESSRS. DEWEY & CO.—GENTLEMEN:—Allow me to express my high appreciation of the ability and business management of the Mining and Scientific Press Patent Agency, and to say that our business relations have been marked with the utmost promptitude upon your part and with entire satisfaction upon mine.

Yours, etc., JNO. S. BUTLER.

SAN FRANCISCO, May 5, 1869.—MESSRS. DEWEY & CO. Gentlemen:—Allow me to express to you many thanks for services rendered me in procuring my patent, which has just come to hand. I would also say that your work has been faithfully done, and your advice and representations have in all cases been honest and truthful.

Respectfully, GEO. INWOOD.

SUISUN CITY, Cal., June 26, 1869.

MESSRS. DEWEY & CO:—This is the third time you have presented me with Letters Patent within twelve months. Gentlemen, you have done all I have asked of you—you have been honest; you are men that an inventor can rely upon for doing business for him, and he need not fear of being swindled or wronged in any way. I would give you business to do in your various departments in preference to any one else. Many thanks to you for your success. You have obtained valuable patents for me, and I appreciate your kindness, your honesty, ability and success. Yours, RICHARD KNOTT.

PORTLAND, Oregon, May 2, 1869.

MESSRS. DEWEY & CO—*Gentlemen:*—Receive my kindest thanks for your attention in the matter of bringing my application for a Patent to a successful issue.

THOMAS MANN

GRASS VALLEY, Dec. 2, 1868—*Messrs. Dewey & Co.*—Having received the patent for Symons & Co's Tossing and Refining Concentrator, through your Agency, we return our sincere thanks to you for your unrivalled success. Yours, respectfully, SYMONS & HARRY.

LEXINGTON, April 3, 1869.

DEAR SIRS:—The Letters Patent have just come to hand. For the prompt and business-like manner with which you have put the matter through, please accept my thanks. GEO. W. TEASDALE.

To DEWEY & Co., Publishers M. & S. Press.

STOCKTON, April 8th, 1869.

MESSRS. DEWEY & CO.:—Your favor of the 6th inst., accompanying patent for improvement in horse shoes, is received. I beg you will accept the earnest assurance of my gratitude for your kind assistance and valuable services. Very truly yours, W. R. WATSON.

SOMERSVILLE, CAL., August 26th, 1869.

MESSRS. DEWEY & CO.—Dear Sirs: Allow me to return you my thanks for the very able manner in which you have conducted the business entrusted to your care. You will please forward the document (British Patent) by Bamber's Express to this place. Yours, respectfully, GEO. HAWXHURST.

MARYSVILLE, CAL., August 13th, 1869.

MESSRS. DEWEY & CO.—GENTS:—Enclosed find $20 (currency) for last fees on patent for gang plow. I am very much surprised, after opinions received from Munn & Co. I am, respectfully, yours, F. A. H.

The original of the above letter (and many others with similar reference to other agencies) can be seen at this office, in cases for which we have secured patents for inventors who had been denied patents, or who had paid for being told that they could not obtain patents. Inventors on the Pacific coast are fast learning to patronize first-class home agents, who better understand their cases and will give more thorough attention to every invention entrusted to their keeping.

JAMESTOWN, Cal., July 6th, 1869.

MESSRS. DEWEY & CO.—GENTLEMEN:—The Patent for our Ore Washer and Concentrator was duly received by express. We return you our thanks for the promptness and successful manner which have attended your efforts in our behalf. Yours, WM. G. HESLEP.

THE RIGHT STAMP!—One of our wide-awake California inventors (who has already received two patents through this office) evinces the true winning spirit in the following note:

SAN JOSE, Cal., June 29, 1869.

MESSRS. DEWEY & CO:—A few days ago I received your letter apprising me of the rejection of my case, etc. Well, under the circumstances, I will just say, "*Let 'er rip!*" and I will remember the indefatigable Zack. Taylor's advice to his soldiers—"Pick your flint and try it again." I will have to try and get even on something else. I am satisfied you have done your duty as agents. Yours, J. F. C.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

NEVADA CITY, Nov. 3d, 1868.

MESSRS. DEWEY & CO.—Gentlemen:—Your favor of the 30th ult., is just received, informing me of the successfull prosecution of my application for a patent on my "Hair Cutting Shears." Please accept my sincere thanks for the speedy and successful manner in which you have conducted the case, and believe me, as ever,

Very truly yours, LEE D. CRAIG.

SAN FRANCISCO, April 19, 1859.

MESSRS. DEWEY & CO., Patent Agents.—*Gentlemen:*—Allow me herewith to tender you my sincere thanks for the efficient assistance you have rendered me in securing my patent, and other papers, as well as the promptness and energy displayed by you in our business transactions. Very respectfully yours, C. E. JAYCOX.

MAYFIELD, Cal., June 26, 1869.

DEWEY & CO., *Patent Solicitors, San Francisco*—Gentlemen:—In acknowledging the receipt of my Letters Patent, allow me to express my thanks for the skillful and trustworthy manner in which you have conducted my business before the Department at Washington. I am perfectly satisfied with the high degree of ability and integrity displayed in the management of my case, and I know of no similar agency in which I could place corresponding trust. Yours truly, J. M. JOHNSON.

DEWEY & CO.,

Apparatus for Receiving and Delivering Mail-Bags.

Our express and palace-car trains between San Francisco and the East are continually quickening their running time, and thereby bringing us ever nearer and nearer to the rest of the country. Every device which enables us to increase the speed, without overstepping the bounds of prudence, is thus a great gain for us.

With well-constructed roads, our trains could easily average thirty-five to forty miles an hour were there no stoppages, except at long distances; and thus San Francisco would be only three to four days distant from New York, instead of being six to seven, as now. It is the stoppages which consume so much time and cause so much delay. When will the day come when passengers and baggage can be transferred to and from a train when it is in motion?

This day is not so very far distant, perhaps, as some might imagine; for several devices for a similar purpose have been invented in late years. It is one of these devices—an apparatus for delivering to and receiving from a moving train of mail and express matter—that we propose to treat this week.

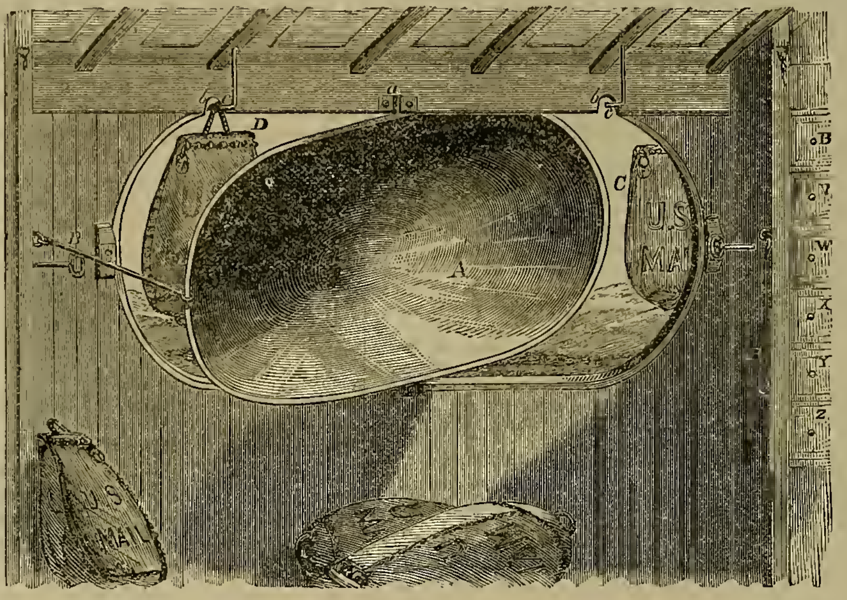
To all such devices hitherto invented, many objections have been found, which have prevented their general adoption. In December, 1868, however, Messrs. Freeman K. Sibley, of Auburndale, and Levi C. Wade, of Newton Upper Falls, Mass., received a patent for an improved apparatus, which we illustrate this week, and which has been practically tested on the Boston and Albany Rail-Road with complete success, it is claimed.

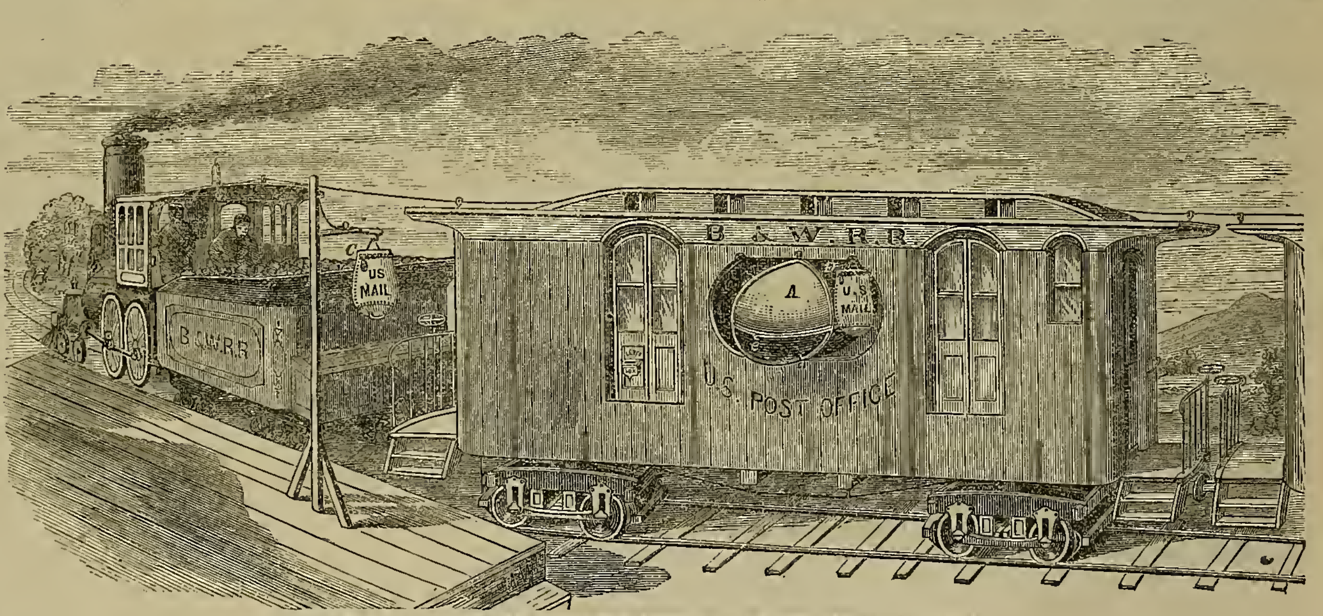
In one side of the mail-car is cut an oblong opening, in which is adjusted an oval scoop, A, by means of the pivots, a. Fastened to the inside of the car, at either end of the opening, is a rod, B, with hooked end. By means of the hook, as shown in the engraving, the scoop is held in a position at an angle with the side of the car. One or the other of these rods is used according to the direction in which the car is moving, the foremost end of the scoop always being made to project outward. At each end of the opening is a recess, b, through which projects the horizontal part of the hook, c, on which the mail-bag, D, to be delivered, is hung. This bag is suspended always on the hook towards the rear-end of the car.

The bag or parcel, C, which is to be received, is hung, at the station, on a hook, as shown in the engraving, at the proper height and the proper distance from the track.

As the car passes, the forward end of the scoop catches the bag, C. and removes it from the hook on which it is suspended, whereupon the velocity of the car causes the bag to strike the inclined surface of the rear part of the scoop with sufficient force to disengage the hooked rod, B, and throw this rear part outward until the scoop is parallel with the side of the car. This motion of the scoop throws the bag, C, into the car, and at the same time knocks the bag, D, from its hook and throws it to the ground. This expulsion of the bag, D, is assisted by means of a small hook-shaped arm, against which the lower part of the arm rests when suspended.

The result of a trial of this apparatus on the Boston and Albany Railroad, which we find with the illustrations in the *American Artisan*, New York, is given as follows: "The new method was tested on a train going from Worcester depot. Bags were taken up at Newton Corner, Newtonville, West Newton and Natick; and at Auburndale, a basket containing a live dove, two bottles of wine, wine-glasses, etc., was easily scooped up while the train was proceeding at its average speed—thirty-three miles an hour. The dove was uninjured, and the bottles of wine were found intact. Wherever the bags were suspended at the proper distance, the experiment was thoroughly successful."





SIBLEY & WADE'S APPARATUS FOR RECEIVING AND DELIVERING MAIL-BAGS.

◆

Gold in Lapland.—It is reported that two old California miners found, last summer, in Lapland, a gold nugget, worth 93 marks. Their whole summer's work yielded 60 ounces. An Australian miner has now joined them, and the three are trying to get permission from the government to continue the business.

Influx of English Capital.

Our mines are attracting the attention of European capitalists, and already several have passed into the hands of English companies. This is but the beginning; we have plenty of developed workings, which, if properly managed, will surely yield profits large enough to attract foreign capital. Other nations are content with a smaller rate of interest than has been usual here, and if too gross deception is not practiced, and this may be attempted, unless only reliable information is demanded, we may expect to have our mining operations carried on to a large extent by foreigners.

During the past few weeks, several miners have called at our office and shown specimens of ore—and some very promising ones, too—from mines which they are anxious to dispose of in part or wholly. In every case they expressed a preference for English capital over American, because they regarded mining capitalists here as merely speculators, and were rather afraid of many of them.

This practice of regarding mining as a speculation only, and not a business, has gone too far, and must be stopped. It is ruinous to the industry specially, and to our credit generally. That our mines are considered paying investments is shown by this influx of foreign capital, after an inspection by experts. Shall we always refrain from regarding these presents of nature as mere inducements to deceive one another?

Dressing of Ores—A Freiberg Process.

[Written for the Scientific Press.]

The subject of dressing ores has received too little attention in our country. Miners generally have worked only for the day, not intending to spend many years in the business, and trying to get out as much precious metal as possible in a short time, even at a great waste. This way of working answers perhaps for the early days of mining; but a more careful and precise method must finally be adopted; and the sooner this is done, the better for the country. Many mines which cannot now be worked at a profit might still be very lucrative if they had been properly worked at first.

For mining improvements we naturally look to older countries, where mining has long been a business. All our most valuable hints have thus far come from other lands. The American really *originates* but few theories or principles; but he has a wonderful power of adapting, and making practical, old ideas, which, perhaps, have never before been successfully carried out.

It is with the idea of saying something, from which useful hints may be extracted, that it is proposed to give one or two examples of the way ores are treated in Freiberg. Of course no whole process can be bodily imported from a country where labor is as cheap as it is in Germany. Still it is thought that many of your readers who cannot go to Europe will be glad to hear through your columns of what is really being done in the old world, there being no English work extant which gives the details of the processes used. [Küstel's book comes the nearest to this.—Ed.]

The Chur Prinz Mine,

Near Freiberg, will be taken as a good example—this mine belonging to the government, and being worked for the purpose of promoting mining interests in general, rather than of bringing in a special revenue. It is situated about five miles from Freiberg, close to the Mulde river; and in its general characteristics is nearer, perhaps, to the mines of Austin than to any others on the coast. The ore is principally argentiferous galena (with some gray copper ore containing silver), which occurs with iron pyrites, quartz, fluorspar and heavy spar. The country rock is gneiss. It is to be understood that the ore would be considered worthless here, not being rich enough to be worked; but it must not be forgotten that the price of labor, on the other hand, is also very low.

Separation in the Mine.

In the mine the ore is separated into three classes, and these are hoisted out separately. They are: Class A, "separation ore;" class B, stamp mill ore; class C, barren rock. At present, only the first class will be spoken of, as class B undergoes a distinct treatment, and the following remarks apply to this class (A) only.

Reduction to a Proper Size and Sorting.

The ore is first crushed in an ore-breaker modeled after Blake's patent. The jaws of the machine play to and fro 213 times per minute, and are about 1¼ inches apart. The ore is thus broken up into pieces which range up to 1½ cubic inches in size. These pieces are broken up finer, to ½ cubic inches, in a second ore-crusher which plays 256 times per minute, and whose jaws are ⅜ inch apart. It is thought that by crushing first more coarsely and then more finely, considerable is gained in an economical point of view.

The crushed ore now falls into a set of four sieves, or swinging riddles, and is sorted into five classes. The sieves have a length of 8½, 8, 6⅓ and 4⅔ feet, and meshes 5-16, 3-16, 2-16 and 1-16 inches wide respectively. The swing is six inches. The finest dust is washed in a hand buddle, which is 12 feet long, 30 inches wide, and 22 inches deep; the rest go to the jigging machines, except that which will not pass through the coarsest sieve. This is carried by an elevator—consisting of buckets attached to an endless band—to a rolling mill. This consists of two cast iron rollers, 9 inches wide and 14 inches high, which require about two horse-power to drive them at the rate of 39 revolutions per minute. The ore falls through into a cylindrical trommel or drum, which revolves 13 times per minute and sorts into 5 different classes, the sieves having meshes respectively ¼, 3-16, ⅛ and 1-16 inch wide. The finest product is washed in the hand buddle; the others are jigged.

These special details are given because a proper sizing of the grains is all important for the following processes, and too much stress cannot be laid on this point. Could the grains be obtained of *exactly* the same size, an almost perfect separation would follow.

It is not to be expected that we can work so thoroughly in this country, where labor is so high; but still many will see how these and other processes may be shortened and cheapened to suit our circumstances, and yet do valuable work. Up to this point almost no manual labor is required, except in overseeing the working of the machines. Several workmen are employed at the mine spoken of, but their numbers could easily be reduced to two or three.

The Jigging Machines.

The ore has now been sorted into four classes, according to the size of the grains. These are carried to four different sets of jigging machines. The sieves of the first four machines have 16 meshes per square inch; the second, 25 meshes; the third, 36 meshes; the fourth, 64 meshes. The stroke is about seven inches. All 16 machines use eight cubic feet of water per minute. But only half are at work at one time, as while one is working, the other is being cleaned out by the boy who has charge of a set of two. It takes three and a half to four minutes to treat each charge. In this country we would hardly be contented with these machines.

The jigging gives as products: 1st. Barren ore. 2d. Small grains, in which are still particles of ore mixed with rock, and which must be stamped finer with other stamp mill ore (to be described hereafter). 3d. Galena ore, which is pure enough to be sold. This contains 75 per cent. lead and about 0.05 per cent. silver, or about $19 to the ton.

To drive all the machinery described, there is a 12-horse power steam engine, with 14½-inch cylinder and 2½ feet stroke.

[TO BE CONTINUED.]

◆

Air in Gas.—Professor Silliman and Wurtz have been investigating the effects of atmospheric air upon the illuminating power of gas, with, according to the *Chemical News*, the following results: "For any quantity of air less than five per cent., mixed with gas, the loss in candle power due to the addition of each one per cent., is a little over six-tenths of a candle (0·611 exactly); above that quantity the ratio of loss falls to half candle power for each additional one per cent. up to about twelve per cent. of air; above which, up to five per cent., the loss in illuminating power is nearly four-tenths of a candle for each one per cent. of air added to the gas. With less than one-fourth of atmospheric air, not quite fifteen per cent. of the total illuminating power remains, and with between thirty and forty per cent., it totally disappears."

The Comte Philosophy.—"In the theory of positivism there is no room for metaphysics, nothing for the metaphysician to do. Positivism has to do not simply with the facts of science, the phenomena, but it aspires to be a general philosophy which shall express in a single formula a universal truth respecting all phenomena. It says you cannot know the absolute, the infinite; but you can, by searching, find out the general law. It here sets its limit to speculation, and rules out the metaphysical and the supernatural; or, if it is going to far to say that, it holds a position of indifferentism toward the supernatural. It builds its universal philosophy, if not wholly upon the material, yet upon a necessary union of thought and matter. It admits no fact outside of experience."—*Courant.*

Deep-Sea Sounding and Dredging.

[Reported expressly for the Scientific Press.]

The regular monthly meeting of the New York Society of Practical Engineering was held at the Cooper Institute, N. Y., on Wednesday evening, December 8th, President James A. Whitney in the chair. The subject of "Deep-Sea Sounding and Dredging" was discussed in an elaborate paper, by Prof. William Robinson, of Brooklyn.

In his opening, the writer alluded to the rapid advancement of science within a few years, and the mutual dependence of the physical sciences. Marine geology has received a new and important impulse since the laying of telegraph cables made it necessary to sound and dredge the ocean. But science has done comparatively little, as yet, by its researches in the ocean depths. As sounding and dredging, however, are an absolute necessity for the advancement of marine science and as a preparation for laying cables, it is of the greatest importance that the most perfect sounding devices should be invented. None heretofore used have been free from objection.

The earliest sounder used was the common lead and line. It answers for shallow water, but is not reliable beyond a depth of three or four hundred fathoms. In 1818, Sir John Ross procured shells, shrimps and other crustaceans from the bottom of Baffin's Bay, in water more than 650 fathoms deep. In 1830, Vidal carried dredging successfully to a depth of 200 fathoms, and in 1841, Admiral Sir J. C. Ross procured a variety of invertebrate marine animals from the bottom of the Antarctic Ocean at a depth of 270 fathoms. But all the old sounders were crude, and could not be used successfully in very deep water.

America has been the pioneer in deep-sea sounding, and it was not until 1853 that the secrets of the *deep* ocean bed were revealed. In that year, Midshipman Mitchell, on board the U. S. brig Dolphin, brought up ooze composed of the remains of microscopic animals, from the bottom of the Atlantic, where the water was 1,700 fathoms, or about two miles deep.

Devices for Deep Sounding.

The device heretofore most extensively used in the United States, and, with some modifications, also in the British Navy, for deep sounding, is an invention of Lieut. Brookes, of the U. S. Navy. It consists of a rod, to the upper end of which is attached a heavy ball, hollowed out to receive it, the lower end of the rod being provided with a cup containing a valve. When the instrument strikes the bottom, the ball falls off, the cup fills with the ooze of the bottom, if soft, and the machine is hauled up. It weighs only a hundred pounds, yet a 12-horse engine is required to haul in the line at a depth of two miles.

Various other devices have been proposed. One attempted to ascertain the depth by exploding a heavy shell at the bottom. The time of the explosion and the time of the sound reaching the surface being known, the depth could readily be calculated. This method seems to have been successful in shallow, but in deep water it was an utter failure, as no sound could be heard. Attempts have been made to dispense with the line—a very desirable thing to be accomplished, because of the expense attending its use.

One of the latest inventions is on the atmospheric pressure principle, by Dr. A. W. Hall, of New York City, and dispenses with the line. It consists of a tube closed at the top and open at the bottom, into which is inserted a graduated rod. As the instrument sinks, the increasing pressure causes the water to rise in the tube and dissolve a substance coating the rod for the purpose. The height to which the water rises is thus marked on the rod and the depth indicated. The apparatus is carried to the bottom by a sinker, which is automatically detached by striking the bottom, and the instrument then rises by a float.

Instruments constructed on the principle of the screw propeller have been tested and failed, chiefly because the registering device could not be constructed sufficiently delicate, and at the same time strong enough, to resist the pressure and action of the water upon it. An instrument of this class, lately invented, was exhibited at the late Fair of the American Institute. The spiral blade is hung in an open framework, provided with outwardly projecting vertical wings, to prevent the whole machine from turning as it descends to the bottom. The blade being in an open frame is subject to the action of side currents, and the registering device is open to the objections which caused the failure of other instruments of this class.

The writer, while preparing this paper, invented two new sounding instruments. The first consists of a tube open at both ends, expanding about the center for the reception of a wheel, which moves on a horizontal axis. Above the tube is situated an air chamber open at the bottom; in the upper part of this chamber is located a registering device, which is connected with the axis of the wheel. The instrument is kept in a vertical position by constructing it so that the center of gravity is below the tube. An automatically detachable sinker carries the instrument to the bottom. As it descends, the revolutions of the wheel record the depth. When the bottom is reached, the sinker is detached and the wheel locked. The wheel, protected by the tube, and moving on a horizontal axis, is free from the action of side currents, and the registering device being free from all contact with the water, records as accurately in the compressed air as in the open air. The air chamber not only protects the registering device, but it also answers as a float to raise the instrument. The other instrument is constructed on the pressure principle, and it is claimed will record the depth, however great, to a foot. In instruments constructed on the pressure principle, there is no danger of collapse when the pressure is equalized within and without. In connection with any of the above instruments, ordinary dredges may be used.

As soon as the paper was concluded, the chair called upon Dr. Hall, who came on the platform and explained a full-sized bathometer, on the atmospheric principle, as described in the paper. Mr. J. Fisher described a bathometer invented by Capt. Ericsson, and exhibitad before the American Institute about the year 1839. This device registered the depth of the ocean by the compression of a column of water and filling the space thus made vacant by mercury from another vessel. This small quantity of mercury, when weighed, approximates the depth to which the apparatus had descended. Some scientists doubt the compressibility of water, alleging that the apparent compressibility results from the air contained in the water and the porousness of the vessel containing it, though Jacob Perkins, some forty years ago, had demonstrated that water could be compressed perceptibly. If water is compressible, a column a mile deep would be considerably heavier at the bottom than at the top, and would require a scale to be calculated accordingly, to estimate the depth, if the machine exhibited by Dr. Hall should be used.

Dr. J. V. C. Smith spoke at length on a geological formation that had attracted his attention, containing shells imbedded in solid limestone that were once, evidently, the bottom of the ocean. His description of such formations found in the stones of the great pyramids of Egypt, called forth applause. The meeting adjourned till the 12th of January.

◆

Artificial Light.—The German chemist, Landsberg, says that artificial light contains 90 per cent. of calorific rays, while sunlight contains only 50. To this difference he ascribes the disagreeable effect of artificial light upon the eyes. By passing the light through alum or mica, the calorific rays are intercepted, and this unpleasant effect is obviated.

Mechanical Progress.

American Machine Products Abroad.

The Remingtons, of Ilion, N. Y., have furnished the Danish Government 25,000 of their breech-loading rifles, and the Swedish Government, 25,000; this year they will send to Europe 100,000. Colt's Co. is completing 30,000 Berdan rifles for Russia Col. Berdan has gone to Russia to superintend a factory there, for altering their present arms. Turkey has bought 200,000 of our rifles, and over $60,000 worth of machinery, with which to convert them into breech-loaders. The Winchester and Remington rifles are being sent to China and Japan. Nearly one-half of the entire product of Smith & Wesson's pistol factory, employing 300 hands, is sold in Europe—mainly in France, notwithstanding their cheaper labor. This result is of course due to the fact that they are mainly the product of *machine* labor, which machines are themselves of American invention and manufacture, and which produce an accuracy of work and finish that their hand labor cannot equal. The Union Metallic Cartridge Company, of Bridgeport, Conn., is furnishing cartridges to nearly all the world. They had one order of 25,000,000 from the Russian Government, and it is reported that the order has been increased to 100,000,000. They make them of every variety and size, their sale of one small size for pistols averaging 45,000 per day, a large portion going to Australia. And these, too, are all made on machines invented by Americans, the like of which do not exist elsewhere in the world. In addition to all this, the Windsor Company, of Windsor, Vermont, are just completing an order for $80,000 worth of milling and screw machines, to be shipped to Edinburgh, Scotland, to establish there a large factory for the manufacture of the Singer sewing machine. These milling and screw machines are also entirely of American origin.—*Tribune.*

Hydraulic Punching and Riveting.—Piggott & Sons, Birmingham, makers of gas-holders, have machinery for this work which is thus described in a late number of *Engineering:* "In the rectangular plates any number of holes up to 154, are punched at a single blow, and to the exact pitch. Originally the piston within a vertical steam cylinder of about four feet diameter, and worked with fifty pounds steam, had a rod or hydraulic plunger of four or five inches diameter, which was driven home with a force of perhaps forty tons, equal to at least two tons per inch, forcing water equal to its own solid contents into an accumulator, from which it was let on, as required, to a pair of vertical nine-inch rams, placed over the bed of the punching machine. These drove down the head, carrying the punches, which were turned with shanks of a diameter equal to the intended pitch, and secured in rows, and with their shanks in contact,* in grooves properly formed around the punching head. Each alternate punch was made three-eighths inch longer than its neighbor on either side, so that although a single blow sent all the punches through the plate with a single report like that of a pistol, but one-half of the punches actually went through at once. The work thus done was exact, indeed perfection. Instead of the large steam cylinder, a pair of rotative 'pumping engines are now employed, the working pressure being thirty-five hundred weight to two tons per square inch. The hydraulic riveting is performed also by hydraulic pressure, at an average rate of thirty rivets per minute, the rate often rising, for a short time, to one per second."

Micrographs.—These are photographs of magnified objects, and are produced by combining a microscope with the camera. A correspondent of the *Scientific American* describes a cheap arrangement of his own for the purpose. Over the eye-glass tube of an ordinary achromatic microscope, he places a sleeve or ferule, to which is attached a small box, having its rear part open to receive the plateholder, which fits closely. The interior of box and plate holder is painted black. In focusing, a frame with ground glass takes the place of the plateholder.

Non-porous Castings.—It is said that if the plumbago crucibles in which copper is melted be first lined with pipe clay, and dried, non-porous castings may be obtained. It is the presence of carbonaceous matter which causes the sponginess.

Chrome Steel.

J. H. Corbin has an article in the *American Journal of Science and Arts*, on certain specimens of chrome iron and steel examined by him in the laboratory of the Lehigh University. We give his description of the steel, omitting the result of the analysis: "The chrome steel is a compound possessing some peculiar properties, a marked one being that of assuming a highly crystalline structure and cracking badly when tempered at the usual heat for tempering steel; but at a low red heat, a product of very fine grain is the result. Another property is, that it may be submitted to considerable torsion without breaking. A bar twenty-four inches in length and one-half inch square, was twisted while cold by two men at the end of a powerful lever two and one-half feet in length, until the lever described three complete circles. The twisted bar was now bent in the shape of an ellipse until the ends touched; on examination no injury to the steel could be detected, as it appeared to possess the same properties after as before the operation. The steel is very hard. The hardness of a tempered specimen is equal to that of quartz, and that of an untempered specimen to that of feldspar. The density of the tempered specimen is 7.79, and that of the untempered one 7.8. The density of the latter, however, had been raised by its having been struck with a hammer. Its fracture is white, conchoidal, and very fine in structure.

Aluminum and its Alloys.—An alloy of seven per cent. of iron with this metal does not perceptibly lessen its toughness. With ten per cent. of copper, aluminum still remains ductile. If alloyed with small quantities of zinc, tin, gold or silver, the metal is rendered hard and more brilliant, but remains ductile. Especially recommended is the alloy, consisting of ninety-seven per cent. of aluminum and three per cent, of zinc. The alloy with seven per cent, of tin can be worked well, but does not take a very fine polish, and cannot be cast. since a more fusible alloy with a large proportion of tin is separated. Aluminum and lead do not unite. The composition with three per cent. of silver and ninety-seven of aluminum, possesses a beautiful color, and in equal parts they yield an alloy of the hardness of bronze. The union of ninety-nine per cent. of aluminum and one of gold is, though hard, still ductile; its color is that of green gold. With ten per cent. of gold the composition is rendered crystalline.

Another Road Locomotive.—*Engineering* illustrates a new road locomotive designed by Mons. J. F. Cail. We quote a portion of the description: "The boiler and water tanks are independent of the mechanism and easily dismounted. The mechanism placed under the boiler is within longitudinal frames, and is provided with reversing gear and a brake. The fire-box is placed at the same end as the fore carriage, which brings the engineer and conductor together, they being both covered by the same roof, and, having within reach all the driving gear, can help each other if need be. This arrangement also enables the engine to be worked entirely by a single attendant. The water tanks and fuel bunks are carried by the steering wheels, which alone sustain the variations of weight of these parts when in use; whilst the driving wheels carry a load which never varies, and this gives the engine a tractive power which is always constant on the same kind of ground."

Powerful Turbines.—A correspondent of the *Odd-Fellow* thus describes the turbines in the Mastodon mill, Cohoes, N. Y: "The number of looms is 1,486. These are driven by three 'immense turbine water wheels, which possess an aggregate driving capacity of over 1,100 horse-power. Three mammoth cast iron cylinders, eight feet in diameter, convey the water from the canal to the wheels. The perpendicular shaft of each turbine is connected with the main shaft by beveled gear. The shaft to which this power is applied is supported by three granite abutments, and forms the axis of six ponderous driving pulleys, twelve feet in diameter. The immense belts which radiate to all parts of the building are in keeping with the massive pulleys and gearing. These are each two feet wide, and the longest one, reaching to the fifth story, measures nearly 200 feet."

Scientific Progress.

Muller on Darwin.

From the opening portion of Fritz Müller's "Facts and Arguments for Darwin," derived from an application of his theory to the class of Crustacea, we quote the following:

"A false supposition, when the consequences proceeding from it are followed further and further, will sooner or later lead to absurdities and palpable contradictions. During my period of doubt, I took no small pains to detect some such contradictions among the inferences as to the class of Crustacea furnished by the Darwinian theory. But I found none, either then or subsequently. * * Nor, so far as I am aware, have any of the *necessary* consequences of Darwin's hypotheses been proved by any one else, to stand in clear and irreconcilable contradiction. And yet, as the most profound students of the animal kingdom are amongst Darwin's opponents, it would seem that it ought to have been an easy matter for them to crush him long since beneath a mass of absurd and contradictory inferences, if any such were to be drawn from his theory. To this want of demonstrated contradictions I think we may ascribe just the same importance in Darwin's favor, that his opponents have attributed to the absence of demonstrated intermediate forms between the species of the various strata of the earth. Independently of the reasons which Darwin gives for the preservation of such intermediate forms being only exceptional, this last mentioned circumstance will not be regarded as of very great significance by any one who has traced the development of an animal upon larvæ fished from the sea, and had to seek in vain for months, and even years, for those transitional forms, which he nevertheless knew to be swarming around him in thousands."

Photography in Transit Observations. In Prof. Alfred M. Mayer's report of observations made upon the August eclipse, he makes some remarks upon the prospective value of photography in determining the lines of contacts during the coming transits of Venus in 1874 and 1882. He says: "It has been shown that the sun's image was photographed on the camera plate with an exposure of only 1-500th of a second; and the duration of exposure for any other instrument can be determined with as great precision. The instant the mechanical movement exposes the plate, it also records the time of that exposure on a chronograph connected with a break-circuit clock, and thus we have an accurately delineated *figure* of the transit corresponding to a *time* marked on the face of the clock employed; and this correspondence of figure and time is unaffected with personal equation either of sight or of hearing. Now if the error and rate of the clock can be entirely freed from the personal equation of the observer who determined them, and if the longitude of the station be found by the coincidences of the beats of a sidereal clock with those of break-circuit mean solar clock placed at the observatory of the first meridian, we have the most accurate means of obtaining the *absolute* times of contacts at the station of observation."

Theory of Comets.—Prof. Daniel Kirkwood, in an article in *Silliman's Journal*, says: "The theory of comets now generally accepted is, that they enter the solar system *ab extra*, move in parabolas or hyperbolas around the sun, and, if undisturbed by the planets, pass off beyond the limits of our system to be seen no more, If in their motion, however, they approach very near any of the larger planets, their direction is changed by planetary perturbations; their orbits being sometimes transformed into ellipses. The new orbits of such bodies would pass nearly through the points at which their greatest perturbation occurred; and accordingly we find that the aphelia of a large proportion of the periodic comets are near the orbits of the major planets."

Paper Belting.—"It does not stretch, nor change shape, can be made into one piece of any desired length and width and thickness, and is uniform in every particular. It hugs the surface of the pulleys closely, generates no electricity when running, is sufficiently flexible to pass over six-inch pulleys without cracking, and is not injured by the heat, dust, oil or moisture incident to ordinary use, and is forty per cent. cheaper than leather."

Carbolic Acid vs. Alcohol for Specimens.—At a recent meeting of the Chicago Academy of Sciences, Dr. Stimpson gave the result of three months' experiments upon carbolic acid as a substitute for alcohol in the preservation of wet specimens. He found that deliquesced crystals of the acid dissolved in forty times its bulk of water gave a fluid which equaled alcohol, in its preservative qualities, at less than one-twentieth its cost, with the additional advantage of keeping the specimen far more nearly in its original condition. In a solution of twice that strength, the specimen itself is soon destroyed. Specimens should be first placed in a very weak solution, say one-half per cent.; but as the action of the acid is very rapid, it may be daily changed for a slightly stronger one, until the full strength (two and one-half per cent.) is reached. This should be done to prevent the contraction resulting from the sudden contact of a strong solution, and preventing endosmosis. Fluids once used will be found to have lost their preservative power far more than alcohol, and must be strengthened before being used again. The freezing of the fluid may be prevented by the addition of one-eighth part of alcohol. If the smell of carbolic acid, which is very slight in the weak solutions, should be objected to, the addition of a minute quantity of the oil of wintergreen will cover it completely.

Coal-Tar Notes.—Prof. Hoffman has been making investigations on *Naphthaline-rose*, *Aniline-green*, and relations of isomeric *Xylidine*. Several molecules of *Naphthalamine* combine to form the splendid rose color manufactured by Clavel in Basle, in a precisely analogous way as was proved to be in mixtures of bases of the Aniline series. The Aniline-green is produced together with the Aniline-violet by the action of *Iodide of methyl* on *Rosaniline*, and is to be regarded as a compound of. *Trimethyl-rosaniline* with *Iodide of methyl.*

Besides the hydrocarbons which afford the material for the products of the color manufactories, coal contains in small quantity a series of bases which have hitherto been but little studied. Dr. Baeyer has artificially prepared one of these bases, *picoline*, by the action of ammonia on *acrolein* (an aldehyde); other allied bases arise from the action of ammonia on higher aldehydes. Now, acrolein is a common product of the distillation of fats. Dr. Baeyer believes that this gives us the key to the understanding of the natural origin of these bases. They are produced by the distillation of animal matters; that is, of fatty substances which at the same time give rise to ammonia.—*Academy.*

Protoxide of Nitrogen.—M. Limousin has recently published a paper on this subject. He finds that water at the temperature of 4° or 5° C. will dissolve its own volume of this gas at the ordinary atmospheric pressure. A bottle containing about equal quantities of the gas and cold water was violently shaken; the stopper was forced down into the bottle with a detonation. Under pressure, several volumes of it will be dissolved by the water. Ether, kept at a temperature of twelve degrees below zero, C., by a freezing mixture, is capable of absorbing eight times its volume of this gas. Prepared under these conditions, the saturated ether acquires remarkable properties. It volatilizes with so much greater rapidity than pure ether, and produces thereby such a diminution of temperature that it would probably produce very energetic effects if applied to produce local anæsthesia.

The Big Mound of St. Louis.—Prof. Spencer Smith, in a paper read before the Academy of Science in St. Louis, states that the noted "Big Mound" has at last been laid low, and its substance used to grade a railroad. The destruction of the mound gave an opportunity to study its structure, and Prof. Smith is satisfied that it did not belong to the group of artificial mounds, but was simply a river deposit, formed of parallel and horizontal strata of clays and sand, the same as found on the banks of the river. But few relics were found during the removal of the mound, and nothing, Mr. Smith thinks, that would indicate anything more than that the Indians took advantage of the mound to bury their dead as they would in any high place,

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

M. C. Tunnel.—*Miner*, Dec. 18th: Hard rock has set the boys back for some days. Several bodies have been cut and ore can be taken out at any time after a process is decided upon. Lumber for the chute to convey ore to the road, is being delivered.

Stetefeldt.—This furnace has been inspected with reference to its use on our ores, and it is thought this plan or something similar, will be just the thing for Alpine.

Pennsylvania.—The result of the working of some ore from this mine, as per certificate of W. T. Rickard, is as follows: Value per ton, silver, $97.40; gold, $5.26; total, $102.56.

AMADOR COUNTY.

Kennedy.—*Dispatch*, Dec. 25th: It is rumored that this mine has been sold for $80,000. We know that some very rich rock has been taken out lately.

New Works.—Burr and Breedlove are erecting new chlorination works, at Sutter Creek. These gentlemen have an oven already in operation, but its capacity is not sufficient to meet the demand on them for working sulphurets.

Coney.—We learn from good authority that work will be resumed on this mine between this and the first of March.

Placer Mining.—Very little of this has been done in this section for ten years, and it is the opinion of good miners that good diggings can yet be found. The price of water is not so high as formerly.

CALAVERAS COUNTY.

Items.—*Chronicle*, 25th: The claim of Brackett & Co. is again being worked. A number of hands are drifting, and the mill is kept constantly running....Charles Harkins has sold out to Counelly & Brennan. During the past six months this mine has paid a profit of nearly $15,000.

Glencoe District.—Barney & Co. have cut the vein with their drain tunnel, and are taking out very rich rock. Timhy & Howarth have had a crushing of 40 tons of rock that yielded $30 per ton. Peter Gass has struck a vein—parallel with Barney & Co's claim—the rock of which is said to be held together with gold. This is the ninth rich claim Gass has found in the past year.

Railroad.—Quartz claims turning out well and work vigorously pushed. The mill on the Petticoat is progressing finely—boiler in place, engine set up and the building nearly completed. It is rumored that Mr. Gashwiler will commence operations on the claim he bought from the Lewis Brothers about New Year. Houston & Poe had 40 tons of rocks, recently, which netted $800.

Monitor Camp.—Cor. of same: A new company have taken hold of the old Merrimac claim, erected an engine, and are about ready to recommence sinking. Bigelow, Wright & Co., in the Monitor claim, have struck richer gravel than has ever been taken from the mine before. They are sinking a new shaft. The adjoining claim on the north has been located by Evans & Co., and operations will be shortly commenced. The Jackson Co. are taking out rich gravel, as usual. The Harkins mine continues to pay as well as ever. Last Saturday they had another large clean up—over three hundred ounces of gold—the result of the labor of eight men five weeks. I was shown a piece of rock from the Davis claim, Central Hill, that was about half gold. With a shaft 25 feet in depth this claim shows a load three feet wide. Mr. Davis has perfectedarrangements to work the mine next summer. Monitor will yet be the liveliest camp in Calaveras.

LOS ANGELES COUNTY.

New Placers.—*News*, 18th: We understand that rich placer mines have been discovered near the head waters of the San Gabriel, in the mountain gorges between the river and Little creek. Parties have left this city to investigate the truth of the reports.

NEVADA COUNTY.

Bullion.—*Gazette*, 22d: The Eureka Co. shipped on Tuesday to San Francisco $23,000, the result of twelve days' run of their mill.

"God's Country."—Caddy & Dower are erecting an eight-stamp mill, two and a half miles from the Jim or Mutual mine. They have a four-foot ledge. Their mill will be running in two months. The Jim run their 5-stamp mill night and day, crushing 15 tons in 24 hours. They have 1,200 cords of wood on hand, and provisions to last the winter. As the snow is deep in this region, known as "God's Country," it is necessary to have supplies hauled during the summer. Black & Young's mill is employed night and day on good pay rock, and its owners intend to keep it running all winter.

The North Bloomfield Co's Dam.—General Alexander has made an elaborate report upon this structure, showing it to be sufficiently strong for the present pressure, and pointing out what will be necessary when it is carried 15 feet higher as is intended. The present height is 48 feet.

Started Up.—Grass Valley *Union*, 28th: The machinery for the West Eureka mine was completed Saturday, and put in motion. Everything worked well and the mine was soon freed of water.

Good Rock. Same of 23d: We were shown, yesterday, some specimens from the McClellan Co's ledge. They were full of sulphurets and showed, also, free gold in coarse pieces.

Severe Weather.—The *Transcript* of the 24th says: The cold snap of the past few days has been more severe than for years. The Omega ditch is frozen from top to bottom. This has not occured before in 16 years. The miners in the upper part of the county can do nothing until a "thaw" comes.

The Idaho.—*National*, 21st: The U. S. patent for the Idaho mine was filed for record in the Recorder's office yesterday. The patent embraces a tract of seven acres and eighteen hundredths, and extends 3,100 feet along the ledge.

PLACER COUNTY.

Dutch Flat.—Cor. of the Auburn *Stars and Stripes*, Dec. 23d: "Owing to the scarcity of water, very little mining is being done, although most of the claims are ready, The owners of many claims have worked off the surface, and but few have ground that can be worked without running tunnels and opening up on a lower level; some of them hold back, waiting for capital to come in and buy them out. A company of San Francisco capitalists recently purchased the claims of the Ohio & Cologne Co.; they have been drifting and crushing the dirt with astonishing results; they intend purchasing more ground. We had an excitement a few days since in consequence of the discovery of a quartz lode on the head of Squire's Cañou; in the croppings it was very rich, but the vein was rather small and not easily traced; only two locations have been made on it; they have sunk two shafts on it with encouraging results.

PLUMAS COUNTY.

Stopped.—Quincy *National*, 18th: The Eureka Mills, at Jamison, have stopped until spring opens. The hands will be kept employed in taking out rock during the interval.

Struck Pay.—Billman & Richards, who have been running an incline tunnel near the old Great Western claims at Newtown, have found good pay dirt. As yet they have not struck bed-rock; but the gravel prospects as high as two bits to the pan.

Crescent.—The machinery having all been repaired, the mill commenced crushing rock last week.

Assessment.—The Mountaineer Co., at Sawpit Flat, has levied an assessment of $10 to the share.

SISKIYOU COUNTY.

Quartz.—Oregon *Sentinel*, 18th: Nash & Co., of the Eliza ledge, Humbug Hill, near Yreka. have just cleaned up a run of 33 tons rock, realizing 33 ounces of gold. This was from the lower level, where the lead is six feet thick, and the rock taken out as the men worked upward, making a chimney to get air.

A Rich Mine.—*Appeal*, 23d: R. L. Crary brought down yesterday, for assay, $41,000, the proceeds of the last run of the Smartsville Hydraulic Mining Co. This is the second dividend of this mine, the first being over $30,000.

Arizona.

Wickenburg.—Prescott *Miner*, Dec. 7th: Joseph Kelley informs us that the Vulture Mining Co's 40-stamp quartz mill was making money....It was rumored that Hinton & Smith had sold their mill and claim to a San Francisco company, who intended to build larger.....R. W. Groom and Geo. Monroe were running an arastra on the White Pichaco mine.

Walnut Goove.—Parties who arrived from the Grove on Wednesday, report everything lovely. C. B. Gennng had cleaned up one arastra, and got a good return from Sutler ore. He was preparing to clean up another, in which he had ground Blue Jay ore. He had also started work on the Montgomery mine. The placer miners were making fair wages.

Big Bug.—Messrs. Gray, Wunderlich and Hitchcock, arrived Tuesday, from Big Bug, to attend the funeral of their friend, Wm. Heslep. The mill will start up again Monday next.

Eureka Hydraulic Diggings.—Zadok Jackson bought the interests owned by his brothers Sol. and Cal. in these diggings, on Lower Lynx Creek, so that the "old man" now owns one-half the property. The other half is owned by Messrs. Lovejoy, Griffin, and the heirs of Mr. Shirley.

Work has commenced in the mining claims belonging to Messrs. Bean, Bowers and Wells, at the head of Lynx Creek.

Colorado.

Black Hawk.—Central City *Herald*, Dec. 15th: Logan Findley & Co. are still working the old Holdbrook mill to its full capacity. Holmes & Daws are running the 20 stamps of the Hurd mill on U. P. R. quartz. Mr. Lindsey has leased the old Holman mill and is running it on Bates & Hunter ore. Fitzpatrick and the Black Hawk Co's mill are supplied with all the ore they can crush. Kimber is running 25 stamps on California ore. M. B. Hayes has completed his additions to the New York mill, and is running 40 stamps on custom ore. The new engine works to a charm. The Consoildated Gregory and Woodbury & Norton's mills are crushing steadily.

Items.—Georgetown *Miner*, 16th: A new shaft is being sunk on the Caledonia lode....Work on the North America has been resumed....The Baker Co. shipped this week, 91 lbs. troy of silver bullion 940 fine; coin value $1,550....One ton of first-class Sterling ore was shipped to Newark, N. J., for treatment last week....Ten tons of first-class Snow Drift ore was shipped last week to Newark, N. J....Charles Bellamy informs us that two feet and a half of solid mineral has been struck in the Mendota lode, Sherman Mountain....The Sterling mine changed ownership, at good figures, a short time since....On Tuesday the Franklin Co. brought to Georgetown for melting, 235 lbs. troy of silver bullion. The assay and melting furnaces at the Co's mill will be finished in a few days.....The Baker Co. are sending 3 tons of ore to mill daily. They have let a contract to sink a 100-foot shaft.

Summit Items.—Work on the Napoleon load is revealing an unusual deposit of ore in the crevice. Milner & Black are working with good results on an extension of the Cooper lode, Collier Mountain. They have unearthed a solid vein of mineral of great width. The reduction works of the Sukey Co. on Snake river are completed.

Idaho.

Boise Mines. — *Statesman*, 16th: Ad. Quively, just returned from the mines 40 miles up the river, says work has ceased for the season on account of the freezing weather. A dozen men will winter there, sawing out lumber and making preparations for spring.

Willow Creek Mines.—Same of 18th: The new diggings are attracting some attention. Two or three hundred Chinamen are at work, and will commence mining next week. Almost all the creeks and gulches running into the valley prospect well.

Loon Creek.—*World*, 16th: Judge Shepherd's agent at Oro Grande writes: There was quite an excitement here last week about a prospect found on the Middle Fork of Loon creek, in Smith's district, three miles from Oro Grande, 25 cents to the pan and only two feet deep, with plenty of water. About 75 claims were recorded, and the prospects look favorable for good diggings.

Mining has ceased for the winter—Loon creek being frozen over in several places. A prospect has also been found in the lower discoveries. Our camp promises better than ever for another season.

Montana.

Summit Items.—Virginia *Times*, Dec. 20th. John How has workmen sinking on the Nelson, Keystone, Polar Star, and other leads at Summit. A run has been made on rock from the latter lead, with satisfactory results. Mr. How has erected a 20-stamp mill. Covelly & Co., owners in the Keystone, expect to have some ore crushed in the How mill, soon, for the purpose of testing it....The miners on Eagle Hill bar are tunneling, taking out pay dirt to wash in the spring.

Items.—*Gazette*, 14th: The Hendrie mill is running five stamps on ore from the Vawter lode, as a test. The other 15 stamps are on Union ore....On Saturday the Whitlach Park company cleaned up from one run, in Addis' ten-stamp mill, on Park ore, a neat brick valued at $4,700. Yesterday we saw another brick just out of the mould, weighing 637 ounces and worth over $13,000. This was from the Whitlach mine, and Hendrie's new mill. J. C. Ricker had a brick run weighing 327 ounces and worth over $6,000.

The Cedar Creek Rush.—Same of 22d: A private letter from Missoula says: Every body is excited with the news from the new diggings. The mines prospect from 25 cents up. I saw one piece that weighed $16. The creek is as long as Alder, and has many tributaries. Two or three of them are rich. The main gulch is called Cedar; the side gulches, Montreal, Rabbit, etc. Louisville is located, and another town will be laid out just below in a few days. The boys from Beartown began coming in to-day.

Another letter says: "The creek is 25 miles long, and they have found good prospects in every place thus far. I only saw two pans of dirt washed—87 cents to the two pans. Tipton got nine dollars and seventy-five cents to five pans; Jim Lawer, two dollars and seventy-eight cents to one pan, and the discoverers panned out over $300."

Nevada.

COPE DISTRICT.

Argenta.—Elko *Independent*, Dec. 25th: The vein at a depth of 77 feet is 18 feet in width, and carries the richest ore, Five tons came down on Thursday, and left for San Francisco yesterday.

Reinhart & Co. received, yesterday, a consignment of bullion from Cope. This is the second shipment from the Atchison & Drew mill.

Mountain City.—This mine, lately purchased by Meader & Co., is being worked vigorously, and the ore said to surpass in richness any before found.

HUMBOLDT.

Yosemite Mine.—*Register*, 25th; The owners are making arrangements to develop their property. The Supt. has arrived from California, and commenced operations with six men. The vein as far as developed averages two feet and the ore is of the richest quality—a lot shipped to San Francisco yielding $660 per ton.

Battle Mountain.—In the Buena Vista ledge, a tunnel of 275 feet cut the ledge at right angles at a depth of 120 feet. At the point of intersection the ledge is 10 feet wide and contains seven feet solid chloride and sulphuret ore, which assays from $40 to $250 per ton. The owners are having a shaft raised from the tunnel to the surface for ventilating purposes, and extensive ore houses built.

The owners of the Caledonian ledge have sold two-thirds interest to an English Co. for $20,000, The new owners are prosecuting work vigorously.

Excitement.—The people of Gold Run have been excited. An Indian brought into camp a piece of ore of exceeding richness which he claimed to have found in the mountain south. There was a general rush in the direction indicated. Meantime two or three individuals corralled the Indian and succeeded in spiriting him away on a fleet charger.

REESE RIVER.

Prospects of Austin.—*Reveille*, Dec. 23d: The ore in Lander Hill is rich. Last year the silver produced by the Manhattan mill amounted to about $1,200,000. Yesterday we heard of three miners who received $10,000 as their share of the profits of ore obtained from a mine in that hill by about one month's work. But these are not the cases upon which we base the future prosperity of Austin. Her resources are broader.

Bullion.—For the six days ending this date there were produced at the Manhattan mill 17,733 ounces of bullion.

Yankee Blade.—We hear several mines highly spoken of. Among them are the Tuolumne, the Chase, the Maggie, and the Yankee Blade mine of the American Co.

WHITE PINE.

Weekly Mining Review.—*Empire*, 25th: As a rule, mining matters have flourished for the past week. The men who were knocked off have found employment or gone to work on their own account, and there are not more idle men than formerly. The true solution of the question of the suspension of work by two or three of the leading mines on Treasure Hill will be found in the oversupply of ore on the dumps of the various mills.

The *News* says: "The new developments in the Earl, and the extraordinary showing of bullion value in the South Aurora, are encouraging. We hear of a break-off on one link of the chain of circumstances connected with the late stoppage. The corporations have come to a dead lock on a consolidation project, and the mining interest is likely to be gainer by it.

Bullion.—*News:* The bullion shipment for the week is—from Hamilton, $14,870.79; from Treasure City, $43,017.27. Total, $56,888.06. A considerable amount lies over for the beginning of the week.

The *Empire* reports: Our bullion shipments for the last six days amount to $61,327.91—nearly double the shipments of last week. In addition to the above, Wells, Fargo & Co. will send forward about $10,000 to-day. The base metal interest has not flagged. The shipments of the week will aggregate in the neighborhood of 30,000 pounds.

Items.—*Empire*, 25th: South Aurora West tunnel is in 120 feet, and is driven night and day. The main breast is 50 feet by 40 in good ore. Shipping over 100 tons to mill daily....Original Hidden Treasure works 40 men, and ships ore enough to the Swansea mill to keep it in constant operation. The north tunnel is also in good ore....Aurora Consolidated ships 20 tons daily. In the north drift of the Earl chamber, a winze is being sunk in good ore. From the south works a large amount of ore is being taken. Pulp assays for the week average $122 per ton....California commenced shipping ore to the Stanford mill on Thursday. The yield for the week is expected to be $20,000....Imperial shaft is down 50 feet in good ore....Truckee is working nine or ten men, and shipping the same number of tons to mill daily. The pay ore is six feet in width....Miner's Dream shaft down 40 feet. A large amount of good ore on dump, but no chance to get it milled....Eberhardt's active force reduced to 15 men on the mine, and shipping 10 tons of fair grade ore to the Oasis mill....Bullion main shaft down 30 feet, shows a fine body of mineral....Cadiz furnishes a large amount of smelting furnaces at $12 per ton....Clyde working a few men and shipping some good ore....Idlewild being worked, with an abundance of good ore in sight....Silver Wave attached for $2,000, and all operations suspended....Mazeppa sinking the main shaft with four men; looks well....Nellie Mac, small force at work and indications flattering. Silver bars are actually a drug at Bradshaw's assay office....The machinery of the Chandler quartz mill was yesterday on shipment to Silver Park.

Items.—*News*, 25th: Blackfoot, in Blue Hill, struck it Thursday. Rich ore, covered with horn silver, is common....Grant and Colfax mine has the largest body of ore we ever ran against.....The several claims of the Great Basin Co. are all in ledge matter....The Imperial is reported sold....Joe Potts ore milled last week $97 per ton. Work has stopped while the Co. consolidated with the Merced Co....Wabash has 100 tons ore on dump. The best is put at $200 per ton.

Outside Districts.—The *News* says a new district is started 30 miles this side of Ely. The rock assays $75, and lies in *fields*—so say "the boys." The *Empire* has two letters from Eureka District. We can only give an item or two. Five tons of Page & Corwin ore, Secret Cañon, worked $539 per ton at the Manhattan mill. An 18-foot shaft shows rich rock all the way. Spring Valley ores vary from $200 to $600 per ton. The Reeves & Berry ledge is 100 feet wide, but not so rich as some of the others.

Important Mining Sale.

We learn that the Union Hill quartz mine at Grass Valley and the Buckeye gravel claims at Birchville, have been sold to a company of English capitalists, known as the Pacific Mutual Mining Company, limited. The price paid is said to have been £150,000--nearly $750,000.

The London *Mining Journal*, Nov. 27th, gives the proceedings of a meeting of the Pacific Mining Co., and contains a lengthy report of George Batters, the agent, who visited this State, from which it appears that the North Star mine at Austin is included in the purchase. The amount paid for the three mines, as appears by the statement of a stockholder, was £135.000—the capital stock of the company being £150,000. The transfer was made the 23d ult. Mr. Batters spoke for over an hour and a half, giving a history of his investigations on the Pacific coast, and so satisfactory were his statements that the Pacific Mining Co. was formed immediately, and although the prospectus had not been issued, and no printed statement had been made, as is customary in London, the entire capital stock of the company (£150,000) was applied for twice over before four o'clock p. m. of that day.

Mr. A. B. Brady, of Grass Valley, acted as agent for the company in receiving the property.

San Francisco Mining Stock Market.

The Mining Stock Market has been very quiet during the past week, not much animation resulting from the Christmas feasts. It was not until Wednesday that any considerable activity was shown, resulting in improved figures for Crown Point and Yellow Jacket. The principal decline has been in Gould & Curry, which is $7.50 from last week; Overman declined $5. Yellow Jacket, on the other hand, advanced $8.50 in the same time. The following shows the difference between Friday the 24th and Thursday the 30th: Chollar Potosi, $19–19; Crown Point, $19—19; Gould & Curry, $77—69.50; Hale & Norcross, $152—150; Imperial, $52–53; Kentuck, $145—144; Mammoth $45.25–50c; Imperial, $52—53; Kentuck, $145—144; Mammoth, 45.25—50c; O. H. Treasure, $6—5.33¼; Overman, $80—75; Savage, $46.50—47; Yellow Jacket $45—53½.

The tenth annual meeting of the Gould & Curry Co. was held Dec. 27th. President Bull's report shows the advantages of the Truckee R. R., to which the Trustees had advanced $40,000. There has already been a marked reduction in the cost of wood and timber, from $15 to $11.50 per cord for wood. The railroad will permit the company to draw their supplies as needed. The Superintendent reports 15,879 tons of ore taken from the mine during the year, including 6,149 tons by contract. The ore worked by the company averaged $26.90 per ton, aggregating $247,516. The mine abounds with low grades of ore, which under reduced expenses can be worked at a profit. The main shaft has been completely repaired and lengthened 40 feet, making a total depth of 1,187 feet. Within 20 feet of the bottom of the shaft the seventh station has been opened, and drifts north and south made, the former being 160 and the latter 200 feet, with cross-cuts 50 and 57 feet respectively. The Secretary reports the receipts as $402,360 35; overdrawn and cash on hand, $22,930 .69. Total, $425,291.04. Disbursements, $425,291.04. Total assets, $322,392. Liabilities, $45,325.

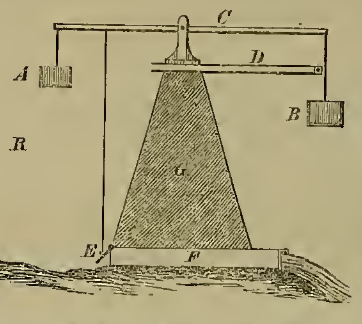
A Word About Hydraulic Mining.

In a communication in another column the writer refers to the wasteful way in which much of the precious metal is lost in mining, which, with a little more care, might be saved. This is a point to which more attention should be given. It is time now that we should recover from the first feverish excitement, which leads us to expect a too sudden accumulation of riches, and to husband more carefully our resources. As a country gets older, sudden fluctuations become more rare,—that is things settle down to a healthier condition,—and we are now getting well into advanced age, or at least beyond the rawness of extreme youth.

In hydraulic mining, many advances can still be made, although perhaps most miners are not inclined to think so. One advance of late is, for example, the improved joint for pipes, by which the stream of water can easily be turned in any direction. We need other such improvements and especially do we need such apparatus as will enable us to save more of the precious metal, which is now lost to so large an extent. It is better to obtain a certain amount which lasts for a long time, than to get a somewhat larger supply for a short period only.

We desire to hear more from our placer workings than we have of late. It is rather too difficult now to obtain correct information as to what is really being done.



We shall be very happy to receive from miners any communications with regard to work done, and will give such notice as such articles may deserve.

A gentleman this week has kindly given us a description of a simple self-acting apparatus for the storing and utilizing of water for sluicing claims where only small amounts are available. It consists in a self-acting hoisting gate, which renders the use of small reservoirs practicable, when situated at a considerable distance from the ground being worked. While there may be some incompleteness in so simple a contrivance as this, yet as we are informed that it is really doing good service in Trinity county, we give it as an apparatus which may be of use in many a case where circumstances forbid more complex machinery. The figure shows the cross-section of the bank or dam, and the apparatus mounted on a dam or embankment.

At two ends of a beam, C, which moves on a pivot over the embankment, G, (which dams up a gulch or ravine, into which flow small streams, and thus forms a reservoir, R,) are hung two boxes, A and B. A is filled with stone, B is for the present empty. The gate, E, of a sluice, P, is attached to the beam, C, by a chain or rope in such a way that as A is raised, the gate will be opened. When the reservoir is empty, E is closed, as the weight of A will cause it to drop, raising B in the air. The beam, C, is represented as level in the figure, merely for distinctness in showing the working of the apparatus. As the reservoir gradually becomes filled by the in-flowing streams, E being closed, the water flows over through the trough, D, into B. When this becomes full, the weight of A being properly proportioned, it lifts A in the air, and thus raises the gate, E. The water now rushes out with force through F to the required place, where it washes out the dirt and stones as the miner desires.

There is a small hole in the bottom of B, through which the water escapes gradually, and thus when the reservoir has become empty, B rises, and A falls, and the gate, E, is closed until the reservoir is again filled. The size of the hole in A is regulated according to the time required for the reservoir to be discharged through E.

A similar device to this was described in the Press over two years ago, without drawings. A miner in Downieville took the hint from our notice, and made a gate in a few hours' time, which saved him many times its cost during the season.

Notes on Contributions for our Cabinet.*

Nos. 450 to 453 were received from Mr. F. S. Maddox, and came from the Asbestus mining claims near Georgetown, El Dorado Co. Mr. M. gives the following description: The Asbestus is situated in the hornblende stratum or belt, between two thick ledges of soapstone (steatite), which are 100 feet apart in the middle and gradually approach each other at each end (north and south), forming a kind of elongated ellipse. Between the walls, at short intervals, are the auriferous veins of asbestus. The greenish rock [No. 453] is a vein-stone running through the gangue parallel to its wall.

No. 450.—Gold-bearing asbestus, as it is commonly called, These specimens, which are very beautiful, are apparently a sort of fibrous talc, which blackens in the flame as if still containing organic fibres. We have not had time to examine them carefully. Among the fibres are deposited scales of gold, some very large and beautiful.

A gentleman who called at the office and saw the specimens, reminded us, in this connection, of Dr. Wurtz's theory with regard to the formation of gold in quite large scales and corns. In gold veins, the upper part, where the pyrites, etc., have been decomposed, often shows these large grains, while below with the undecomposed pyrites, the gold, being minutely subdivided, is nowhere visible. The theory is that by the decomposition of the iron pyrites, persulphate of iron ($Fe^2 O_3, 3SO^3$) is formed. This, it is found, will dissolve the gold. If now the solution comes in contact with any organic substance, the gold will be deposited.

No. 451.—Foliated talc, light green.

No 452—Copper pyrites, of rounded form.

No. 453.—Serpentine, holding crystals of magnetic iron ore, together with one or two specimens of ilmenite or titanic iron.

No. 454.—Durango tin ore, from a lot now being worked at Taylor's Metallurgical Works. This ore is exceedingly rich, and the specimens are said to average some fifty per cent. of tin—which is very possible.

No. 455.—A piece of glass, the lower part of which, as the process of cooling was carried on gradually, has partly crystallized in globular masses, while the upper part is still massive and transparent. Presented by C. Newman, of the S. F. Glass Works.

---

* Under this heading we will continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., adds much to the value of such specimens.

* * *

Melting Points of Metals.—The melting points of several metals have been very carefully determined in a recent series of experiments by A. von Riemsdyk, of the Royal Mint at Utrecht. The results are as follows: Tin, 228.5° *centigrade;* bismuth, 268.3°; cadmium, 320°; lead, 326°; zinc, 420°; silver, 1040°; gold, 1240°; and copper, 1330°.

A New Haven firm makes billiard balls out of india rubber.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

Growing Nut Trees.

When it is desired to raise nut trees from the seed, the great secret of success is in never letting the kernel of the nut or acorn become wilted or dried; for as sure as it does, its vitality is lost, and no germination can take place. Many of our people, for the reason that nursery trees are scarce and high, are planting the nuts or seeds of various trees. Care should be taken, in selecting the nuts, that the above conditions have been fulfilled, or both money and labor will be lost, and, worst of all, discouragement will follow.

To prepare nuts properly for keeping or for transportation, they should be packed in boxes, or barrels, and carefully interlayed with moistened moss or some similar substance. The packing material should be just sufficiently moistened to prevent the nuts from becoming dry. Wheat chaff is a very good substitute for moss. The nuts should be packed immediately after being gathered. To keep up the moisture until the time arrives for transportation or planting, a good plan is to bury the box or barrel in which the nuts are packed in the ground, in some sheltered place, where excessive winter moisture can be avoided. In most localities in this State, for home-gathered nuts, they may be planted immediately after being gathered.

Chestnuts, oaks, hickories, etc., are difficult to transplant. They can be raised much cheaper and better from the seed. This is especially true of the black walnut, which has a long tap-root, which should never be broken. A good tree of this character cannot be produced by transplanting from the nursery without the utmost care. In fact, all nut-bearing trees are better raised by planting the seeds just where you wish the trees to grow. Two or more nuts should be put in a hill; and if all grow, prune out the weaker ones after the first year's growth.

Much attention is now being given, in all parts of the country, to the planting of such forest trees as are valuable for timber or nuts. We referred in our last issue, at considerable length, to the interest taken in the improvement of our native chestnut trees. An instance of improvement in this direction has since come to our notice, as recorded in the *American Agriculturist* for December, 1865, which figures and describes an American variety that has been so much improved in size by simply manuring the land about their roots that forty of them weighed a pound! Such chestnuts must come nearly or quite up to the famous Japanese chestnuts which were exhibited at the State Fair in Sacramento two years ago. It is also said that the nuts were greatly improved in quality by such culture.

The natural inclination of all forest trees is to throw out side branches as the trunk advances in perpendicular height. This habit may be encouraged by open cultivation; and should be where fruit is the main object in view. By planting close, the sun and air are excluded from the lower branches, so that they are smothered until they die out; thus encouraging a long butt, free from knots. The only access of the sun being to the tops of the trees, their growth is encouraged in that direction.

VARIETY IN CHESTNUTS.—In Europe, there are over *thirty* catalogued varieties of the chestnut, all of which may be had of the nurserymen. Great pains are taken there in the improvement of this tree, both by grafting and cultivation of the fruit, which, in many places, is largely used as food, and is very cheap. In the Atlantic States this fruit is worth from $7 to $13 per barrel. Its price in California is much higher.

Inverted Posts—Their Philosophy.

There is no question but that in setting fence posts, they should be placed in a position inverted to that in which they grew—or *top end down.* Numerous facts have been published sustaining the correctness of this theory in practice.

William A. Otis has informed the *Ohio Farmer* that he recently had occasion to take down a fence which he built twenty-four years ago. The posts were set butt end down—as they grew. These posts had all been reset, and the second lot were so much decayed as to be utterly worthless. Some gate posts in the line of the fence, which were set *top* end down, when removed, were in good condition, and fit for service for many years to come. The gate posts were thus set because, as they were cut off at the forks of the tree, the tops were the largest, and were, therefore, put in the ground to give the post a firmer "set."

Mr. S. E. Fiske, of Prairie Creek, Ind., some time since communicated to the New York Farmers' Club the fact of his once setting the two posts of a gate split from one log—one with the top end down, the other with the butt down; the latter was completely decayed in ten years, while the former was still good at the end of seventeen years.

Numerous other similar instances might be cited. We have one account before us of some posts set top down which lasted only about five years, and the party thinks he will never try it again. As he did not try any with the butt down, the experiment amounts to nothing. If any of the same lot had been set that way, we presume they would have decayed in two years. His timber was probably very poor, or the soil in which they were set particularly unfavorable for preserving wood.

Now if the results of inverting timber for posts are as we have supposed, and to some extent proven, there must be a cause therefor; and here we have it, and for aught we see, perfectly philosophical—furnished by a correspondent of the Germantown (Pa.) *Telegraph*, from whom we condense as follows: The particles of wood are so arranged by nature as to enable the water or sap of a tree to ascend. Were it not for this arrangement it would be impossible for the tree to grow. The making of a tree into posts does not change the arrangement of the particles, and consequently a post set in the ground in the position in which it grew, is constantly taking up moisture, while, by a change of position, the wood is drained of this moisture, and, as a consequence, the post placed in an inverted position will last the longest. If it is true that sap never descends, there may be considerable advantage secured by adopting his plan of post setting.

The correspondent of the *Telegraph* is in error in his supposition that sap never descends; but the circumstances and laws attendant upon the ascent of the sap and descent of the elaborated fluid in trees are quite dissimilar, as shown in the issue of the PRESS, of Nov. 13th, under the head of "The Flow of Sap in Trees." The laws of the movement of sap, as there set forth, fully warrant the conclusions given with regard to the cause of the greater durability of inverted fence posts. This is a subject of much importance to farmers everywhere, and should be generally known and acted upon. A knowledge of the philosophy of the practice will no doubt induce many to adopt it who would not do so otherwise, for fear of being laughed at for following what might be thought a mere whim.

A GOOD PARTY.—A "wood-sawing party" has been organized in Wapakonette, Ohio, numbering some twenty vigorous young men, for the practical purpose of sawing wood for all the widows of that town.

Mammoth Grape Vines.

Our readers are all familiar with the native habit of the grape vine to spread over a large surface; but probably the fact that it is also one of the longest lived of vegetable creations is not so well known. Californians are accustomed to point with wonder and pride at the great age and size of some of our mammoth redwoods. Other regions may point with equal pride at the great age and mammoth proportions of their grape vines.

Mr. J. A. Watson, in the *Gardener's Chronicle*, mentions a large vine growing on Mount Salevi, in Switzerland, which in March, 1867, measured three feet ten inches in circumference of the stem at four feet from the ground. The branches have covered and monopolized several large trees, and have had no pruning nor care of any kind for years; still the produce last year was four hundred bottles of first-rate red wine. This, at thirty cents a bottle, is $120 for the entire yield. Calculating the number of square yards covered by the vine, it is said to be at the rate of over $1,600 per acre. There is a vine in Richmond, Va., which measured forty-eight inches in circumference at the base, and sixteen inches in diameter, in 1865. There is a vine in New Jersey with a diameter of two feet. Downing mentions one on an island in the Ohio river which had a diameter of two feet, the branches of which covered more than an acre. These largest vines were estimated by Downing to be *two thousand years old.* There is a bearing vine in New Jersey which gave, twenty years ago, seventy-eight bushels of fruit, which went to market

It is in consideration of the great age and immense spread which the vine reaches, when left to its natural course, that has induced many persons to take the position that we cultivate it too closely in vineyards—that we thereby gorge it with unripe sap, producing an inferior fruit and inducing disease in the vines. It is well known that if we cut back the top of a tree, we, to an approximate extent, kill its out-lying roots, and thereby more or less injure their regular and healthy action. Such facts would at least seem to prove that the grape ought to have a large extension of both root and branch, to properly eliminate the fruit-forming sap. We have no knowledge of any experiment in this direction; but would suggest that such should be made. Take a small section of vineyard that has been in bearing, say six or eight years, and remove every other vine. Note for several years to come the quality and quantity on the section so thinned out, in comparison with an undisturbed area of equal extent. Vines so thinned should be allowed more stem, and should not be as closely pruned as is the common practice. The full advantages of such culture could not, of course, be seen until the lapse of several years.

A VINE NEAR THE DOOR.—The *Massachusetts Ploughman* well says that a traveler over a country road would instinctively have his eye caught and his thoughts somewhat tangled up by a fine vine growing vigorously near the door of a home. It does not matter how small or humble that home may be, it is raised in the esteem of the passer-by in holding up the suggestive shelter of a vine. It expresses love in the house, thoughtfulness for what is at once graceful and appropriate, pure and healthy domestic sentiment, and a spirit of contented happiness which many an one goes the world over to find, and looks for in vain. Such a simple home ornament as this is a token for all men to see, that the dwellers beneath the roof it adds expression to, are persons of feeling for what is true and lovely, for native refinement and quiet happiness. There should not be a farmhouse in the land without a vine somewhere contiguous.

THE cranberry crop of New Jersey for this year amounts in value to $2,500,000.

A Flower Garden on the Farm.

Why should not the farmer have a flower garden, as well as any other body? Don't he and his wife deserve some of the good and beautiful things of this life, as well as his neighbor in the village, who owns and cultivates that beautiful garden, which everybody admires? No time to attend to it; we don't believe it. He thinks, no doubt, that his *great* garden—his farm,—needs all his time and attention; but he is mistaken. He has a plenty of time, or at least he ought to have. He owes it to himself and to his family (all farmers have families) that he should maintain a garden—not one overrun with the curse of Adam, and covered with thorns and thistles; but one beautified with all the loveliness of the floral kingdom. There is many an odd hour that he can devote to its care and culture, until his sons and daughters are old enough to take the care off his hands. He should learn to *love* it himself, and teach his children to love it. It will add vastly to his own and the happiness of his family. Flowers are expressive of loveliness. Wherever you see a well provided flower garden, no matter how humble the house, depend upon it there is love and thrift in that house.

Horticulture occupies the same relative position to agriculture that the fine arts do to merchandising and manufacturing. The progress of either is an index to the advancement of a community in culture, intelligence and prosperity. There is this difference, however, in favor of the farmer—he can procure *his* refinements for less money than the merchant or manufacturer can; and his garden possesses more real value, and distributes more real happiness, than do the paintings and other adornments of his more pretentious neighbor. At the close of a prosperous career on the farm, what can give more real enjoyment to the farmer himself, or to his children, than the possession of a homestead adorned with flowers and trees? If his children have gone out from him to the city or elsewhere, how delightful they find it to visit the old homestead, made beautiful by the careful hands of themselves and their parents. How much such a home adds to the family tie. There should not be a farm-house in the land without its flowers and ornamental shrubbery and trees.

PEACH ORCHARDS IN CALIFORNIA.—The official county reports for the present year show an aggregate of 800,000 peach trees in California—enough to produce about 100 pounds of peaches to each individual in the State. The trees are distributed through the various counties as follows: Santa Clara county is down for 70,000 trees, Sacramento for 74,000, El Dorado for 56,000, Sonoma for 52,000, San Joaquin for 45,000, Butte for 40,000, and Napa, Placer, Tuolumne, Colusa, Amador, Yolo and Yuba range between 20,000 and 30,000 each, leaving about 250,000 for the balance of the State. The climate of California is well adapted to the cultivation of the peach, and it should be still more largely cultivated for drying. The average number of trees to the acre is about 100; and the average yield to a tree about 120 pounds of fruit, which, at four cents, the average wholesale price, makes the gross returns to the acre, $480, The entire expense for care and cultivation, aside from use of land and transportation, does not exceed $50.

HOW ROCK IS FORMED.—The soil, in most places, by its weight and the chemical solutions in the sub-soil, is constantly trying to form rock immediately below where it is disturbed by the plow-share. It is the business of the farmer to see that this process does not go on too near the roots of his plants. His plow and spade are the proper instruments of his warfare in this contest. Plow deep.

"It Broke Itself, Ma'am!"

Such was Bridget's reply to the query of a careful housewife who found a broken platter in the closet—and Bridget was not much out of the way, either, as we will show.

The body of common crockery ware is composed of a mixture of clay and silica (quartz). This mixture is moulded into shape and baked at a slow heat. In this condition it is porous, and will not hold liquids. To render it fit for use, clay, litharge, and ground quartz are mixed with water, forming a solution, into which the "baked" ware is dipped, and then submitted to another baking at a higher temperature. By this process the materials of the bath, which adhere to the surface of the dishes, are melted together so as to form a thin coating of glass all over the same, and impervious to moisture. This is called "glazing."

Now, if by careless handling, or by putting the dishes when very cold into hot water, this glazing becomes cracked, and water or fat may be gradually absorbed into the inner or porous portion of the dish, by which it is caused to swell and press against its coat of glazing. The glazing is unaffected by the fluid; but will expand by heat, and contract in cooling. If a cracked dish is suffered to remain a long time in hot water, the glazing will expand by the heat, and the interior by the absorption of water; then if the dish be taken from the water, wiped and put away upon a shelf, the glazing will shrink on cooling, while the interior will remain about the same—shrinking a little, but less than the exterior, and the consequence is, very likely, that a further sudden cracking of the glazing takes place, producing a shock which involves the entire dish, separating it into two pieces along the original line of fracture. Hence, Bridget was not far out of the way in saying "It broke itself." Bridget, however, must be careful about putting her crockery into hot water when it is very cold.

Cracked Dishes Unfit for Use.

There is another trouble often attendant upon badly-cracked dishes. As we have already shown, such dishes absorb oils or fats from the different kinds of food placed upon them. These fats soon become decomposed in the pores of the dish, and no amount of cleansing can remove the nauseating and poisonous deposit. Such dishes are filthy and unfit for use. The peculiarly unpleasant taste sometimes noticed in pie-crust is caused by their being baked upon old, cracked dishes, from which the rancid fat from previous bakings has been absorbed.

BIRDS PREFER TO FLY AGAINST THE WIND.—Careful observers have noticed that birds always appear to fly against the wind, and when aquatic birds dive, they prefer to do so against the stream. Migrating birds are always most numerous when the wind is blowing from the direction in which they are moving. If the wind blows strongly in the direction of their flight they frequently alight and await a change. Great numbers of quails annually cross the Mediterranean into Africa, and it has been noticed that they invariably start with a head wind. If the wind happens to veer around during their flight so as to blow nearly in a line with its direction, these birds perish by thousands in the water. The general opinion is to the contrary of the above, but observation has fully proven it correct. Reason: When the wind is *with* the bird in its flight, it gets under and ruffles its feathers in such an aggravating manner as to destroy its equilibrium, and possibly its equanimity at the same time. The result is a desire or a necessity for alighting. The same trouble would, of course, hold good with the swimming or diving of an aquatic bird.

Profits of Wheat Farming.

Under the head of "Profits of Farming in Stanislaus," we copied, two weeks since, an unconsidered article from the Tuolumne City *News*, in which that paper claimed that wheat could be cultivated in the San Joaquin valley at a cost of $4.80 per acre. The Contra Costa *Gazette* very properly thinks the figures given by the *News* are altogether to low for any locality, and says:

"There is undoubtedly a great deal of light land in the San Joaquin valley that will produce wheat in favorable seasons at small cost; but taking the wheat lands of the State together, and allowing $2 per acre, for rent or interest, which is not above a fair rate on the valuation, the cost of producing grain crops will not be found less than $10.50 per acre, without including the cost per bushel for thrashing, which, at the average of twenty bushels per acre, would be $1.80, and sacking, $1, making a total cost per acre, of the sacked wheat, in the field, $13.30 for 1,200 pounds. The further cost of hauling, freight, storage, etc., will depend upon the situation, distance and other circumstances, but will not average less than $3.30, making the whole cost of producing and marketing twenty bushels, $16,60, or a rate of eighty-three cents per bushel, which, at present prices for average quality of wheat, leaves so exceedingly small a margin of profit, as to furnish but little encouragement to immigrant farmers, if exclusive wheat growing is to be their sole resource."

The figures of the *Gazette* are full high enough, but are no doubt very close to the truth. The average per acre is smaller than it should be. With proper cultivation, and very little extra cost, the California yield of wheat might be increased fully 50 per cent., which ought to more than double the present average profit per acre.

The Pea Weevil.

The pea is very liable to attack from a species of weevil, commonly known as the pea-bug. This insect deposits its eggs in the pod just as the pea is swelling. The mischief is done at night or in cloudy weather. As soon as it is hatched, the grub makes its way into the young pea, and remains there till toward the close of the next winter, when it leaves its abode, after having changed into a pupa and cast its skin. A smooth round hole gives evidence of its long sojourn. Generally, if not always, this insect leaves the germ uninjured, so that seed affected by it will germ, though of course the grain is diminished in value by its depredations. There seems no effectual way of preventing the attacks of this insect. Some recommend very early sowing, and others very late sowing, but this troublesome little creature lives in other plants, so that its destruction is well nigh an impossibility. Professor Dawson is an advocate of early sowing, and remarks that it is worthy of inquiry whether, by sowing betimes, peas may not be harvested soon enough in the season to take a crop of buckwheat from the same ground. If this is not practicable, a sowing of buckwheat might follow peas, and be plowed in to enrich the soil for a crop of something else the following year.

TO MAKE CUTTINGS GROW.—Cuttings which are difficult to grow in other ways may be made to grow readily by putting both ends in the ground and allowing the plant to start from a single bud in the center. It is said that cuttings of the rose, apple, pear, plum, etc., may be readily made to grow in this way. The cuttings should, of course, be kept well moistened, and should be the growth of the previous year. By this method they draw nutriment from both ends, instead of exposing one end to be dried up in the atmosphere.

A CHEAP WAY TO CLEAN BROOM CORN SEED.—I. Mather, of New Jersey, recommends standing the corn with the heads through the palings of the poultry yard, when the seed will be taken off "free of cost." That is making the hens earn their own living, besides furnishing eggs.

Flowers in a Vase.

Of all the various mistakes that are made by persons in arranging flowers, the commonest is that of putting too many into a vase; and next to that is the mistake of putting too great a variety of colors into one| bouquet. Every flower in a group should be clearly distinguishable and determinable, without pulling the nosegay to pieces; the calyx of a clove pink should never be hid by being plunged into the head of a white phlox, however well the two colors may look together. Sweet peas never look so well in the hand as they do on the boughs over which they climb, because they cannot be carried without crowding them; but put them lightly into a vase with an equal number of pieces of mignonette, or rather ornament a vase of mignonette with a few blooms of sweet peas, and you get a charming effect, because you follow the natural arrangement by avoiding crowding of the blooms, and putting them with the green foliage which they want, to set them off. Few people are aware, until they try it, how exceedingly easy it is to spoil such a pleasing combination as this; a piece of calceolaria, scarlet geranium, or blue salvia would ruin it effectually. Such decided colors as these require to be grouped in another vase, and should never be placed on the same table with the sweet peas; they also require a much larger preponderance of foliage to set them off to advantage than is wanted by flowers of more delicate colors. It is unquestionably difficult to resist the temptation of "just putting in" this or that flower, because it is such a beauty; a beauty it may be, and so may be an apricot, but it would be out of place in a basin of green pea soup! There is at least one proper place for every flower; and let every flower be in its place.—*Gardener's Chronicle.*

How the Seed Contains the Tree.

In the single-flowering cherry tree, which gives the most distinct illustration of this fact, the pistil is formed from two capillary leaves, which have become succulent and united together so far as to form a component pistil with a simple cavity containing the young seed. Reflecting on this, in connection with the nature of buds and leaves, and minute examination of the germ bearing the plumule and radical of a bean, it appeared clear that a germ of vegetable life exists in every joint of a plant. To try this, a joint of mint appeared the best experiment. This was placed in water, having been cut as close as consistent with leaving the joint uninjured at the lower end. A bud soon appeared on one side, which quickly formed itself into another joint, from which a root grew out, whilst the original bud continued to progress, and seemed disposed to show the characters of a monocotyledonous germination, (having only one seed lobe or seminal leaf) assuming a green tinge at the extremity. However, a second joint and another root was thrown out from it. A decided upward growth now continued, and buds and leaves were formed at all the joints subsequently developed. This would prove that a joint in a plant is a life-knot, from which, under favorable circumstances, a plant or tree may be developed should it be separated from its original stem, and that it corresponds with the radical plate of a bulb, the crown of plants, the germs from which the plumule and radical are developed in seeds.

GROWTH OF OUR BIG TREES.—In the December number of the *Gardener's Monthly*, Philadelphia, Pennsylvania, P. Barry gives the present size of some seedlings from our California big trees. Those in Lamory Park, Kent, England, planted in 1854, and consequently now fifteen years old, are twenty-nine feet ten inches high, nineteen feet in diameter across the branches, and six feet nine inches in circumference of trunk one foot above the ground. Those planted in the same park two years later are twenty-five feet two inches high, fourteen feet eight inches across the branches, and five feet three inches in circumference of trunk. Those planted in Ellwanger & Barry's nursery grounds at Rochester, New York, in 1857, in a group without sufficient room to spread, are now, at the age of twelve years, twenty-four feet high, eleven feet across the branches, and three feet nine inches in circumference of trunk. These facts show a rapidly growing tree, and the people of this State, its own habitat, should look to it as one of the sources of our future supply of lumber.

Pickled Forage.

The Germans are great on "sauer-kraut." They even prepare a variety of this condiment for their cattle. It is done in this wise: Several pits are dug in a clover field, about ten feet deep, with the same width and length; these are lined with loose boards, and the clover thrown in green, as cut, and thoroughly trampled down by two men; the surface of every layer, about a foot or eighteen inches in thickness, is whitened with salt; layer is added to layer, and trampled as above and salted, until the pit is filled with a comparatively solid mass of clover. A rude covering of boards is then put over the whole, sufficient to turn rain, a slight trench, such as a soldier digs around his tent—and the operation is then complete. After fermentation, the mass is cut out through the winter with sharp spades, fed to stock of all kinds, and devoured with great relish. The same process is applied to pea vines, the leaves of the Jerusalem artichoke *(solamin tuberosis)* and to the leaves of certain forest trees. When we consider the difficulty of curing for winter's use, all the more succulent varieties of herbage, and the immense annual loss of that most valuable of all forage plants, clover, in the curing, it is to be hoped that some one will have the nerve to give a fair trial to this Prussian process. The Germans are eagerly imitated in the use of the needle gun and in the art of destroying; why not in that of sustaining life?—*Ex.*

GOD SEEN IN THE FLOWER.—The argument for the existence and wisdom of God, drawn from the marks of design in the works of creation, is one which cannot be controverted. And it meets us at every step. In the flowering month of June, the gardener may discover so beautiful an illustration of divine wisdom, that we must call special attention to it. It is in the habits of the plant known as *Colchicum.* It blooms in October, sending up from the damp soil its flower-stems without leaves, and then disappears. Flowering thus just upon the verge of winter, it has not time to perfect its seed and so provide for its own reproduction. But the unmatured seed lies protected in the bulb below ground through the winter; then, in the spring, up shoots a fruit-stalk, on which the seeds mature and ripen about the first of June. What an admirable provision! Does this happen by chance?

TIMBER MADE FIRE-PROOF.—Professor Reinsch has come to the conclusion that common salt answers the purpose as well as anything. Timber impregnated with a concentrated solution of salt, will not burst into a flame, any more than if coated with silicate of soda. The salt is also a preservative against dry rot and noxious insects.

TO TRY OUT LARD.—A mode of trying out leaf-lard, one which produces few scraps, is to add to every ten pounds of rough lard a tablespoonful of saleratus during the process of trying out.

Notices to Correspondents.

SUBSCRIBER, San José.—You can bring water from a well even more than 121 feet from your house, by placing a common pump in your kitchen, provided your well is not more than 25 or 28 feet deep. In order to do so it will be necessary that your pipes should be perfectly tight. Lead pipe would not be safe for use, as the water would have to stand in it so long that it might decompose the metal to an extent which would render the water poisonous. Gas pipe will answer your purpose; and by the use of the joints and corner pieces which come with it, you can easily vary its direction as desired. You can put in gas pipe as readily as lead pipe, and it is cheaper. A pump in a house is a very convenient hing. No housewife should ever bo compelled to go outside to draw water for the family.

PLOWMAN, Contra Costa.—It is diffcult to draw a precise line between a regular farmer or gardener and an amateur farmer. An amateur is usually regarded as one who is versed in, or who is a lover of, some particular pursuit; but who is not engaged in it professionally, or does not get a living by it. As the individual to whom you refer derives a part of his income from market gardening, we should not call him an amateur.

PRO AND CON, Ellsworth, Nye county, Nev. Much obliged for your communication, but as we have been overwhelmed with articles on the same subject, we are obliged to refrain from publishing it.

FIRE HOSE.—The contract for supplying the Fire Department with 5,000 feet of hose, by Mr. M. Cook & Son, was completed on Saturday, the 18th inst. The test of 180 lbs. to tho square inch was applied to it by the Department at the corner of Powell and Ellis streets. Twenty-four hundred feet were tried, and without a single exception stood the ordeal. It was accepted by the officers of the Department and taken to the corporation yard.

◆

"MELTED"—NOT "WET."—In the communication of Mr. Pique, on the second page of our last issue, the term "wet" was employed where "melted" was intended by the writer, in speaking of the conducting properties of glass and resin. The mistake arose from indistinct manuscript.

◆

VALLEJO has increased during the past two years at the rate of 25 per cent. per annum. The present population of the town is about 8,000.

A New Volume and a New Year.

As the beginning of a new year also marks the commencement of a new volume, it seems peculiarly appropriate that we should hold a little familiar talk with our readers and friends on matters pertinent to their own interest and to ours.

We enter upon the eighth year of editorial duty, conscious of many past defects and short-comings, when judged by the standard of excellence set up by a discriminating public in measuring their expectations of what a periodical, such as we have aimed at, should be made. Still we confess a feeling of honest pride at what has already been accomplished, and with enlarged experience, more effective assistance and increased facilities, we hope to render the paper still more useful than ever to its readers, and more worthy to be held up to its readers as the representative journal of the material interests of the Pacific coast.

With the commencement of the twentieth volume the publishers have gone back to the original name under which the paper was established. In dropping the prefix of "Mining," it is not our intention to make any change whatever in the character of the paper, other than to do our utmost to improve it in whatever manner may be in our power. We have made tho change for the sake of brevity, and because the title of the paper as it now stands more nearly expresses its true object and mission—to elevate and develop the three great industrial interests of this coast—Mining, Farming and the Mechanic Arts. These are the practical sciences with which we all have more or less to do, and it will be our aim to discuss them in a plain and practical manner.

We and our circle of readers form a company of students in the great college of Nature, our business being both to teach and to learn. We invite all earnest inquirers after facts and principles connected with the pursuits mentioned, to set down with us and employ the "SCIENTIFIC PRESS" as their medium of intercommunication, their vehicle for receiving and imparting instruction. It falls to our lot to be the *leader*, simply, in this great school of enquiry and research—not the teacher. We have set up for no such position. We have simply started a great, comprehensive, coöperative school, in which we invite all who place any value upon knowledge to join us. We are all inquirers after facts and principles connected with Mining, Farming and Mechanics. We therefore invite all engaged in those pursuits to supply us with information and suggestions that may be of general advantage. It will be *our* part to collect and arrange the same so that the public may most readily take advantage of it.

By our position we are placed in communication with co-laborers in all other parts of the world, who are daily sending to our address, in the various journals with which they are connected, the results of their obsevation and experience. Much of such information comes to us in a crude condition, or unsuited to our particular locality. Especially is this true of agriculture and mining. In the former, our variable circumstances of climàte, soil and labor; and in the latter, our geological and topographical, social and physical conditions, are so different from such conditions elsewhere, that it is only by careful deductions from our own experience that we can hope to improve our own practice by comparing it with that of other localities. We can have a really living, growing and improving system of agriculture and mining here only by the intelligent collection and comparison of the results of our own experiments, founded upon a most judicious use of the knowledge of what is being done in these pursuits in other parts of the ready done—and we have abundant evidence that they are—will they not aid us at this favorable opportunity in extending the area of that usefulness. We have no hesitancy in making this request, for we are conscious that we have endeavored to return value for value; and that our efforts to promote the best interests of the Miner, the Farmer and the Artisan, have been earnest and successful, and not altogether without recognition in quarters from whence we may well feel pleased at such appreciation.

We intend to make the SCIENTIFIC PRESS a *live paper*—one from which may be derived both pleasure and profit—and with this pledge we again renew our promise to keep pace with the march of the times.

◆

Disasters in Pennsylvania.

The particulars of the explosion at the torpedo factory at Titusville, December 16th, and of the caving in of the coal mine at Stockton, December 18th, have been received. In the first case, only one life was lost, but one or two buildings in the neighborhood were badly damaged, and in Titusville—the factory was situated about a mile from the city post-office—houses were shaken, windows shattered, and considerable injury done generally. The cause of the explosion is unknown. The supposed amount of explosives destroyed is stated as 1,500 pounds of gunpowder and 3,000 to 4,000 pounds of nitro-glycerine. A most remarkable fact (if it is a fact) is, that some 1,500 to 2,000 pounds of nitro-glycerine were thrown out of a building, which was demolished, to quite a distance, without exploding. The glycerine was packed in cans, which were placed in wooden boxes, and surrounded with plaster of paris, the cover being fastened with screws to avoid hammering.

At Stockton, by the caving in of a stope in Linderman & Skeer's coal mine, at five o'clock in the morning, two double houses were engulphed with enormous masses of earth. With the houses, ten persons were carried down, and, as the stoves in the buildings set fire to the wood-work, there could be no hope of any one surviving in the burning mass. There is great excitement, and the fear that other houses will fall or the mines take fire. If these little things do happen, very likely more precautions will be used thereafter in that place.

◆

In Memoriam.

DR. PEREZ SNELL, a gentleman well known throughout the central portion of the State, died at his residence in Sonora on Monday last. Dr. Snell was a native of Vermont; served in the war of 1812; acted as Professor in the New Orleans Medical College for several years; came to Sonora, in this State, in 1850, where he has ever since resided, devoting his time chiefly to scientific pursuits and the collection of a cabinet of California curiosities and geological specimens, which is now one of the most extensive and valuable in the State. He died at the advanced age of 87 years.

MR. WILLIAM G. HESLEP, one of the early pioneers of California, died in Arizona on the 6th ultimo. Mr. Heslep had recently gone to that Territory to assist in developing its mineral resources. The Arizona *Miner*, in speaking of his decease, says: "Although he had sojourned with us but a short time, his genial disposition and sound practical sense, added to great knowledge of mines and mining, won for him the esteem of our people, who had commenced to look upon him as the savior of this section of the Territory, for the reason that he alone, of all those who had come here to work quartz, had achieved success, and was prepared to prove to all doubters that, in point of richness, the mines of this vicinity were second to none on the continent. All had faith in him, for his record, which came before him was good."

The Earthquakes.

The earth seems to be getting uneasy and to show symptoms of being about to do something. But as yet, no very severe convulsions have occurred, and no great damage has been done.

On December 26th, at about six o'clock in the afternoon, a series of shocks occurred, extending north and south in this State from Marysville to Stockton, and west and east from Sacramento to beyond Reno, on the Pacific Railroad. The severest shocks were felt at the east at Virginia City and vicinity, walls and chimneys being thrown down, while at the west, no other damage was done than to shake doors and windows and cause chandeliers to vibrate.

About two o'clock next morning, another shock was felt in different places, and was apparently more severe at Sacramento than the first. Other slight shocks have since been reported.

The vibrations of the first shock are recorded at Stockton as from northwest to southeast; at Sacramento, south to north; at Truckee, east to west; at Reno, southeast to northwest, and at Virginia City, north and south. Judging from the times recorded, it might be thought that the quake came from the east to the west. The data given as yet, however, are not accurate and full enough to enable us to determine with certainty the central point, nor the exact directions, etc. It is to be hoped that accurate observations will be made in any case, on which may be based deductions, which are very important and interesting. Of course, until the country is more fully settled, the data must be incomplete; but we might, as it is, have much more information than we do.

This year, it would seem as if it was thundering everywhere. In the eastern part of the Union, here and there it has been asserted that small shocks have occurred. In Europe, quite severe shocks have been felt. In various parts of Germany, it is said, chimneys have been thrown down and plastering cracked, and this in the interior of the continent. At Naples, observers say that Vesuvius is big with menace, and it would seem that other volcanoes are beginning to rouse themselves after their long rest. And Africa also is joining in the dance—Algeria having been severely visited.

◆

Death of Edwin M. Stanton.

This week brings us the news of tho death of one who has, of late years, borne an important part in the history of our country. On the 24th inst., Edwin M. Stanton, Secretary of War during the late strife, succumbed to disease, contracted by his severe labors, and died of congestion of the heart.

The deceased was born at Steubenville, Ohio, in 1815; passed a year at Kenyon College; studied law, and was admitted to the bar at the age of 21; was called into the cabinet by President Buchanan, as Attorney General in 1860, and appointed Secretary of War by Lincoln in 1862.

Only a few days ago, Stanton was nominated as a Judge of the Supreme Court, and confirmed by the Senate, but did not live to receive his commission. As a mark of respect to his memory, this has been sent to his widow, with the signature of President Grant.

◆

SHARP PRACTICE.—According to the New York *Evening Post*, a company, which has been at work for some months on a supposed pneumatic dispatch tube under Broadway, is really building a tunnel for an underground railway. The utmost secrecy is maintained with regard to the work, no one being permitted to go down the shaft to the entrance of the tunnel; even the city authorities are ignorant of its size and direction. The object is to push the work so far that the Legislature will feel compelled to grant a charter.

Reduction of Price and Other Improvements.

With the beginning of the New Year, and in consideration of the altered condition of things on the Pacific coast, whereby it becomes necessary for people here to curtail their expenses, and economize their means, we have reduced the price of the Scientific Press from five to *four dollars* per year. We have also done this in the expectation that it will bring large accessions to our list, and operate as an increased inducement for the continuance of many who may have been thinking of curtailing their expenses by discontinuing the paper. Notwithstanding this reduction of price, we would assure our readers that we shall still continue to add to the interest and value of the paper by improvements in its appearance, and in the matter which it may contain.

During the past few months we have taken what we are assured by others is an important step forward, in adding to the amount of our agricultural matter, and raising it to a special department in the paper. This has not been done at the sacrifice of any other class of reading, but by giving an increased amount of the same. The increased attention which is being paid to this branch of industry in the mines, and its rapidly increasing importance in the valleys, to say nothing of the advice of numerous friends and subscribers, fully warrant this step; and we are pleased at the various expression of satisfaction thereat which have reached us from all parts of the coast.

During the coming year we shall also devote increased attention to our Mechanical, Mining and Patent Departments, and to the illustration of such new devices and machines as may be introduced from the improvement and advancement of these important branches of industry. If our friends are satisfied with what we have al world. California—or, rather, the Pacific coast—requires a practice, system and school of its own. The theories and practices of other countries must be modified here to suit our own peculiarities as actual experiments and results shall point out.

It is the province of the Scientific Press to collect this information, both at home and abroad, and to spread it before the public for the benefit of all. It is such facts as those above set forth that render this paper more valuable to people on this coast than any class journals from abroad. Thanking our friends for their assistance in the past, we would invoke a continuance of their coöperation in the future, to the end that they may unite in adding the benefit of their knowledge and experience to the common stock.

* * *

The Aerial Steam Navigation Company.—At a meeting of stockholders of this company, December 17th, 1869, Messrs. Eugene Sullivan, Thomas N. Cazneau, Henry F. Williams and Simon L. Jones were appointed a committee to receive subscriptions for one thousand shares (one-tenth of the capital stock of the company) at the rate of ten dollars per share of the par value of one hundred dollars, said shares to be *unassessable*. The funds thus raised are to be devoted exclusively to the construction of the first aerial steam carriage, and to be deposited in the Bank of British Columbia, to be disbursed upon requisition of Mr. George K. Gluyas, Engineer of Construction. The working, drawings, etc., can be seen at the office of Gen. Thomas N. Cazneau, No. 321 California street, where subscriptions will be received. No invention for navigating the air has before received such positive indorsement from engineers of reputation, or so liberal encouragement from prominent capitalists as Marriott's Avitor, which now seems sure of being thoroughly tested on a large scale.

The Ramie.

It would seem as if we were to have another excitement in our State with regard to this, to us, new, plant. Such favorable reports have come from other parts of the Union, where its cultivation has been tried, that it is thought many farmers here will give their attention to its propagation.

History of its Introduction Into the United States.

The plant, although quite new in this country, has long been known in other lands. Under the name of the China grass, large amounts have been imported into Europe. The technical name is the *Boehmeria tenacissima* for the Javanese, and the *B. Nivea* for the Chinese variety. The former is the one cultivated in the Southern States.

The late wars in China and Japan have caused the yield in those countries to become irregular, and inadequate to supply the demand; and it is owing to this that the plant has been introduced into the United States. In 1867, Dr. Benito Roezl was successful in cultivating it in Louisiana, and from here its cultivation has spread into most of the other Southern States. This year an effort has been made to introduce it into California, and it is thought that the soil and climate are such that the plant will produce immense crops at a small expense.

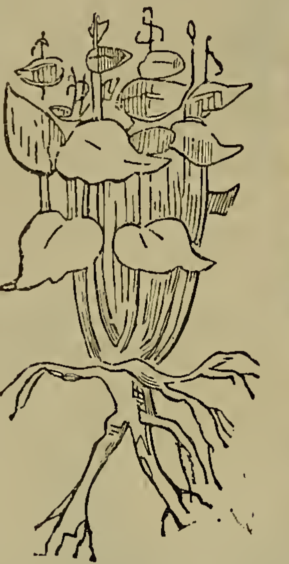

Fig. 2.—Ready for Propagation.

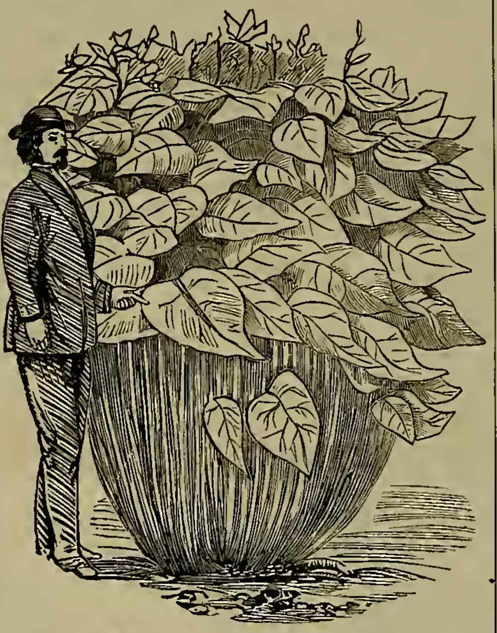

Fig. 3.—Full-grown Plant.

Requisite Soil.

A rich, sandy soil is the most suitable, especially for a nursery, where plants are to be propagated. The land should be thoroughly broken up and pulverized to a depth of ten to twelve inches. The plant is said to resist drought better than most others. It is claimed that the submerged fresh water islands of the Sacramento and San Joaquin, when reclaimed, are excellently adapted for the cultivation of the ramie, and will produce some 4,000 pounds of raw fiber to the acre yearly.

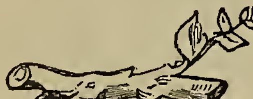

Fig. 1.—Root-Cutting.

Propagation in a Nursery.

The ramie is a perennial plant and a very rapid grower. It produces no generative seed, and can be propagated only from roots and layers, from which it can be rapidly multiplied. Fig. 1 represents a root-cutting for first planting.

In propagation, level cultivation is preferable; root-cuttings should be taken for first planting. These roots should be planted six feet apart each way, and three inches deep, in a slanting position, with one inch left above ground. The ground should at first be kept moist. No further attention is necessary, except weeding, until the plants are about two feet high, when they should be gradually and gently bent towards the ground. When three or four feet high, the plants grow brownish near the root, and are ready for propagation. Fig. 2 represents the plant at this period.

Incisions should now be made at each eye of the stem, which is bent down and covered with earth, a few top leaves being left above ground. In four or five weeks these layers will be rooted, and can be cut from the parent plant, divided into pieces and replanted.

Planting in the Field.

The ground, after being plowed as deeply as possible, is generally laid off in beds four feet wide, running the whole length of the field, with pathways three feet on each side, and, at intervals, cartways for harvesting.

The plant, after cutting, will rapidly shoot out other stems and yields three harvests yearly—there being two and a half months between the cuttings. Figure 3 shows the plant six months old; the figure of the man shows the relative height of the stems.

Preparing the Fibre.

The stalk is first soaked in water for a few hours, then passed through a brake, similar to a hemp brake, to divest it from the woody portion. It is again soaked and again passed through the brake, freeing it partially from the gum. A third soaking is necessary to remove all the gum, and then, after a third passage through the brake, it is ready for the refining.

The planter does up the fibre in hanks for the market. It is worth 10 cents, gold, per pound, as raw fibre. Preparing it for the factory is a separate industry, requiring bleaching and several manipulations.

Uses of the Fibre.

The prepared fibre is very soft and strong, and is used in what are called stuff goods, now much worn by ladies, as a substitute for silk. It is largely interwoven with silk itself, as in Japan and India, forming very desirable dress goods. It works equally well with silk and with worsted chain, takes fast colors, and always has a silky lustre.

Messrs. H. Hughes and J. S. Silver, 302 Battery street, San Francisco, say that they are authorized by English dealers to buy all the Ramie fibre which can be produced in the State for some years to come. They have, also, roots for sale, and machines for preparing the fibre for market. The English manufacturers prefer to buy the raw fibre and refine it themselves, rather than to take that which is already refined, as the latter, they say, is not treated as well here as in England.

If in the next few years, large amounts of the Ramie fibre are produced in California, it will but answer the expectations of many who have been watching the development of the plant. It would seem as if its cultivation would be most profitable, as it it is very hardy, requires but little attention, has no enemies, and is not affected by mildew, if reports are true. While we should be very glad to see anything undertaken which promises so well for the prosperity of the State, yet we cannot refrain, in view of the too great precipitancy with which Californians are apt to go into a promising business, from expressing the hope that the cultivation of this plant may not be overdone.

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

For the Week Ending December 21st.

Animal Trap.—Adam Brown, Bridgeport, Oregon.

Machine for Upsetting Tire.—Albert S. Hart, San Francisco.

Railway Car Coupling.—Albert S. Hart, San Francisco.

Variable Cut-Off for Steam Engines. Michael C. Taylor, Grass Valley, Cal. Antedated December 17, 1869.

Lubricating Sleeve.—George A. Lloyd, San Francisco, Cal., assignor to himself and Anthony Rosenfield.

Dynamometers.—John W. Sutton, Portland, Oregon.

* * *

Notices of Recent Patents.

Among the interesting and important patents recently issued to Pacific coast inventors, the following are worthy of mention:

Railway Car Coupling.—Albert S. Hart, S. F.—This is an ingenious self-coupler, which is so arranged that the coupling pin will be held in a position from which it will drop through the link as soon as the latter is inserted. It consists of a plate fastened horizontally to the upper side of the opening in the head or bunter, and having a hole through it in a line with the holes above and below, through which the pin can pass. Two sliding plates move forward and backward over this first plate, one above and one below; the upper one being pierced, so that when moved backward, it will allow the pin to pass through it, while the lower plate overhangs far enough to intercept the pin. A fourth plate is hinged to the first one, so that it stands at an angle, the lower end being weighted and resting near the back part of the chamber in the head. Now, by the introduction of the link, this plate is raised until nearly parallel with the others; at the same time, by means of a connecting-arm, the lower sliding-plate is moved forward so as to allow the pin to drop through the link and couple the cars. By the use of a coupling like this, all danger of crushing a person, who may be in the act of coupling, is avoided. But there is another point gained by this invention. The pin may be withdrawn before the cars are separated, and yet be left in a position to couple again without further handling, as in this case the upper sliding-plate will be moved forward by a spring independent of the lower one, and the pin can be left resting on this upper plate.

Variable Cut-Off for Steam Engines. M. C. Taylor, Grass Valley, Cal.—This is an improved device, by which the steam is cut off after the piston has accomplished a portion of its stroke. This is effected by two cams, which act upon the valve-stem more or less directly, one of which opens the valve, and the other, following it, moves it still further and closes the steam-port, but leaves the exhaust-port slightly open. The last, or cut-off cam, is attached to a cylinder having spiral grooves on the inside. A follower or plunger, having projections which fit these grooves, is moved backward or forward by a hand-wheel and screw, and makes the distance between the cams greater or less. By this, the point at which steam can be cut off, can be changed or regulated with the greatest ease.

* * *

The Spanish Gunboats.—These thirty vessels, of which so much has been said during the last few weeks, are all built, says the *Scientific American*, after one design, prepared by Capt. Ericsson. They are twin screw steamers, 105 feet in length, 22 feet beam, and their depth of hold is eight feet. Their maximum draft is five feet. The screw is five feet ten inches in diameter, and are each driven by two steam cylinders, the length of stroke being fourteen inches, and the diameter of the pistons fifteen inches.

The arrangement of the steam machinery is most compact; the whole, including pumps, surface condenser, fresh water generator, etc., resting on a surface of ten feet square and rising from this surface only six feet. The nominal horse-power of the engines in each boat is 140.

[From the Scientific American, June 12, 1869.]

Coal Tar and Its Products as Preservatives for Wood.

Ever since the establishment of gas works it has been considered a matter of great importance to find some useful application for their waste products, principally the coal tar. The old custom was to use wood tar as a coat for common wood structures exposed to the inclemency of the weather, and it was soon found that coal tar resinfies, dries, and hardens quicker than wood tar. This circumstance led to experiments to ascertain the preservative nature of coal tar.

More than fifty years ago, W. H. Hyett and others impregnated wood with gas tar, and reported that such wood, placed in a damp cellar, became moldy sooner than the same wood in its natural state, and that it showed fungi, particularly where the tar abounded.

In 1830, Reichenbach published his experiments, by which he obtained creosote from beechwood tar. He subjected the tar to a fractional distillation, the heavier products, which distilled over by increased heat, were washed with an alkali, redistilled, again treated with lye, and then with sulphuric acid, and again distilled. The substance so obtained he found to preserve meat, and therefore called it "creosote," meaning meat preserver.

This invention of Reichenbach served as a nucleus for a number of erroneous conclusions. It was alleged that a substance which preserves meat also preserves wood, which is not true. A solution of common salt, for instance, serves to preserve meat and fish, while it accelerates the decay of wood. It was said that coal tar is the same as wood tar, and furnishes creosote; but the truth is, coal tar differs materially from wood tar, and contains no creosote. It was further stated, that the mere distillation of coal tar is sufficient to convert the same or part of it into creosote, and the coal tar, which distilled over by increased heat, and was found heavier than water, was deceptively called "creosote," sold as creosote, and used as creosote to "creosotize" wood and preserve it, yielding, through such misrepresentations, large revenues to the gas works and inventors of various processes to impregnate wood with gas tar or its products.

The first man whom we find engaged in the creosotizing patent business, and probably the most candid inventor, was Franz Moll, in A. D. 1835. He found, by practical experiments, that the so-called "creosote of coal tar" was worthless to protect wood from decay. He ascribed its failure to the presence of other substances therein, with which the "pure creosote" is associated, and strongly recommends its previous purification with alkaline lye, similar to Reichenbach's process described above. When coal tar is heated in a still by gradually increasing heat, the product first obtained, which is lighter than water, is called by him "eupion;" the heavier liquid obtained thereafter he calls "creosote." Merely coating wood or timber with coal tar or other tar, he finds of but little advantage.

Moll's British patent was granted in 1836, and is the more interesting, as his process is based on the best principle, so far known, to saturate wood with liquids, and as his specification accounts for the necessity of tedious operations, without which he finds the application of the products of gas tar of no practical advantage. His process is as follows: The wood is placed in a close chamber, which is connected with one or more stills. He begins the operation by heating the inside of the chamber by a steam pipe or elsewise, to about 100° Fah., and then increases the heat gradually till sufficiently warm, to assist in maintaining the vapors of eupion and creosote in a vaporous state. The water from the damp timber is then drawn off, and eupion, previously sufficiently purified, is heated in the still, from which the vapors enter the chamber. When the wood is considered sufficiently impregnated with the eupion vapors, the surplus vapor is drawn off, and vapor from a still containing creosote, also previously purified, is then admitted and finally boiling liquid creosote is introduced into the chamber by a pipe in a quantity sufficient to cover all the wood therein. After the whole has become cold, the wood is removed from the chamber.

He describes the following experiment, made by him "on a balk of good oak which was rather in a damp condition, the same was fourteen inches square, and about ten feet long, which, on being submitted to the vapors of eupion for about six hours, when cut in two parts, was found to be impregnated proportionately, even to the heart, with eupion, and when the two parts were afterward submitted to the vapor of creosote, and boiling creosote, the same was found to have taken effect within 12 hours. But subsequent experiments have proved that it is better to submit the wood or timber for a comparatively short time to the action of the vapors of eupion and creosote, and depend more on the liquid bath as described, this process being less liable to crack the wood or timber than the vapors."

Moll's Simplified Process.

Where it is not thought a matter of importance whether the timber be chiefly penetrated with creosote or eupion, the former of which I consider the chief agent against dry rot, or where the operation is chiefly performed in order to prevent the effects of penetration of water into the wood, or where it is judged to be immaterial, whether these fluids convey any acidity into the timber, and when the proportion of eupion and creosote contained in the tar is well known, the operation may, of course, be much simplified by letting the vapors or liquid products of tar, or other matter containing eupion or creosote, or both, enter into the timber. But I am bound to state that the above-described method of washing the substances, and applying them separately, will be found far superior in use, as the volatility of the eupion and its fluidity will allow its rapid penetration into the timber more perfectly than when in combination with the creosote, whose entrance the former will greatly facilitate when once lodged in the pores through the affinity of the two substances, and as by these means the quantity of eupion can be regulated which is to be absorbed by the wood; moreover, the antiseptic power of the creosote will be augmented by the washing and freeing from matters mixed with it."

Louis S. Robbins' Process.

The process just described by Moll as his simplified operation, was re-invented thirty years thereafter, and patented here, A. D. 1866, by Louis S. Robbins, of New York, and the patent was lately purchased by "The National Patent Wood Preserving Company," by whose order a pamphlet was published last year under the title of "Discovery of a Lost Art of the Egyptians."

Robbins, like Moll, uses a chamber, in which the wood is placed; Robbins also uses a retort, or still, in which, like Moll, he heats coal-tar and introduces the vapors from the retort into the chamber by a gradually increasing heat, lets off the water from the damp wood, and impregnates the wood with the vapors of coal tar, which he calls "oleaginous vapors," while Moll calls the same "eupion and creosote." Robbins says further, that he does not limit himself to any particular form of apparatus, nor does he intend to limit himself to the removing of the surface moisture from the wood by means of oleaginous vapors, as there are various ways in which the same can be accomplished with the use of heat. "But what I claim as 'new' is the process consisting in, first, removing the surface moisture from the wood, and then charging and saturating the same with hot 'oleaginous' vapors and compounds, also removing the surface moisture from the wood by means of hot oleaginous vapors."

We suppose that Robbins did not know of Moll's process, as he says in his specification: "From the above description it is apparent that by my process I am enabled to more completely saturate the wood with the preservative compound than has been, or can be done, by any of the processes heretofore in use, for the reason that I cause the preservative compound to permeate the pores and fibres of the wood in a *vaporized state*, while in the others it is made to enter in a liquid state."

John Bethell's Process.

Patented in England in 1849. He applies the "creosote," or coal tar, in its liquid state, without any previous purification. The wood is placed in a pressure tank, from which the air is exhausted previous to the introduction of the "creosote," which is then forced into the pores of the wood by a pressure pump. Bethell's process, being the most simple and quickest in its operation, was extensively used, and of the results we have reliable reports.

David Stevenson, the eminent English engineer, states that although highly recommended to him by Bethell, he found such creosotized wood to be wholly unfit for use on piers or other water structures, as it was soon destroyed, perforated, and eaten off in places where the creosote abounded, though the most favorable location had been selected for trial, and every precaution used by Bethell in the preparation, the wood having been creosotized after being cut into shape in which it was applied. (*Civil Engineer and Architect's Journal*, vol. 25, page 205. London, 1862).

Wm. Jerry Walker Heath reports (*ibidem*, vol. 29, page 301, 1866), that square rail ties sent by Bethell for use in South America, even when laid on the best sandy ground, were soon totally destroyed.

John Bethell himself stated (*ibidem*, vol. 29, page 323), at a meeting of the association of the engineers, that he received from Belgium rail ties of the round shape back, which were previously creotosized by him in the best manner, and which were then found to be hollow like a cannon, the heart being all gone, and the outer part representing a black, hard mass.

Failure of Coal-Tar Oil for the Preservation of Wood.

The causes of the failure are explained by the fact that coal tar does not yield any creosote, even if treated in like manner as wood tar, which often yields as much as 25 per cent. of creosote. The substance obtained by the treatment of coal tar is carbolic or phenic acid, which differs materially in its properties from the real creosote. Being an effective disinfectant, carbolic acid does not prevent fermentation or putrefaction; on the contrary, Ilisch, of St. Petersburgh, found that some substances impregnated with a solution of carbolic acid showed the formation of mould within a fortnight. This circumstance, taken in connection with the fact that coal-tar resinifies and hardens quicker than wood tar, explains the failures observed by Hyett, Stevenson, Heath and others, when used in a wet place, where the tar cannot quickly dry and form a hard coating. This also explains why nothing but a hard mass outside remained in the rail tie spoken of by Bethell, where all wood within was gone, leaving the resinified tar as the "hard, black mass." Such is similar to the experience of coachmakers relative to hubs, which, when painted with oil color before being well seasoned, soon rot on the inside. Experience and science seem to teach that the use of coal tar or its products is, in most cases, more detrimental than advantageous for the purpose of preserving wood.

[From the Scientific American, July 31, 1869.]

MESSRS. EDITORS:—In referring to an article with the above heading, in your issue of June 12th, it is not my intention to enter into a history of the various trials with the products of the destructive distillation of carboniferous bodies belonging to the coal series. Your correspondent's paper is very elaborate in this respect. My purpose is simply to relate some experiments not recorded by him, and which were undertaken by Mr. Rottier, Professor of Chemistry at the University in Ghent, Belgium, in order to determine what ingredients of coal tar are most effectual in protecting wood from rot. An account of these experiments may be found in the *Breslauer Gewerbeblatt*, of 1865, page 152. Rottier's experiments extend over the following constituents of coal tar: 1, The light oil; 2, the oil containing phenic or carbolic acid; 3, the oil containing aniline; 4, the naphthalized oils; 5, the solid residue; 6, the green fluorescent oil distilling between 275 and 320 Centigrade, containing pyren and paranaphthalin.

The light oil was found to be of no avail, for the wood treated with it decayed within the same period of time as wood that was not treated at all. The delay in time in the decomposition produced by the aniline oil amounted only to 6.66 per cent. which, indeed, is a very insignificant period.

It is well known that carbolic acid affords an excellent means for preserving animal matter from putrefaction. This fact has led to the conclusion that the heavy tar oils would be as excellent for preserving wood, they being the chemist's source for carbolic acid. Rottier found this hypothesis not confirmed. Decomposition set in after the usual period of time, whether the acid was employed in solution, in benzine, or otherwise. Tar oils which contained not a trace of carbolic acid proved to be just as ineffectual as oil to which a considerable portion of the acid had been added. Naphthalin has proved to be very powerful in protecting collections of natural objects against the ravages of insects. It might, therefore, appear that it was the proper agent for preserving wood. This is not the case, it being too volatile to be adapted for the purpose in question where time and external agencies play such an important part. However, quite favorable results were obtained with the greenish fluorescent oil that comes over at the last stage of the distillation. Direct trials with pyren and paranaphthalin did not yield successful results. It must, therefore, be concluded that it is the green fluorescent oil to which the preserving action of coal tar must be attributed. "Is the same contained in sufficient quantities in the latter as to justify its employment for preservative properties?" I am inclined to answer this question in the negative, rather than in the affirmative sense. ADOLPH OTT.

Metallurgy.

MOSHEIMER'S
Pioneer Mining School
—AND—
METALLURGIC WORKS.
ESTABLISHED........................1858.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of

Chemistry, Assaying and Metallurgy,

That I am prepared to teach all the above branches in less time than in any European School.

I also undertake to work any kind of ore, or mineral substances.

Special attention I would call to all parties who have the so called rebellious ores, that I undertake the construction of any kind of Smelting, Chlorination, Amalgamating, Refining, or Manufacturing Works.

I refer not to single persons, but to all the works which I build in the States of Nevada and California, all of which are in successful operation.

For terms, apply to JOS. MOSHEIMER,
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 16v19-3m.

Metallurgical.

The undersigned respectfully announce to the public (especially to parties interested in mining) that they have opened an office at

No. 36 FREMONT STREET,

And WORKS at H. J. BOOTH & CO'S FOUNDRY, northeast corner First and Mission streets, San Francisco, where Ores in small or large quantities of all kinds can be worked by Pan Amalgamation, Chlorination or Smelting, and all kinds of Assays and Analyses made. We will also sample any Ores entrusted to our care; and in all cases returns made in the shortest time possible. We will give consultations on the best methods of successfully working Sulphurets or Refractory Ore.

Drawings Furnished for Quartz Mills, Smelting and Chlorination Furnaces.

By having had long practical experience in working Gold, Silver, Copper and Lead Ores, we hope thereby to get a share of the patronage of the mining public.

☞ Mines Examined and Reports made.

New Almaden Vichy Water,
(CALIFORNIA VICHY WATER.)
FROM THE SPRINGS,
NEW ALMADEN,
Santa Clara County.

F. L. A. PIOCHE .... **Proprietor**
O. CHAUVIN .... **Agent.**

OFFICE, 506 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the veinous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever:* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

Reading for the Hour.

Useful Properties of Water.

All substances are expanded by heat and contracted by cold. This is true of water, except within very narrow limits of temperature. Thus, when a kettle full of water is put on a stove, the water, being a very poor conductor of heat, can be heated only by having its different particles brought in contact with the source of heat, and this is accomplished in the following manner: The particles in contact with the hot bottom of the kettle expand, and thus becoming specifically lighter, rise, while their place is taken by colder particles, which are in turn heated and rise; and in this way a circulation is established, by which all the particles are brought in contact with the heated bottom of the kettle, until the whole mass is raised to the boiling point.

Again: if ice is put in water, the part in contact with it is cooled, rendered heavier and sinks, and a circulation is established as before, and the water cooled until it reaches a temperature of 40°. Here, however, a change takes place, for, by its peculiar constitution, water at 39° is lighter than water at 40°, and, therefore, remains at the top—and now the colder the water becomes, the lighter it grows, and although it may readily be frozen at the surface, yet, on account of its poor conducting power, it remains below at a temperature of 40°. And ice is lighter than water, and so floats on its surface, although most substances are heavier in a solid than in a liquid state.

This exception to the general rule is a wonderful provision of nature. Were it not for this, in winter ice would form at the bottom of a pond or lake, and the freezing would continue until the whole was changed into a solid frozen mass. Life then would be rendered impossible, and the denizens of the deep would no longer exist. In the summer the surface would melt to the depth of a few feet only. Again, the soil being more or less saturated with water, would be frozen many feet deep, and plants and trees could not live.

There is another quality of water of great use in preserving vegetable life in the winter. Water in all its conditions is a very bad conductor of heat, and especially bad is snow. Hence, a snow-covered soil cannot easily lose its heat, and its temperature does not fall much below the freezing point in the coldest weather. So when the winter sets in, nature covers with a warm frost-blanket the soil and tenderly protects the delicate plants.

THE Capitol hall at Sacramento seems to have passed off successfully in most respects. But as some people are always dissatisfied, so we find on this occasion a certain reporter, who has spoken in derogatory terms of the supper. The caterer rejoins, defending himself manfully, and asserting that the food was well worthy of the city and of the Legislature, calls upon the paper which publishes the report to be more particular not to print articles in this way, which may detract from the dignity of Sacramento and Sacramentans, and concludes with the insinuation that the above mentioned reporter was seen gliding from the place with a bottle of Clicquot under his arm. No more conclusive evidence of the excellence of the supper could be given than this last fact.

DOWNIEVILLE is evidently doomed. We have been expecting every moment to hear of its being swallowed, since we read the following telegram: "There was a *severe earthquake* at Downieville, to-day—the *severest ever experienced*. NO DAMAGE." When the place finally disappears, will the telegraph operator add the gentle sarcasm "no damage?"

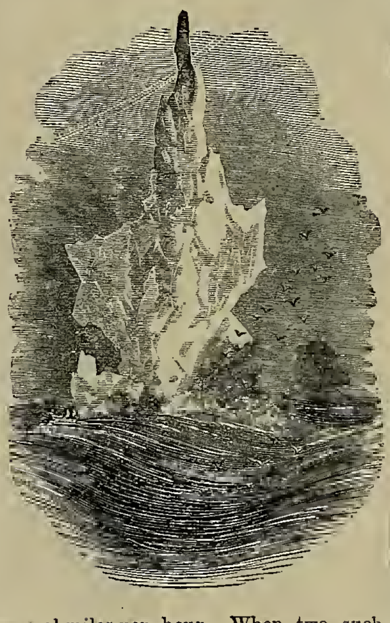
Ice-fields and Icebergs.*

In every part of the ocean the mariner has to guard against the perils of hidden shoals and sunken cliffs; but the high northern waters are doubly dangerous, for here, besides those rocks which are firmly rooted to the ground, there are others which, freely floating about, threaten to crush the vessel to pieces.

To these movable shoals various names are given. They are *icebergs* when they tower to a considerable height above the waters, and *ice-fields* when they have a vast horizontal extension. A *floe* is a detached portion of a field; *pack-ice*, a large area of floes closely driven together; and *drift-ice*, loose ice in motion, but not so firmly packed as to prevent a vessel from making her way through its yielding masses.

The large ice-fields which the whaler encounters in Baffins Bay or on the seas between Spitzbergen and Greenland, constitute one of the marvels of the deep. When they first descend from their northern strongholds, the ice of which they are composed is from ten to fifteen feet thick, and their surface is sometimes tolerably smooth, but generally covered with numberless ice-blocks, piled upon each other in wild confusion to a height of forty to fifty feet, the result of repeated collisions. Before the end of June they are covered with snow, which, melting, forms small ponds or lakes upon its surface.

Not seldom ice-fields are whirled about in rotary motion, which causes their circumference to gyrate with a velocity of several miles per hour. When two such fields come into collision, each weighing many millions of tons, imagination can hardly conceive a more appalling scene.



Icebergs are formed by pieces falling off from the glaciers of the northern highlands. They are often of huge dimensions. Dr. Hayes measured one, and calculated that its cubical contents were about 27,000 millions of feet, and its weight some 2,000 millions of tons. Capt. Ross mentions another 4,169 yards long, 3,689 broad, fifty-one feet high above water, which was aground in sixty-one fathoms; its weight was estimated at 1,292,397,674 tons.

In a high sea the waves beat against an iceberg as against a rock, and when there is a swell, the noise made by their rising and falling is tremendous. Their usual form is that of a high vertical wall gradually sloping down to the opposite side; but frequently they exhibit the most fantastic shapes.

The wonderful beauty of these crystal cliffs never appears to greater advantage than when clothed by the midnight sun with all the splendid colors of twilight. "The bergs," says Dr Hayes, describing one of these enchanting nights, "had wholly lost their chilly aspect, and glittering in the blaze of the brilliant heavens, seemed in the distance like masses of burnished metal or solid flame. Nearer at hand they were huge blocks of Parian marble, inlaid with mammoth gems of pearl and opal. One in particular exhibited the perfection of the grand. Its form was not unlike that of the Colosseum, and it lay so far away that half its height was buried beneath the line of blood-red waters. The sun, slowing rolling along the horizon, passed behind it, and it seemed as if the old Roman ruins had suddenly taken fire. In the shadow of the bergs the water was a rich green, and nothing could be more soft and tender, than the gradations of color, made by the sea shoaling on the sloping tongue of a berg close beside us. The tint increased in intensity where the ice overhung the water, and a deep cavern near by, exhibited the solid color of the malachite, mingled with the transparency of the emerald, while in strange contrast, a broad streak of cobalt blue ran diagonally through its body. The bewitching character of the scene was heightened by a thousand little cascades which leaped into the sea from these floating masses."

Though often dangerous neighbors, the icebergs occasionally prove useful auxiliaries to the mariner. From their greater bulk lying below water, they are not perceptibly influenced even by the strongest gale, and thus their broad masses not seldom afford protection to ships mooring under their lee.

* From "The Polar World: a Popular Description of Man and Nature in the Arctic and Antarctic Regions." By Dr. G. Hartwig. For sale by A. Roman & Co.

PROF. MARSH ON THE GIANT.—The Buffalo *Courier* gives a private letter from Prof. O. C. Marsh, who has made a careful examination of the Cardiff giant, and pronounces it not only a humbug, but of recent origin. We quote a few sentences: "The peculiar position of the body and limbs, which has occasioned so much remark, was determined, in a great measure, by the form of the block of stone, which was water-worn, on at least three of its sides, before the sculptor began his work. These rough water-worn surfaces were not entirely removed in cutting. Portions of them still remain on the sides of the head and on the limbs and feet, and have erroneously been regarded as indicating for the work a high antiquity. The tool marks are still very distinct on different parts of the statue, especially where they have not been obliterated by the imperfect polishing which evidently completed the work. In several places they are surrounded by the water-worn surfaces, and therefore are of subsequent formation. Now, as gypsum is soluble in about 400 parts of water, a very short exposure of the statue in the locality at Cardiff would suffice to liberate all traces of tool marks, and also to roughen the polished surfaces; but these are quite perfect, and hence the giant must have been very recently buried where discovered."

SOUND FIGURES.—What are determined sound figures may be produced in various ways. One is, to fix a plate of glass at its center with Burgundy pitch to an upright support on a stand, then to dust the plate with fine dry sand or other suitable powder, such as lycopodium. Now if the plate be made to vibrate by drawing over its edge a violin bow, the dust will in time arrange itself into certain figures. The same effect may be produced by tying over a broad-mouthed glass or goblet a bladder that has been moistened and allowed to dry to a drum-like surface, dusting it with lycopodium or very fine sand, and then placing it upon a piano. Certain lines are visible after the instrument has been played upon, particularly when one chord only has been struck. The blowing of a cornet, using one key, or the tuning of one note of any instrument, near the stretched membrane, will cause it to vibrate, and the dust to arrange itself into form. Thus by due study of the dust lines we may see what sound has been.

YOU think you know all about *walking*, don't you, now? Well, how do you suppose your lower limbs are held to your body? They are sucked up by two cupping vessels, and held there as long as you live and longer. At any rate, you think you move them backward and forward at such a rate as your will determines, don't you? On the contrary, they swing, just as any other pendulums swing, at a fixed rate, determined by their length. You can alter this by muscular power, as you can take hold of the pendulum of a clock and make it move faster or slower; but your ordinary gait is timed by the same mechanism as the movements of the solar system.
—*O. W. Holmes.*

THE SPANISH THRONE has considerable difficulty in finding an occupant. The Archduke Victor of Austria respectfully declines trying to fill it, and the mother and the uncle of the young Duke of Genoa are unwilling that this youth should assume the responsible position. Being King doesn't seem so pleasant a business now as formerly. In case that they are eventually unsuccessful in Europe, the Spanish monarchists have still our Duke Gwin, or Emperor Norton, to fall back upon.

The Mortgage Tax Question.

[Written for the Scientific Press.]

The Constitution of California provides that taxation shall be equal, and the Legislature of the State, in providing for revenue, declares what shall be assessed for taxation. Every description of property, real and personal, including real estate improved and unimproved, merchandise, furniture, debts due, stock in public companies, money on hand and on deposit, money loaned on bond, *mortgage*, etc., etc., is declared assessable.

The justice of taxing mortgages has for years been disputed, and more time has been wasted by our law-makers over this vexed question than has been paid for by the party who seek to evade that wise provision of the Constitution—that taxation shall be equal. All this waste of time might have been avoided, and the tax collected without grumbling, but for simple "tautology" in the law. Real estate is assessed, whether mortgaged or not, and the assessment paid by the owner; but the assessment is generally below its cash value, the percentage varying with the capricious whim of the Assessor or the necessities of the county.

What distinction is there between "debts due" and money loaned, whether on mortgage or any other security? There is a wide distinction in favor of the money-lender, who has security and obtains interest; neither of which the merchant or trader, as a general rule, obtains for "debts due." If money on hand and money on deposit are taxed, why should money loaned upon any kind of security escape?

Whether merchandise, debts, money on hand or loaned, should be assessed at their full value, while real estate is assessed below and frequently at only a fraction of its value, is a question for the consideration of our law makers; but that forty or fifty, and perhaps a hundred millions of money, loaned on mortgage by savings and other moneyed institutions, as well as by individuals, should escape taxation, may be questioned. Expunge the word "mortgage" from the law, and retain "money loaned and money on hand;" then enforce the law, and when a man is in doubt as to what he has, raise his assessment until that doubt is removed. Taxation may then become more equal than it ever has been.

Every man should be assessed according to the value of his property, whether that property be real or personal. Money employed by the money-lender should not escape the burden any more than money employed in mercantile or other business. Every departure from these rules is in contravention of the spirit of the Constitution of the State. M.

AN English traveler in California, who stopped at Clark's ranch, near the Yosemite, thus describes the proprietor: "To look at him, with his rough dress, rougher beard and trousers, stuck, western fashion, into his boots, you might carelessly put him down for a coarse, tobacco-chewing, swearing son of the forest. But take a flower or a fir cone in your hand and ask him what it is. He will give you at once its Latin name in soft measured speech, and with courteous rejoinder. He had a few books in the window of the ranch. I laid my hand at once on Goethe's Faust and Robertson's Sermons. Again and again we met with combinations of contrasts of character in the same individual which, I think, could hardly be found in the Old World."

HARD TO SUIT.—The people of Lima and Callao, who shook in their boots when Prof. Falb foretold the earthquake to take place in October last, are now furious because it did not come off. Sixty thousand of them moved out of their comfortable homes and lived, for safety's sake, in tents outside of the city. They broke half their crockery in moving, were robbed of most of their jewelry by the thieves who were busy during the confusion, and got fever and ague besides. In order to get even, they have burned Prof. Falb in effigy.

NOVA SCOTIA AND OHIO GRINDSTONES.—The "Acadians" take advantage of the extraordinary high tides of the Bay of Fundy, to work its quarries. At low water a huge mass of stone is loosened from its bed and a heavy chain is passed under it and over a large boat, which is placed alongside. As the tide rises, the stone, attached to the bottom of the boat, is floated into a sand cove at high water, and made into grindstones after the tide recedes. This is done with mallet and chisel, the rough parts being first chopped off with a heavy ax. Machinery has been recently introduced, and the small grindstones are now turned in a lathe by steam power. Nearly all the Ohio grindstones are made by machinery driven by steam power. The blocks of stones being loosened from the quarry bed are roughly hewn out, with a square hole in the center. This is placed on a heavy square iron shaft furnished with a 9-inch collar, against which the stone is securely fastened by means of another collar keyed against the side of the stone. The shaft and stone being driven by steam power, two men on opposite sides of the stone turn it off perfectly true, by means of soft iron bars about 6 feet long, and 2 by ¼-inch thick, drawn out to a thin point, which is curved upwards.—*Cor. Scientific American.*

BOOK ON EARTHQUAKES.—A Treatise on Earthquake Dangers, Causes and Palliatives, by Prof. Thomas Rowlandson, comprising Earthquake Dynamics; Earthquake Waves, Sound that attends Shocks, Lime, Mortar, etc., Cosmogony and Seismogony, Phenomena of the Neapolitan Earthquake of 1857, and General Observations respecting Structural Arrangements. Published by Dewey & Co., Mining and Scientific Press Office, San Francisco, 1869, containing 96 pages. Price 50 cents, postage free.

AN ARTICLE OF TRUE MERIT.—"*Brown's Bronchial Troches*" are the most popular article in this country or Europe for Throat Diseases and Coughs, and this popularity is based on real merit, which cannot be said of many other preparations in the market which are really but weak imitations of the genuine Troches.

Pain Killer,

No article ever attained such unbounded popularity.—*Salem Observer.*

An article of great merit and virtue.—*Cin. Nonpareil*

We can bear testimony to the efficacy of the Pain Killer. We have seen its magic effects in soothing the severest pain, and know it to be a good article.—*Cincinnati Dispatch;*

A speedy cure for pain—no family should be without it.—*Montreal Transcript.*

Nothing has yet surpassed the Pain Killer, which is the most valuable family medicine now in use.—*Tenn. Organ.*

It has real merit; as a means of removing pain, no medicine has acquired a reputation equal to Perry Davis' Pain Killer.—*Newport (Ky.) Daily News.*

It is really a valuable medicine—it is used by many physicians.—*Boston Traveller.*

REDINGTON & CO. and HOSTETTER & SMITH, San Francisco, General Wholesale Agents. jal

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS, have just issued a neat little volume of over five hundred well executed wood cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the M. & S. PRESS office, postpaid, for $1.—*New Age.*

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores, Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons,

Sore Throat,

Sudden Colds,

Coughs, Etc.

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to imitate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24v18-4w

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

Mining Notices--Continued.

Arctic Silver Mining Company.—Location

of Works: Cortez, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of September, 1869, an assessment of three dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, or to S. Wenban, at Cortez.

Any stock upon which said assessment shall remain unpaid on the twentieth day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the eighth day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.
Office, 426 Montgomery street, San Francisco. dec18

Cassell Silver Mining Company.—Location

of Works: Cortez, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of December, 1869, an assessment of three dollars aer share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, or to S. Wenban, at Cortez.

Any stock upon which said assessment shall remain unpaid on the twentieth day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the eighth day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.
Office, 426 Montgomery street, San Francisco. dec18

Glenwood Mill and Mining Co., Greenwood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirteenth day of December, 1869, an assessment of twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 418 California street.

Any stock upon which said assessment shall remain unpaid on the tenth day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the first day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.
Office, No. 418 California street, San Francisco. dec18

Idaho Silver Mining Company.—Location

of Works: Cortez, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day December, 1869, an assessment of three dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to S. Wenban, at Cortez.

Any stock upon which said assessment shall remain unpaid on the twentieth day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Tuesday, the eighth day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.
Office, 426 Montgomery street, San Francisco. dec18

Kincaid Flat Mining Company, Tuolumne County, California

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of December, 1869, an assessment of two dollars and fifty cents ($2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 220 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twelfth day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-ninth day of January, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.
Office, 220 Clay street, San Francisco, Cal. dec11

Latawana Mining Company.---Location: Hamilton City, White Pine, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the twenty-second day of December, 1869, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at 614 Merchant street, Room 26, or at 526 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the nineteenth day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. MARTINON, Secretary.
Office, 614 Merchant street, Room 26, or 526 California street, San Francisco. dec18

Pocahontas Gold Mining Company.—Location of Works: Mud Springs, El Dorado County, State of California.

NOTICE.—There are delinquent on the following described stock, on account of assessment levied on the twelfth day of November, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
A D Moore	28	40	$200 00
I W Raymond	32	40	200 00
I L Requa	31	40	200 00

And in accordance with law and an order of the Board of Trustees, made on the twelfth day of November 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the salesroom of John Middleton & Son, auctioneers, No. 310 Montgomery street, San Francisco, Cal., on Wednesday, the twelfth day of January, 1870, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

D. A. JENNINGS, Secretary.
Office, 419 California street. San Francisco. dec25

Pilot Mining Company.—Location of Works: White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of November, 1869, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room No. 7, 428 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Monday, the third day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the eighteenth day of January, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. M. HARRON, Secretary.
Office, Room No. 7, 428 California street, San Francisco, California. no27

Silver Star Consolidated Silver Mining Company, White Pine District, Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the second day of November, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
J M Gridley	59	740	$111 00
J R Patridge	13, 14, 17, 18 20—10 ea.	50	7 50
W P Raymond	7	50	7 50

And in accordance with law, and an order of the Board of Trustees, made on the second day of November, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, 37 New Merchants' Exchange, California street, on Monday, the third day of January, 1870, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.
Office, 37 New Merchants' Exchange, California street, San Francisco. dec18

Taylor Mill and Mining Company.—Location of Works: Georgetown District, El Dorado Co., State of California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the sixteenth day of November, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
T B Bishop	17	500	$150 00
S S Murfey	18	500	150 00
S S Murfey	19	1000	bal. 100 00

And in accordance with law and an order of the Board of Trustees, made on the sixteenth day of November, 1869, so many shares of each parcel of said stock as may be necessary will be sold at the auction house of John Middleton & Son, No. 310 Montgomery street, San Francisco, Cal., on Monday, the tenth day of January, 1870, at the hour of 12:30 P. M. of that day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

SAM'L S. MURFEY, Secretary.
Office, No. 520 Montgomery street, over Sather & Co's Bank, San Francisco, Cal. dec25

Yosemite Mining Company, Oro Fino District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of December, 1869, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 220 Clay street, San Francisco, or to J. T. MACLEAN, Superintendent, at the mine.

Any stock upon which said assessment shall remain unpaid on the nineteenth day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the fifth day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary pro tem.
Office, 220 Clay street, San Francisco, Cal. dec18

To Mining Secretaries:

You will please take notice that the copy for advertisements in the SCIENTIFIC PRESS must be handed in as early as *Thursday* evening. Our paper is published on Saturday, but the last form goes to press early on Friday, in order to afford time for sending out our large edition.

Respectfully,
DEWEY & CO.,
Publishers Scientific Press, 414 Clay street.
San Francisco, Dec. 20, 1869.

N. B.—Companies that insert advertising in our mining journal, where such notices appropriately appear, economize ONE-HALF THE COST of daily publication. Attention given to inserting notices correctly and legally. Blanks for filling out notices furnished free to advertisers.

THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

New Advertisements.

Important to Californians.

The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods CHEAPLY, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

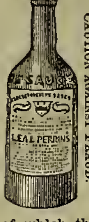
The plant has no enemies; mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $25 per hundred; 20 per cent. off to the trade. Address,

HENRY HUGHES & J. S. SILVER,
1v20-1m 302 Battery street, San Francisco.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.



CAUTION AGAINST FRAUD.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-1yeow

We would call particular attention to our

SCOTT & ECKART CUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Offs at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 50 or 60 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Mont'y Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Plainers, Shapers, Drills, Etc.

On hand and for sale, Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

☞ We are prepared to furnish all kinds of Machinery at short notice, as our facilities are unequalled on the Pacific Coast.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

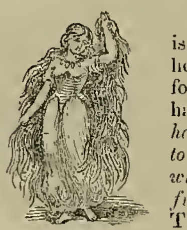
Ayer's
Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.



A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,

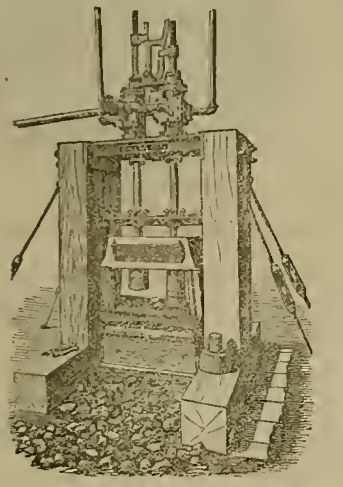
Machinery.

THE WILSON

Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,
Nevada City, California,

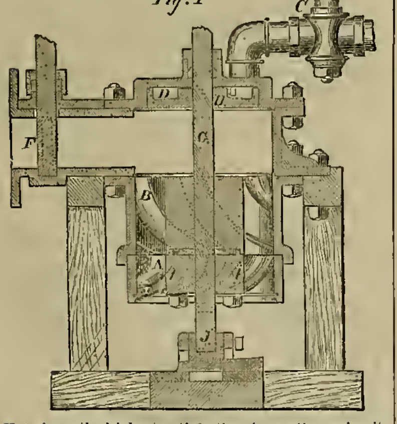
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

Lind's Improved Water Wheel

Fig. 1



Has given the highest satisfaction to parties using it. We are now prepared to sell it at reduced prices. Will also contract for all kinds of Machinery—Flour, Saw and Quartz Mill. All our work guaranteed. We will send competent men to put up our Wheels and Machinery. We contract for or do it ourselves. Our extensive acquaintance with millwrights on this coast enables us to furnish millmen with the best of workmen at short notice. Drawings for contracts furnished gratis. Send for circular.

A. LIND, Millwright,
Pacific Iron Works, San Francisco.

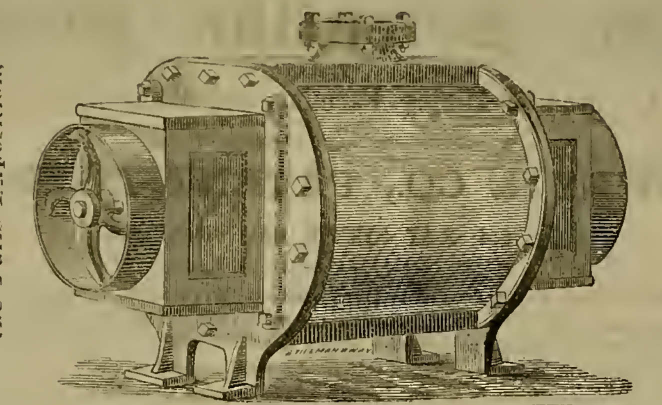
ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

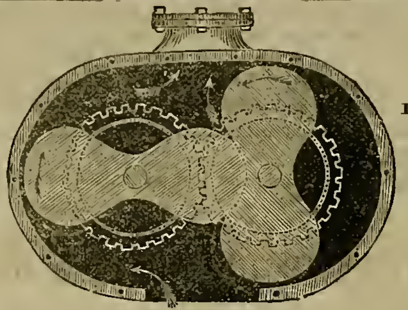
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 21, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

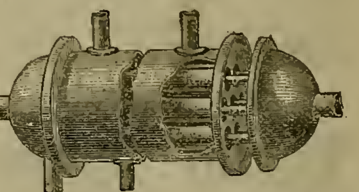
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont street,
1v1 San Francisco.

CROSS' COMBINED

Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

SCIENTIFIC PRESS.—This paper is one of the most valuable published on the Pacific coast for miners, mechanics and farmers. It contains each week illustrations of new machinery, descriptions of new inventions and discoveries, information of scientific developments and mechanical progress, with valuable articles in relation to agricultural and farming interests. All claims of patents issued to inventors on this coast are published in this paper. We can recommend it to our citizens and hope Mr. Murray may meet with success in obtaining subscribers among them.—*Sonora Democrat*

A First-Class Illustrated Newspaper for the Pacific States. Annual Subscription Reduced to $4, January 1, 1870.

The Scientific Press,

A Journal of Mining, Farming, and Mechanic Arts.

PUBLISHED EVERY SATURDAY BY

DEWEY & CO., PATENT AGENTS,

No. 414 CLAY STREET, SAN FRANCISCO.

THE SCIENTIFIC PRESS, devoted to SCIENTIFIC AND MECHANICAL PROGRESS, MINING, FARMING AND MECHANIC ARTS, contains more VALUABLE READING MATTER than any other weekly journal west of the Rocky Mountains. It is the best printed and only finely-illustrated paper on the Coast. Its articles are able, timely, and reliable, and written in a more interesting and easily comprehensive style than scientific papers in general. Now in its twentieth volume, it is printed on superior paper, containing sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe. All our better citizens have an active interest in the new discoveries and in the development and progress of the three great industrial pursuits named above, which are closely allied on this coast and jointly represented in the PRESS, rendering the paper a popular and influential journal with all industrial readers. Subscription reduced to $4 a year Jan. 1, 1870.

The PRESS is the most valuable and best patronized weekly advertising medium in the Pacific States.

To Inventors on the Pacific Coast.

Our U. S. and Foreign PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or description in the SCIENTIFIC PRESS. We transact every branch of patent business, and obtain patents in ALL CIVILIZED COUNTRIES.

The large majority of United States and Foreign Patents granted to inventors on the Pacific Coast during the past few years have been obtained through our Agency. Established in 1860, we have an extensive patent library, with full record of cases on this coast, with complete U. S. reports, and can give the best and most reliable advice as to the patentability of new inventions. Advice and illustrated circulars free. Our prices are now as favorable as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

The Illustration of Inventions

In the SCIENTIFIC PRESS is a high recommendation for them, and is the best and cheapest method of bringing them to the notice of the public in a proper manner, besides being the most effectual method of selling valuable patent rights and patented articles.

Engraving on Wood

Of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also engraving on metals.

DEWEY & CO.,

STEEN & CUSHING,

AGENTS FOR THE
PURCHASE AND SALE
—OF—
Patent Rights, Engines, Boilers,
—AND—
MACHINERY OF ALL KINDS.
NO. 9 FIRST STREET, SAN FRANCISCO.

WE HAVE ON HAND IN GREAT VARIETY,

Engines and Boilers,
Steam and Hand Pumps,
Pipe,
Presses,
Shafting,
Pulleys,
Boxes,
Mill Stones,
Portable Mills,
Malt Rolls,
Injectors,
Lathes and Planers,
Governors,
Steam Gauges,
Quicksilver,
Gas Stocks and Dies,
Belting,
Water-tanks, etc.,

Which we will sell at a discount of 25 to 75 per cent. on cost of new, in this city. Parties having any kind of machinery for sale, may meet with customers by consigning to us. Purchases made on Commission, and prices guaranteed as low or lower than parties can make themselves.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adlis, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,
18v18-9p 519 Front street, San Francisco

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 18v6-1y16p

VOLUME XX.
Number 2.

The Diamond Drill.

Leschot's diamond-pointed drill has been experimenting this week in San Francisco, at the corner of Sansome and Vallejo streets. The machine consists of an oscillating engine, of three to five horse-power, with a screw-shaft with drill passing through it. This drill is of common gas-pipe with a steel boring-head, in which are set rows of black diamonds. The drill revolves, cutting out a circular core. Water is forced through the interior of the drill into the hole which is being bored, and this prevents heating, and washes out the pulp as it is produced. We have previously given full descriptions of the apparatus. The machine was invented by M. Rodolphe Leschot, a civil engineer of Paris, in the year 1863. On its first introduction into the United States, it did not, however, prove a very decided success; at least it was never extensively used. Messrs. Severance and Holt bought out the patent, and have been at work for several years in trying to improve the original apparatus, and claim that they have succeeded in making a practical machine.

We were present at what was announced as a trial of the machine on Thursday, but do not feel able to give a decided opinion from seeing it work only one or two minutes at a time. It is necessary in such cases, to satisfy the public, to give actual working tests. These, however, it is claimed, have been made in the East. As an example, it is asserted that holes of 2⅛ inches in diameter have been bored in Vermont marble at the uniform rate of 13¼ inches per minute. Our general idea is that it will prove a success for boring in slates and similar rocks, but we have some doubts as to its efficiency in hard rocks, as granites, etc. We shall, however, keep our readers informed of any working success of the drill.

* * *

HONORABLE COMPETITION.—An Iowa farmer has offered to be one of twenty or more to give $10, in order to make up a purse to be given to the person who can raise the greatest amount of corn on a given area of ground. Each person to plant any variety he may choose and cultivate in any way he may like. It would be a good idea for some one on this coast to get up a similar purse for a similar object.

* * *

IN the assay of Morning Star ore, reported by W. T. Rickard, in our issue of Dec. 18th, the value per ton of gold and silver were inadvertently transposed. They should read: Gold, $10.04, and silver, $62.83 per ton. In the article "Stetefeldt Furnace vs. Capital," printed Dec. 25th, the sentence "capital can offer no successful resistance to its decrees" should be read, instead of "decrease."

* * *

CALIFORNIA SILK-WORM EGGS WANTED IN FRANCE.—Two gentlemen of the city of Bességes in France, have written to Mayor Selhy, of this city, stating that they have heard that superior silk-worm eggs can be obtained in this State, and asking for information in regard to the matter.

Improved Scroll Saw.

We gave, a few weeks ago, an illustration of an improved planing machine, as an example of the inventive spirit of our young State. We give to-day another example, in the improvements made on the "National Saw," by an enterprising mechanic of this city.

In the old sawing machine, it was possible to exert but one degree of tension on the saw, and this was always made proportionate to the largest size used; moreover, the rake was unchangeably fixed, and the ways were immovable, rendering necessary always a certain length of the saws used. The improvements made in the machine will be easily understood from the accompanying illustration.

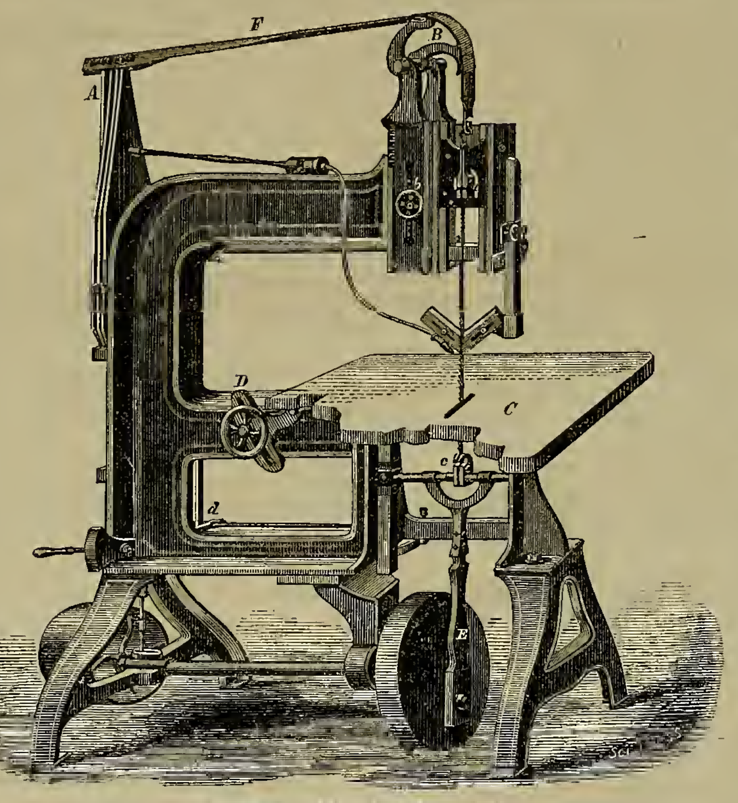
To change the tension upon the saws so as to accommodate it to the various sizes used, there are several springs, A, which are bent at their upper ends so as to hook into slots in the belt, F, which connects them with the oscillating segment, B. By detaching one or more of these springs the strain is much diminished, and that in a degree which is proportionate to the size of the saws, that is, to the thickness of the wood which is being worked.

The upper end of the saw has a short pin passing through it, which is slipped into a curved slot in the block, at *a*. The lower end of the saw is similarly connected at *c*. But in the use of very small sizes of saws, they may simply be placed between the two parts of the blocks (either the upper or the lower), which, being screwed together by means of the nuts shown in the illustration, hold the saw by compression.

The upper block is connected with the segment, B, and receives its upward motion through this from the springs, A. The motive power is applied to the saw by means of the pitman, E.

The upper set of ways are movable, and can be raised or lowered by a rack and pinion operated by a hand-wheel, *b*. By means of this device the use of different lengths of saws is rendered possible.

The handle, shown in the lower left hand corner of the cut, is attached to a series of levers (a portion of which are shown at *d*, the rest being hidden by the body of the machine), by means of which the angle of the ways may be varied, and any desirable change in the rake of the saw may be effected.



T. STEBINS' IMPROVED SCROLL SAW.

In order to give the table, C, any desired inclination sideways, without making necessary too large a slot for the passage of the saw, the journals are so constructed that their center of motion is just at the upper surface of the table. The table is held in any position by means of the hand-wheel and the slotted segment shown at D.

This machine was exhibited at the Mechanics' Fair, and cut out forms and patterns which were almost marvels of jig sawing. It is operated with great ease and simplicity, and is less liable to break in the hands of an inexperienced workmen than other saws. The inventor intends making a smaller size machine for small job work. His aim is to accommodate the home demand for scroll saws in regard to style and price, and insure purchasers a durable and efficient tool.

The inventor of these improvements is Mr. Timothy Stehins, 15 Fremont street, San Francisco.

* * *

Rocky Mountain Heights.

We noted at the time the fact that Prof. Whitney, with a party of about a dozen persons, mostly from the Harvard Mining School, was making, last summer, a topographical survey of the South Park of Colorado. A short time ago Prof. Whitney gave an account of the explorations made, and of some of the results obtained, before the Academy of Sciences.

A careful topographical survey was made of the South Park, and of the adjacent mountains as far north as Gray's Peak. The elevations of various points are determined by the barometer, as compared with the elevation of Denver. The rain interfered much with the work, but still a very considerable amount was accomplished.

It would appear that there is a considerable number of peaks around South Park, which vary in height from 14,000 to 14,500 feet. The highest peak ascended by the party was named Mt. Harvard, which was determined to be about 100 feet higher than Gray's Peak, the highest point east of the Arkansas river. Mt. Yale and Mt. Lincoln are a little lower than Gray's Peak. There are quite a number of heights in this range with nearly equal or even greater elevations, perhaps, than those named; but more extensive investigations are necessary before the dominant peak can be determined.

As soon as the elevation of Denver is correctly determined by the completion of the railroad survey to that place, the different heights above the sea of the several mountains can be accurately estimated.

* * *

SETTLEMENT IN COLORADO.—In New York they are getting up a colony for settling in Colorado. Horace Greeley figures prominently as the President. The colony is to number about 800 persons, with a fair cash capital with which to purchase lands, erect buildings, and make necessary improvements. The locality has not been decided upon, and a committee is to be sent out to select the best possible site.

This getting up of colonies is becoming quite popular in places, the object being not to form exclusive communities, but simply to economize and to avoid mistakes which might result from individual, unconcerted action. The principal trouble must be to get good managers, and thus make a fair beginning. Once really settled, a colony can care for itself.

* * *

WE have received a pamphlet on "Oregon, its Resources, Soil, Climate and Productions" from the Board of Statistics, Immigration and Labor Exchange, of Portland, Oregon. Its object is to disseminate knowledge of the resources of the State, and induce immigration. The pamphlet is very concisely written, containing a large amount of information in a small space, and presents a very pleasant picture.

Communications.

Mills and Mines of Colorado.

BY ALMARIN B. PAUL.

[Written for the Scientific Press.]

Editors Press:—During my sojourn in Colorado, I propose to give the country a critical examination, more, however, in a milling, than in a mineralogical sense. It has been the seat of much "scientific" experimental milling, and hence there is much to see that is interesting, and I am satisfied, something to learn.

Being so much nearer to New York, Boston, and other of our Eastern cities, where laboratory experiments have proved so wonderful in the production of the precious metals, *savans* have centered here more than in California or Nevada, and, as you may suppose, there are heaps of ruined hopes and fallen castles. I shall review them, not in a spirit of contempt or arrogance, but that Coloradoans may get California ideas, and that your miners may see what Colorado has done in the interests of mining. It must not be thought that there are not good works and experienced miners in this community, as there is displayed in many instances much judgment and skill, and I think in some things we can imitate them with profit.

I will commence at

North Empire,

Situated some 10,000 feet or more above the level of the sea, and from thence travel down to the plains via Georgetown, Idaho, Central City, Nevada and Black Hawk. Upper Empire contains some seventy-five houses, and not over that number of individuals at present. There are two mills directly in the town, one of which was running at the time of my visit.

The Peck Company's Mill

Is of quite an odd pattern to a California eye. The stamps, twelve in number, being very long and narrow, 1¾ stems, look rather antiquated; but this is not the important feature. It was in this mill that the Williams, M. D., *alias* "Quilp," *alias* Jefferds process, was introduced. Here are four reverberatory furnaces so constructed that an intense heat is given to the hearth on which the ore rests, and the flame further utilized by passing it over the surface of the ore in the chamber above. By the side of and connected with the furnace is an apparatus for the generation of chlorine gas, a stream of which passes into the ore chamber. The argument was, that chlorine, being heavier than the vapors of gold, which are supposed to be created in desulphurizing, would press down on the surface and hold the metal for amalgamation.

From the looks of things, I judge something was at fault—either the chlorine would not hold on to the gold, or the gold was not in the ore for the gold to hold on to. Connected with the process were several wooden barrels, into which the ore was placed for amalgamation, and into which were introduced, as precipitating agents, sulphates of iron for gold, and metallic iron for silver. One cannot but feel sorry to see so much capital, enterprise and ingenuity prove unprofitable.

The Ores

In this vicinity are very rebellious, carrying a great deal of iron, in fact, in some instances, being almost solid bodies of it, in which also is intermixed more or less copper. Notwithstanding that the ores are so difficult to work, large amounts of gold have been taken out of the several mines hereabouts, which are now being worked to a fair profit.

The second mill referred to is known as that of

The Equitable Company

Of Philadelphia. This contains a rock-breaker, two Chili mills and copper plates. There were previously in the mill four tubs as settlers, but these have been taken out. The fact that the mill was running, proved that the rock must contain metal, and, to my mind, must be pretty good ore to pay with such simple, and, I may say, poor, amalgamating contrivances.

There is a great lesson in glancing at these two mills, standing within a stone's throw of each other—one the seat of the highest order of scientific metallurgy, the other of the most simple and practical system; one killed by too much science, the other not paying as well as it should, from having too little. The formation hereabouts is granite—mountains irregular and very high, ranging from 9,000 to 12,000 feet above the level of the sea.

Among the Mines,

I will mention the Conqueror, a vein some fourteen feet in width, carrying gold and sulphurets of iron and some copper. The Rosecranz has about the same character as the Conqueror, with veins some eight feet in width.

Silver Mountain lode is a vein ranging from two to five feet in width, and has produced considerable metal, and, in fact, has the best looking ore which I have seen. Though the title is Silver Mountain, the precious metal is mainly gold.

The Starr Company

Own the next mill in line. Here are twenty-four stamps of about 500 pounds each, with some six amalgamating pans. The pan is of the style known here as the "Freiberg," being five feet in diameter, with very heavy wooden mullers with iron shoes, of the style used by some mills in Washoe in 1862. There is a style in both stamps, cams and pans, which has rather an odd look to a California miner; there is not that perfection in symmetry and boldness in appearance as with us. I would say to my readers, they must not judge too rashly, however, as to Colorado milling, as the mills spoken of were amongst the earliest constructed in the Territory.

Sketches of El Dorado County.

[Written for the Scientific Press.]

Editors Press:—Coon Hollow Hill, of which I made mention in my last, has been one of the richest mining localities in the State. From the surface of less than 150 acres worked, not less than $5,000,000 have been mined out since 1850. I have seen $515 washed from one pan of gravel taken from the bottom of a shaft, in 1851.

The Alderson Claim.

The Alderson Brothers have been operating here for some ten years with hydraulic pipe. The face of their bank is now over 125 feet in height, of which only about 25 feet pay. They purchase from the South Fork Canal about 400 inches of water, which is conducted through an 11-inch pipe to the foot of the bank, and thrown in five streams through nozzles varying from two to four inches in size. This firm has absorbed most of the claims adjoining their original ground. The amount of money taken out by them can only be *guessed* at, as they keep their own secrets; but they are judged by the community to be wealthy.

The green and blue gypsum in which the gold is found, when separated from the gravel, is a great fertilizer for gardens, vineyards and fruit trees; and prodigious growth has been the result when applied to fruits.

Opposite to Coon Hollow, on the north side of Hangtown Hill, and within the corporate limits of this city, is

Oregon Hill,

A spur similar to Coon Hill, which has been remarkably rich. Only the surface from two to five feet in depth has been worked. A large amount of float quartz at one time was taken from the hill by Col. Jones and others, which, on being worked, paid remarkably well. Much labor was spent in an effort to discover

The Quartz Ledge

From which it was believed the float came. This reward was left to an enterprising miner, who has had a miner's "ups and downs" for a number of years, but who, when bad luck befell him, strove the harder to overcome. Last summer, after making inquiry in regard to this quartz, he concluded to make an effort to discover it. Fixing his starting point on what seemed to be a little vein of broken quartz, not two inches in width, he followed this, and soon was rewarded by its widening to several feet of rich rock. The old Pacific mill has been crushing for him for several months, with results so satisfactory that he is about to erect a 10-stamp mill (hurdy-gurdy wheel) on the claim. When the parties become less reticent, I will give you statistics.

The Pacific Mill and Claim,

Which paid enormous dividends monthly to its stockholders prior to 1850, is situated but a few hundred feet below this claim. Their shaft is 325 feet deep, and good rock is obtained, but the expense of mining it is too great for profitable operations, hence their idleness. About one hundred rods above Oregon Hill is located the

Dickerhoff & Gain Claim,

Which has been worked a number of years by tunneling into the hill, taking out the cement gravel in cars, washing it through sluices, and then letting it lie in the air and slack or soften, when it is reduced by mill, and pays from two to four dollars a car load. The owners have a 10-stamp mill (hurdy-gurdy wheel) nearly completed. They have at the *tail* of their sluice some 6,000 car loads, which paid, I am told, an average of $2 per load. Other claims on this ridge will be mentioned in future.

The U. S. Grant Quartz Company,

On Butte Cañon, nine miles east of this place, has ceased all work except sinking on the ledge. The quartz is of that kind called "rebellious," and much trouble is experienced in amalgamating. Assays show much better results than milling.

Hurdy-Gurdy Wheel Test.

A little question arose here as to whether a 4-foot hurdy-gurdy wheel would produce the same amount of power, with a like amount of water, as one of eight feet. By test it was shown that the only difference was in the friction, which was more in the small than in the large wheel.

A Railroad

Is now contemplated, connecting this place with Sacramento and San Francisco, by way of Vallejo. I am informed by one of the owners of the South Fork Canal, if this road is built, that a canal of sufficient capacity to float lumber will be constructed to the American river. Then we shall have plenty of water, lumber and gold; for a full supply of water is all that is needed to make this city as flourishing as in the palmy days of 1862-3-4. E. N. S.

Placerville, Jan. 1st, 1870.

American Style of Railroad Building. In an article upon railways in India, *Engineering*, after commenting upon the misrepresentations and exaggerated statements which have been made in regard to the "reckless" style in which American railroads are built, makes the following remarks: "Long ago we pointed out, and have often repeated our assertions and arguments in favor of, the American system of railway construction being adopted in India and our other colonies. It is exactly suitable for the purpose. Having to run for hundreds of miles, it may be, through unprofitable country to ultimate objective points, it follows that such lines should be constructed as cheaply as is consistent with safety and moderate speeds. These are not permanent roads; they are but the precursors of the more durable lines, the pioneer ways by which all parts of the country may be united, and which, as the growth of trade and the value of the lands increase, will be slowly reconstructed solidly and at greater cost, so that ultimately the trunk lines of the future railways of India will be what the engineers intended the railways to be in the outset. This is the whole secret of the so-called 'American railway system,' to construct only such works as are absolutely necessary, and to construct them under proper organization."

No More Churns Wanted.—"A singular method of making butter has lately come into quite extensive use in France, based upon the fact, that cream is changed into butter by being simply buried in the earth. The theory is not very intelligible, though the fact is stated to be beyond question; and in Normandy and other parts of France, butter is actually prepared on a large scale in this way. The process consists in placing the cream in a linen bag of moderate thickness, which is carefully closed; then burying the bag about a foot and a half deep in the earth, and allowing it to remain from twenty-four to twenty-five hours. After the expiration of this period the cream is found to have become hard, and it is then broken up by means of a wooden beater into small pieces, and enough water poured upon it to wash out the buttermilk. To prevent any mixture of earth, it is advisable to enclose the bag in a second one of larger size and coarser quality. This method separates the butter more perfectly than the ordinary process; and we are assured that butter thus prepared is of most excellent quality."—*Courant.*

From Liverpool to London.

[From our European Correspondent.]

I think that Americans will all agree that a ride through England is one of the most charming imaginable. To be sure there is not grandeur of scenery, nor wide views of landscape; yet there is a quiet beauty in the green fields and long hedge rows, and in the groves of English walnuts and its quaint old thatched-roof cottages, that the most matter-of-fact person must perceive. The climate of England being one continued rain-storm, with now and then an hour's intermission, make the fields very green, and give to the landscape a magnificent appearance. Add to this a high state of cultivation for several centuries, and it is not so wonderful that the contrast is great, compared to our new and sparsely-settled country.

Sights in Liverpool.

But before going on with my journey through England, I must tell you of the sights that interested me in Liverpool. I noticed what seemed like a small locomotive, with a donkey attached to draw it. Its novelty attracted my attention; and I was curious to know what it could be. There was the boiler and smoke-stack, and smoke coming out of it, and the resemblance to a locomotive on a small scale was almost perfect. As I approached nearer, I saw the poorer class going to and coming from it; and as I stood beside it, I saw these poor people come up and give their half penny, and get one or two steamed potatoes and a little salt, and then go away to eat their scanty meal. It was, then, a potato boiler on a large scale; but it told a tale of that wretched poverty that we in our own free land know little of. And afterwards, as I was dazzled by the splendor of royalty, did these sorrowing faces come up before my eyes and break the charm of the scene. And often have I thought while in England, away with your privileged class, your titled nobility, your fixedness of rank! Have done with the right of primogeniture! If a man is fool enough to spend all his property, let him do so; let him find his proper level. If he has genius enough to rise, let him rise. Break up your vast estates, and let it no longer be said "once a peasant, always a peasant'"

English Railways.

But to return to our ride to London. Of the English railway I will say but little. The cars are much smaller than ours—not more than one-third the size I should judge; and, as Dr. Holland says, made as nearly like a stage coach as possible. They have no conception of the beauty and comfort of our drawing-room cars. We were locked into our compartment, and obliged to stay till the guard opened the door. I will say this much, however: the road seemed to be good and solid, and we rode very smoothly at the rate of thirty-five miles an hour. The engines were plain, without the least bit of decoration, yet strong, and unquestionably serviceable. I noticed that the carriage road, almost without an exception, passed over or under the railroad. With our fine cars, I would pronounce the English roads almost perfect. We passed through Crew, a railroad town, built according to a plan—a new idea in Europe. The houses are all very much alike, and owned by the Northwestern R. W. Co. And then through Staffordshire, famed for its pottery. It was, without exception, the most interesting ride I ever took. It was in early harvest, and men and women were busy with scythe and sickle gathering the crops. The only reaping machine that I have seen in Europe was in Prussia. The cattle and sheep were fattening in the richest pastures. There seemed to be nothing lacking to make the ride as charming as possible.

Arrive in London.

We were for the first time going to London—the largest city in the civilized world—and the novelty of the thought may have added a charm to the ride that no words can describe. On we went, through vast estates, under the highest of cultivation, and we could see the group of peasant cottages—many in the Elizabethian style, with steep, thatched roofs, moss-grown, with narrow windows; and the old chapel, built before the Reformation and often used as a fort, covered with ivy; and the mansion, standing in an artificial grove, with carriage road and entrance gate and porter's lodge. And we passed through Bark Hempstead, and saw the place where Cowper was christened, and close by the moat of John of Runey Mead. But soon we saw the number of houses began to increase, and we found ourselves landed in London.

Mechanical Progress.

The Engines of Those Gunboats.

In *Engineering* for Dec. 3d, we find described and illustrated the engines of the Spanish gunboats built by Capt. Ericsson, the dimensions of which we gave in our last. We quote a paragraph:

"It has frequently been urged as an objection against the twin screw system that the double set of engines, four steam cylinders with duplicates of all the working parts called for on this system, render the whole too complicated and heavy for small vessels, preventing at the same time the application of surface condensation. In the engines of the Spanish gunboats, the designer has overcome these objections by introducing a surface condenser, which, while it performs the function of condensing the steam to be returned to the boiler in the form of fresh water, serves as the principal support of the engines, dispensing entirely with the usual frame work. Besides this expedient, each pair of cylinders have their slide frames for guiding the movements of the piston rods cast in one piece. Altogether the combination is such that the total weight and space occupied by these novel twin screw engines do not exceed the ordinary single screw engines of equal power. Several improvements connected with the working gear have been introduced. The outer bearings of the propeller shafts, always difficult to regulate and keep in order on the twin screw system, are self-adjusting and accommodate themselves to every change of the direction of the shafts. This is effected by their being spherical externally, and resting in corresponding cavities in the stern braces or hangers. The spring bearings for supporting the middle of the shafts are also arranged on a similar self-adjusting principle. The thrust bearing is of peculiar construction, the arrangement being such that the bearing surfaces remain in perfect contact, however much the shaft may be out of line. The reversing gear likewise is quite peculiar, insuring complete control over the movement of the two propellers under all circumstances."

Iron for Specific Purposes.—"The quality of bar iron may differ according to the purpose for which it is to be employed. Wire iron is manufactured in the charcoal forge, and the double puddling furnace with iron boshes. Easily welded iron is made by allowing a small portion of carbon to remain in the metal, and by expelling, as far as possible, foreign matter. But this, by destroying the fibre, will make iron of large dimensions cold-short. By reheating and rolling small rods the carbon will evaporate. If we want fibrous railway, or heavy bar iron, we must employ a metal from which the carbon is easily expelled, as that from the run-out fires. This is to be puddled in a very warm furnace. Wire iron should be of the same quality, but the puddling by which it is produced would be inapplicable for railway iron, for the latter would become cold-short. Iron for small rods, hoops, gas-pipes and wire, ought to exhibit a crystalline fracture, a steel-like grain, which is produced by carbon. But of all other foreign matter it should be free. Silex and phosphorus will not evaporate like carbon on repeated exposure to heat; and iron which contains either in a nonvitrified state will be cold under all circumstances, and will be useless for wire or any other purpose for which strength is required."—*Osborne.*

Notes for Photographers.—Don't meddle with the bath if you can help it. "If it work well at starting, and failures shortly afterwards occur, do not tamper with the nitrate of silver solution by doctoring it, as recommended in many books on photography; the probability is that the fault lies in some other direction, and experience shows that the best plan of action is to interfere with the bath as little as possible. Always preserve the nitrate of silver solution so that it never comes into contact with fragments of cork, dirt, or other organic matter, and take care that at the outset it is made of pure material. When the purchased nitrate of silver crystals are large, transparent, and glassy looking, the probability is that they contain much acid, have not been recrystallized, and are worthless for the nitrate bath. Pure crystals have an opaque whiteness, and when very pure have a slightly dirty look, because the absence of free acid enables them to blacken slightly in contact with the traces of organic matter always present in the atmosphere."—*The Engineer.*

Blast Furnaces.—Mr. I. Lowthian Bell has given to the Iron and Steel Institute,—says *Engineering*,—the results of some investigations in reference to the theory and practice of iron smelting. He considers that the maximum economy which is derivable from the height or capacity of the blast furnace is attained with furnaces of 16,000 cubic feet capacity, and that any increase in height or capacity is unattended by any corresponding economy of fuel. Also with a furnace of 16,000 cubic feet capacity, the temperature of 1,200° Fah. for the blast cannot be exceeded with advantage. These conclusions, derived as they are from a great mass of experimental and theoretical research, will form one of the most important subjects of discussion and investigation for some time to come. The opinions expressed at the meeting by Mr. C. W. Siemens, Mr. B. Samuelson, and others, were divergent in many respects from those expressed by Mr. Bell.

Concentrating Sulphuric Acid.—The *Journal de Pharmacie et Chimie* describes a new method devised by M. Cotello. A column, lined inside with fire-bricks, and made outside of good ordinary bricks, rests on a large pedestal. This column is open at both top and bottom; but in these openings are fitted fire-clay stoppers. The inside is fitted with calcined pumice stone; inside the lower portion, openings are made between the bricks, through which a current of highly heated air is forced. From the top, the acid to be concentrated is made to trickle on the pumice-stone, and, meeting with a current of highly-heated air, the superfluous water is driven off, and the acid, on arriving at the bottom, is in a concentrated state, and runs off in properly arranged vessels.

Mica for Blue Spectacles.—We some little time since alluded to the use of mica spectacles by iron founders, to protect the eyes from the heat and glare to which they were exposed. Masks of the same are now used, and even cylinders enveloping the head. But the latest improvement is the placing a plate of transparent blue gelatin between two layers of mica, thus rendering the spectacles *blue*, a color more grateful to the eyes than white. Attempts to color the mica itself, failed.

Ward's New Steam Engine.—A steam engine, built on a new principle, which was invented by Wm. H. Ward, of Auburn, has just been completed by the Cayuga Chief Manufacturing Company, of that city. It is a 50-horse power engine, weighs but 2,500 pounds, and uses only 5,200 cubic inches of steam per revolution, while a crank engine of equal power would weigh at least 15,000 pounds and use 10,600 cubic inches of steam. It is stated that a 1,000-horse power engine of this pattern will cost only $5,000.—*U. S. Railroad Register, Dec. 25th.*

New Car Stove.—The Whitman stove is made of wrought iron, so strongly put together that it cannot be broken, and surrounded by an outer cylinder of Russia iron, which prevents scorching. But the chief peculiarity of the stove is an arrangement for instantly closing the draft and funnel apertures, when the stove is thrown out of position, by gravitation acting on a simple mechanical device. The stove door is locked, the key remaining in possession of the brakeman.

Forging Bronze.—In the course of some experiments made at the French Mint, M. Riche has found that bell metal, or bronze containing 22 per cent. of tin, can be forged and hammered into plates at a dull red heat,—while it is brittle both above and below that temperature. It is said that the Chinese gongs are made in this way.

Iron Laths—"We have iron roofs, iron fronts, brackets, window-heads and sills, joists, and now we have the additional item of laths, which are made of number twenty iron, wire gauge, and one and a half inches wide, resembling one-and-a half-inch hoop-iron, with a small ridge or head in the middle to stiffen it. The laths are cut into proper lengths, and afford additional security from fire."—*Iron Age, Dec. 23d.*

Ten Years Ago.—In 1859 there was only one blast furnace in Pittsburg. Now there are seven, with an aggregate capacity of 54,600 tons per year. The largest of these has a 14-foot bosh, 50-foot stock, and a capacity of 175 tons per week.

Scientific Progress.

Life in the Deep Sea.

We have more than once alluded to the recent explorations at the bottom of the ocean, and the new geological revelations made thereby. Not only is the once common belief that animals could not live at great depths now proved to be a fallacy, but species supposed to be extinct are furnishing living representatives to the contrary. At the December meeting of the Connecticut Academy of Sciences, Prof. Verrill read a paper upon the subject, which we find reported in the *Yale Courant*, and from which we quote briefly:

"In 1867 an expedition under Count Pourtales was fitted out by the U. S. Coast Survey. Since then two other expeditions have been sent. They dredged mainly in the Gulf Stream region between Florida and Cuba. Collections of exceeding interest were thus made, which are deposited in the Museum of Comparative Zoölogy in Cambridge, and which have been as yet only partly described. The corals (in part) the hydroids, holothurians, crinoids, bryozoa, and brachiopods have been examined by Pourtales, the star-fishes and sea-urchins by Alex. Agassiz, and the Ophiurians by Theodore Lyman. The shells, worms, crustacea and other corals in large numbers remain to be described. The most remarkable things obtained was a cyathophyllum coral of an order supposed to have become extinct in the Carboniferous—a living Paleozoic form! Several species of large Brachiopods, itself an early form, added to the ancient look of this fauna. A Voluta junonia, large and brilliant in color, came from a depth of 350 fathoms. * * * The bearing of these discoveries upon the science of Geology is evident. Many of its theories will have to be at once remodeled. We may no longer regard color in a fossil shell as evidence of a shallow water deposit, nor may we believe any longer that fossiliferous rocks must themselves have been formed in water not over three hundred fathoms in depth. So, too, the discovery of Tertiary, Cretaceous and even of Paleozic forms of animals still living, shows us on the one hand, how unsafe it is to pronounce on the identity of two widely separated formations in age because of a few species common to both; and on the other, it impresses us with the remarkable permanence of species in nature. Sir Wyville Thompson believes that the foraminiferous deposit he examined, and which is now forming, is a continuation of the English Cretaceous; and he expects that the Eozöon, the oldest form of animal life existing in the rocks, but which is also reported to exist in the Tertiary, will ere long be dredged, still living. Lastly, in the region north of Scotland, we see two depositions going on side by side, the one forming a sandstone, the other chalk; and the sole condition which determines the character of the rock as well as of its fossils is a difference of temperature of 15 to 20°, a result entirely opposed to all geological hypotheses heretofore accepted."

Jargonia.—Mr. H. Sorby has observed the spectra obtained from light transmitted through certain specimens of zircon, and has inferred the existence of a new element which he has called jargonium. In the Proceedings of the Royal Society, certain remarkable properties of jargonia are mentioned. We quote: "Its compounds may exist in three different crystalline states, giving three wholly different spectra. The spectrum of the borax bead after flaming may easily be seen with the spectrum microscope, which thus enables us to detect less than one per cent. of jargonia in zircons. The spectrum, however, is different according to the temperature to which the bead has been subjected. Jargons from Ceylon of density 4.70 contain very little jargonia, but those of density 4.20 contain about 10 per cent., in a form which gives hardly a trace of absorption bands. On keeping such a specimen for some time at a high red heat the density increases to 4.60. The mineral then gives a spectrum with 13 narrow black bands and one broader line. No such changes occur with zircons from Miask which are free from jargonia. Mr. Sorby and Mr. David Forbes have both succeeded in making an approximate separation of jargonia by purely chemical methods, but their results must be considered as first attempts and necessarily imperfect."

Albertite and Grahamite.

In our issue of Oct. 30th, we gave Prof. Wurtz's views upon the probable origin of Grahamite. In *Silliman's Journal* for November, Prof. S. F. Peckham notes the different opinions which have been advanced upon the subject of this mineral and those allied. He agrees with Prof. W. in the belief that they are not inspissated petroleum; and after describing the asphaltic sand found in the neighborhood of Santa Barbara, he says:

"This stratum of asphaltic sand lies uncomformably upon the upturned edges of the oil shales, from which the tarry maltha exudes and gradually saturates the sand. Judging from a section of both shales and sand, which appears for nearly a mile along the coast, the saturating process is still in progress.

We have only to suppose this process to take place beneath sixty feet of semi-indurated sandstone, instead of ten feet of sand and soil, and we have the action which preceded the injection of the vein. Again, we have only to imagine a metamorphosis of deep-seated bituminous strata, producing a distillate a thousand or more feet beneath Silurian or Devonian rocks, which gathered in their crevices, and we can readily account for the gathering of the mass of Grahamite or Albertite previous to injection. An earthquake, shrinkage, or the expansive force of pent up gases, may have caused an upheaval and fracture of the superincumbent mass. It makes no difference whether the fractured mass were a thousand, five hundred, sixty or ten feet in thickness; in either case when it fell, it would force a part of the plastic mass into the fissures and hold it there.

At this time only specific names have been given to those bituminous minerals occurring in veins, which are evidently derived from the metamorphosis of bituminous strata. They possess many properties in common, and are essentially unlike the true asphalts, which are derived from petroleum. I think it was Dr. Taylor, of Philadelphia, who several years since proposed the name of 'Meta-Asphalt' as a generic name for minerals of this class."

The Mosasauroids.—These fossil reptiles of the Cretaceous take the place, in America, of the *Ichthyosaurus* and *Plesiosaurus* in Europe. The two groups last named are wanting in the New World, while the first is rare in the Old. Prof. O. C. Marsh, whose description of the *Dinophis grandis*, we have alluded to in a former issue, describes in *Silliman's Journal* a new species of this group, which he calls *Mosasaurus princeps*, the remains of which were found last July in the lower bed of Cretaceous greensand in Monmouth county, New Jersey. These remains were in an excellent state of preservation. Among them were the greater portion of the skull, a number of teeth, about twenty vertebræ, and several bones of the extremities. The skeleton to which they belonged is,—says Prof. Marsh,—"perhaps the largest hitherto found in this country, as when entire, the animal was probably not less than seventy-five feet in length."

Phosphorus the Real Philosopher's Stone.—The December number of the *American Exchange and Review* thus closes an article on this subject: "A particle of phosphorus thus traced from its initial point in the soil to those producers of organic matter and storers of physical forces—plants—and thence to the animal which destroys organic matter and liberates force, becomes, from the functions it fills and the part it plays, possessed of more interest than falls to the share of most chemical elements. The alchemist, now nearly two centuries dead, was doomed to disappointment when he thought to transform, by its agency, the base metals into noble gold, but there was a glimmering of truth in his view of its convertive powers. It helps to change inert, inorganic matter into nutritive vegetable forms; it fulfils a wonderful destiny in the human brain, and the result it there brings about makes it indeed the 'philosopher's stone' in the world's progress."

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Scandinavian Claim.—*Chronicle*, Dec. 25th: After a resting spell of three years, the owners have again commenced work, and are clearing the tunnel of the debris. As soon as they finish timbering, the ledge will be cut into.

Globe.—*Miner*, 25th: About 15 feet a week is made in this tunnel, and the quartz indications are still flattering, though the lode is not yet reached.

AMADOR COUNTY.

Kennedy.—*Ledger*, Jan. 1st: This mine is being worked vigorously, and is promising handsomely. The men are now taking out rock sufficient to keep the mill running with one-half the force heretofore employed. They are in a body of ore, a piece of which before us exhibits plenty of free gold, with sulphurets.

CALAVERAS COUNTY.

Polomo.—*Chronicle*, Jan. 1st: Work is progressing favorably. The shaft is down 290 feet, showing a lead 13 feet in width at the bottom. A large force of hands are taking out rock sufficient to keep the mill in operation day and night. We learn from good authority that the mine is paying handsome dividends.

Railroad Flat.—Cor. of the same: The Petticoat mill will soon be completed, a large force of hands being employed day and night. Several hundred tons of ore are on the dump, and an extensive body of first-class is ready for stoping.

Chapman & Co. have crushed a portion of the rock they had out—some 150 tons. Lack of water, caused by the cold weather, prevented the crushing of the entire lot.

Sanderson & Co. are still running their 120-foot level. No scarcity of $50 rock. J. Herzer has 40 tons of fair ore on his dump. Twenty tons recently crushed at Harris' mill yielded $55 per ton. "Salty" & Co. have 80 tons ready for the mill. The Lewis brothers are still sinking. Rock rich as ever.

INYO COUNTY.

Cerro Gordo.—Los Angeles dispatch says: About one hundred tons of argentiferous gelena were shipped from the Cerro Gordo mines, through here, in December, for San Francisco—valued at over $100,000.

NEVADA COUNTY.

Forest Springs.—*Transcript*, Dec. 28th: The old Norambagua mine is being opened by Wm. Sutton & Co., under a five years' lease. The mine is still as good as when purchased by Cronise & Co. for $100,000; but on account of mismanagement in Cronise's hands, it failed to pay, and was closed down nearly two years ago. There is a tunnel of 1,100 feet in length, which was run at an average expense of $35 per foot, from which the present company propose taking the rock instead of hoisting it up the old incline. The tunnel will be extended 85 ft., tapping the ledge at water level. There is no doubt the mine will pay under the present management, Mr. Sutton having worked in it for 11 years, and knowing just where the pay rock lies. The old mill will be put in order soon.

Perrin's mine, near by, has been paying large profits. Two other ledges which have always paid, but have not been worked regularly for want of capital, are going to work in the spring.

Water Plenty.—The storms have given abundance of water in all the ditches. Should such weather as yesterday continue for a short time, the ice would melt and the miners would be able to go to work in every part of the county.

Rough and Ready.—The mines in this vicinity have a go d su[p y of water and are getting ready for work. Rix & Barker have continued work through the season, and Barnhart & Thomas started up on Monday.

The Banner Mine.—Same of 30th: The Star Spangled Banner Co. are taking out splendid rock. They are employing 40 men, and the mill is kept running night and day. Up to within a week, they run the mill with 20 stamps, but the late rain has given sufficient water to run the forty. They have a large quantity of rock ahead.

Orleans.—This old claim is being prospected by Mein, Parrington & Co. They sunk a shaft, which, when completed, disclosed a ledge four feet in thickness. The rock, estimated at the lowest, will yield $40 per ton, and there are some who are willing to bet that it will go $100. This ledge is only one of many that might be worked in this vicinity at a profit.

McClellan.—Grass Valley *Union*, Jan. 1st: This company is working with success. The ledge is a large one, carrying large quantities of sulphurets, and showing free gold all through the rock.

PLUMAS COUNTY.

Indian Valley.—Quincy *National*, Dec. 25th: Mr. Pulsifer a short time since, discovered a very rich quartz ledge near Crescent mills. From a few pounds of rock worked in a hand-mortar, Mr. P. extracted $370, and some of the rock, exhibited in Taylorville, would pay at the rate of $50 to the pound.

North Arm.—Cor. of the same: The miners in Light's Cañon are hard at work, and the prospects are favorable. Reynolds & Co. are setting their sluices, and will soon commence piping. Fant & Co. are piping, and their prospects are good. Pierce & Co. are making fair wages.

Twelve-mile Bar.—Some of the miners have experienced backsets, on account of the cold weather. Hallsted & Co. cleaned up $400 from a little strip of bed-rock, last week, in which was a nugget weighing eight ounces.

SIERRA COUNTY.

Struck Pay.—Downieville *Messenger*, Jan. 1st: Last Monday the Mike Redding Co., which has been sinking a shaft at the foot of Bald Mountain, above Forest City, struck the bed-rock at a depth of 289 feet, finding excellent prospects. They were sinking for the old Forest City lead, and the indications are that they have found it.

Kanaka.—At this mine a back-lead was struck, on the level of the lowest tunnel, six feet wide, all picking quartz and prospecting well. This vein is 12 feet from the old Kanaka ledge, and gives the opportunity to start up the mill next month on paying ore.

SISKIYOU COUNTY.

Eliza.—Yreka *Union*, Dec. 24th: The quality of rock is daily improving. The owners have entered into a contract with Mr. Taylor, for the erection of a 10-stamp mill, giving him a certain ownership in the mine therefor. Last week an offer of $25,000 was made for the mine by a former resident of this place, but he was too late. The owners had closed the contract with Taylor, who refused to listen to overtures for the sale of any part of the mine.

Good Pay.—Riley & Co. have struck a rich stratum of gravel in their tunnel under the bed of the Klamath river, near Groat's Ferry. Twenty cents to the pan is not unusual in the bed-rock.

YUBA COUNTY.

The Pennsylvania.—*Appeal*, Dec. 31st: The delinquents in this mine, at Brown's Valley, covering about 900 shares, allowed their stock to be sold yesterday. The owners are now reduced to less than a dozen, and we understand that they propose to lease the mine for a season.

Alaska.

Prospecting Expedition.—Sitka *Times*, Nov. 13th: If reports are true, and we have no reason to doubt them, gold is to be found in paying quantities but a short distance from Sitka. The Indians told Capt. Keene, that those who brought gold to Sitka have now got about $30,000, which they took out of the river a short distance from Frederick's Sound.

Arizona.

Big Bug.—Prescott *Miner*, Dec. 18th: L. C. Gray, one of the owners of the Big Bug mill, and C. V. Beseler, Supt. of the Sterling mine, started for Big Bug during the week. The mill was started up Saturday. Parties who own mining claims in the district, upon which the required amount of work has not been done, are bestirring themselves.

Mining Items.—During the week, several miners have come to town from Lynx Creek, and brought dust. One piece weighed $14. It was found in the old Johnson bar....A party of miners are in town to procure an outfit for Black Cañon. ....The Upper Hassayampa is alive with placer miners and all doing well.

British Columbia.

A Victoria telegram, dated Jan. 4th says: Authentic news has been received of placer diggings having been opened in the Peace river country. Not much prospecting has as yet been done, but strong hopes are built upon the first prospects obtained—two ounces per day to the hand—that the new diggings will turn out the richest and most extensive ever struck in British Columbia.

Colorado.

Clear Creek.—Central City *Register*, Dec. 25th: Alexander Cameron shut down five weeks ago. His total yield for the summer was 33 pounds 8 ounces troy, worth $18.13 per ounce in coin. Mr. C. has a mile and 1,200 feet running up the creek, and proposes to commence in March to put in a 20 by 40 inch flume. During the summer he has worked seven hands, and the yield has been $11 per day to the hand.

Ten-Mile District.—The contractors running the diamond drill have reached a distance of 220 feet from the heading. Under favorable circumstances they find no difficulty in boring at the rate of 100 feet in 24 hours. They have crossed one vein of sulphurets 6 inches in width, and three other veins showing crevice material.

Georgetown.—Correspondence of same: The cold weather has put a stop to most of the mining....Bennett & Co. have struck silver ore in Virginia Cañon, where they were before getting gold....In Baker's claim one man is taking out $15 per day with a hand-mortar and pan....An English Company are working, three miles up Fall River, on a large silver lode....In Spring Gulch, Mr. Gray, of Philadelphia, is having a lode developed. The people about Mill City are doing some mining; several valuable lodes having been discovered about there during the summer.

South Pass.—*News*: We have seen the retorted gold from N. Roberts' mill, from Saturday's clean-up. There was $3,500 worth. This is the result of five and a half day's run, of six stamps, on rock from the Cariso lode....A run of 70 tons from the Mammoth, which is from 12 to 20 feet wide, yielded $600, a profit of $6.20 per ton.

Baker Company.—Georgetown *Miner*, Dec. 23d: Two new bullion pulverizers are being placed in the mill. The road from the mine is in good condition for hauling ore. The Company shipped, on Tuesday, a silver brick weighing 1,230 ounces, .708 fine, coin value, $1,125.82.

Idaho District.—Updegraff & Kinney are taking out ore from the Veto lode. There are two shafts run together, one eighty, and the other one hundred feet in depth. The mineral vein is from eight inches to one foot in width. This mine is yielding a profit in the Washington lode, owned by a company in Chicago. The crevice is four feet wide, and the main shaft one hundred and fifty feet deep. A large quantity of good quartz is on the dump at No. 6, Seaton lode. Two weeks ago, there were four tons of first-class ore on the dump.

Griffith Mountain.—The shaft on the Major Anderson is 58 feet deep, and the crevice averages 6 feet. Another shaft is 40 feet. There are ten tons of first-class hammer-dressed ore on the dump. The assay of average rock and select ore are as follows: $239.18, $850.08, and $1,722.28 per ton.

Sherman Mountain.—The shaft on the Eureka is where the Toronto crosses it, and is 34 feet deep. There is ore enough on the dump to pay for all the work done. An assay of select ore gave a yield of $2,116 per ton.

Alpine Mountain.—One large lead lode, called the Fulkerson, is developed in the Daniel Drew tunnel, the average rock of which assay one hundred ounces in silver per ton.

Leavenworth Mountain.—The total product of the Equator mine from the first of April to the first of November, inclusive, was $77,282.14. The whole distance driven on the Linn tunnel is 195 feet. The width of the lode where the tunnel crosses it is 26 feet.

Montana.

Rich Strike.—Helena *Gazette*, Dec. 23d: The Parkinson Bros., on Wednesday, struck a vein of quartz in their new shaft, from three to five feet in thickness.

Clear Water.—Gallatin Cor. of same: Three men sunk a prospect hole 2½ feet deep, and struck bedrock; washed a pan of dirt, and got a 50-cent nugget; washed several more pans of dirt, and got $2.59 to the pan. A Frenchman prospecting one mile from there on Crazy Woman's Fork, came back in a few hours with $10 which he had panned out. The two commenced to build a cabin, and before they could complete it they were driven off by the Sioux Indians. Such is the report.

The New Cedar Creek Diggings.—The *Gazette* gives the following extract from a private letter, dated Dec. 12th: "I have just returned from the discovery, and it is good. Our party prospected three miles from the discovery, and found 39 cents in two pans. Since our return reports have come of $2 to the pan above discovery. The representation day is the 15th of next May, and three days for filing; no claim can be taken for a man without his filing in person. There has an immense crowd gone in.

James Haney,—says the *Gazette*,—writes Dec. 8th, from Burn's Gulch, of ground prospecting from five to fifteen cents to the pan. The gulch is 12 miles long, and the gravel from six to eight feet deep. He advises his brother not to move from here until he hears from him again.

The Virginia *Times* advises everybody to keep quiet until more is known of the new diggings, and names several well-known and reliable men who have gone thither, and will report.

The *New North West* says of the Missoula stampede: "Personally we see no cause yet to disbelieve that good mines have been struck, but exaggerated stories are inevitable in such cases. We expect full advices in a few days. It is midwinter, and the reported mines are 160 or 170 miles from Deer Lodge. Deep snows are liable to fall, and severe weather must be expected."

Phillipsburg.—Same of 27th: There is a controversy between two parties in regard to the lease of the James Stuart mill, which will be amicably adjusted, and the mill will be run on custom work, whichever obtains it. Messrs. Dance, Stuart & Co. have in the mill 70 tons of Hope ore, which will be crushed at once. Possession will be given the lessee on January 1st. The mill will then start up on Mountain Queen ore—of which 400 tons, owned by Merrill, Ullery & Co., are now out. After that, ores from Comanche Extension will be crushed. Messrs. Ullery, Cogswell, Drennan & Heal, Calderwood and Brown will furnish 1,000 tons from 50 feet of No. 3, 300 tons are now out, and 10 men are at work. It has a 40-foot tunnel striking the ledge at a depth of 25 feet, and a 45-foot shaft. Messrs. Cameron, Brown, Waterbury, Drennan & Heal, who have a 72-foot shaft on No. 2, same ledge, showing a 7½ foot crevice, are engaged in taking out ore to follow or precede No. 3.

Latest from the New Mines.—The Virginia *Times* of Dec. 27th gives part of a Missoula letter just received in that city: I have managed to secure a gulch and a bar claim. Seventeen pans that I washed yielded $7.25. There has been as high as $16 to the pan got. To my notion it will be a second Alder gulch. Cedar creek, on which the mines are situated, is about 20 miles long. Good prospects have been obtained on twelve or thirteen miles of it, but the whole creek is staked off and claimed. The mines are seventy-five miles from Missoula, down the river. Tell the boys there is not the slightest use to start for these diggings until Spring, as it is impossible to do anything in the way of work this Winter.

Idaho.

Loon Creek.—The *New North-West* gives these items from a returned miner: About 30 claims are opened. The diggings vary in depth from two and a half to nine feet, all the dirt being shoveled in. Four miles below No. 70, prospecting is going on, and as high as $1.85 to the pan has been taken out on rim rock, but no bed-rock yet struck. The largest nugget yet taken out weighed $265. Ten or twelve companies, owning from 200 to 1,000 feet each, will put in flume early next season twelve feet wide by three feet high. * * There were about 300 people in camp. The ground was frozen, and was "laid over" until June, 1870.

The Dalles *Mountaineer* says: A letter to a Boise paper says: "Within 15 miles of Boise City I have seen rocking out from $24 to $30 per day for the last 20 days, and wheel the pay gravel 400 yards. I expect to make $110 to the hand when I get water to ground sluice next spring,"

Nevada.

COPE DISTRICT.

Placer Mines.—Elko *Independent*, January 1st: A ditch from the Owyhee river is being crowded ahead. Considerable gold has been taken out, and it has been ascertained that the mines will pay from five to twenty dollars per day to the hand.

Bull Run.—Samples of ore from the Porter lode were brought in the other day, which will assay from $6,000 to $10,000 per ton, in silver. The weather has been severe, and but little work could be done.

The Virginia *Enterprise* has seen a box of specimens from Cope. Some of the lumps of ore are almost pure chloride. The box contained also half an ounce of beautiful placer gold in ragged grains,—indicating the near neighborhood of the veins from which it was released. So far, only Chinamen work the placers. They lease them from the white miners, who are all prospecting for quartz.

ESMERALDA.

Silver Peak and Palmetto.—A correspondent of the Sacramento *Union* writing from Aurora says: The mill at Palmetto has been repaired, and is running. The mine is improving, and they are shipping bullion weekly direct to San Francisco. The thirty-stamp mill at Silver Peak has been, since last May, crushing rich gold-bearing rock. The company are about putting up another mill to work silver rock.

HUMBOLDT.

Battle Mountain.—*Register*, January 1st: Thomas Thompson has been negotiating for the sale of ore from the Butte mine. A sample lot taken below, containing five and one-quarter tons, sold for $802.52, or a fraction of $152 per ton. The ledge averages three feet of ore.

A Galena letter to same gives these items from the same district: Mr. Hogan, of Virginia City, is about to lease the Shiloh mine, and contemplates putting on a large force. Work on the Avalanche has been suspended for a few days, owing the illness of the Supt. They have a large quantity of ore sacked and ready for shipment. The air shaft of the Buena Vista is near completion, and the ore house is ready. The Butte owners expect to tap their ledge in a few days. Cotton is shipping a large lot of copper ore from his mine. The B. M. M. Co. (English) have just made a shipment of rich copper ore.

Strike.—A week ago the workmen running a tunnel to the Cumberland ledge, Gold Run, struck a vein of ore. It is three feet wide, and contains two and one-half feet of ore that will yield $300 to the ton by mill process. The owners are Charley Hassen and T. V. Julien.

A Late Discovery.—Messrs. Kunkle and Layson, while prospecting recently, discovered that a ledge which crops out 1,000 feet contained silver. Upon blasting they discovered an immense mass of argentiferous galena, which assays $130 per ton. This ledge had been run over hundreds of times by early prospectors.

REESE RIVER.

Silver Bend.—*Reveille*, Dec. 27th: Last week nine tons of ore from the Arizona mine were hauled to the Manhattan mill for reduction, the average yield of which was $350 per ton. This morning, twenty tons from the Eldorado mine were delivered at the mill.

Ophir Canon.—We learned yesterday that the Cambridge Co. had stopped work on the Murphy. The property looked well, and the closing appears inexplicable. Last week some Mexicans discovered an outcropping mass of ore on the summit of the mountain south, which is represented to be remarkable.

Secret Valley.—Yesterday a pack train brought to the Manhattan mill three tons of first-class ore from the Page and Corwin mine. Twelve more tons of the same are to be brought. Secret Valley, eight miles southwest of Eureka, will produce a sensation next year.

Manhattan.—The total shipment of bullion for December was $88,000.

WASHOE.

Ophir.—Gold Hill *News*, Dec. 31st: Water in new shaft 200 feet deep, and being only slowly reduced by reason of the late earthquake. Another week will make all right,—barring more shocks.

Imperial-Empire.—The little streak toward the Alpha, is a foot wide. They attempted to work upward on it, but were prevented by the heat. The Alpha, Imperial, and Empire are working together in effecting a winze communication. This will give excellent ventilation.

Hale & Norcross.—About 140 tons per day being extracted. The great ore body at the lowest level is looking better and better. Winzes sunk below that show the body to continue at least 50 feet deeper. They employ an additional mill in the reduction of ore.

Chollar-Potosi.—Yielding 200 tons per day; average assays $43 per ton. The new hoisting works operate well, and on the 22d the bottom of the shaft was reached by the cage. The timbering at the head of the head of the incline was found to be in fair condition.

Crown Point.—The drift east at the 1,100-foot level, is in 597 feet from the shaft. The drift east at the 1,000-foot level is in 439 feet. The side drift from it northward is in 171 feet. Nothing encouraging.

Savage.—This mine shows a small improvement within the last few days. Chas. Bonner, the former superintendent. takes his old position to-morrow.

Gould & Curry.—Yield improved a little in quantity and quality. Work is progressing satisfactorily at the lower level drifts, but with no new developments.

Yellow Jacket.—Large quantities of both high and low grade ore being extracted. The mine generally shows a little improvement.

Belcher.—Present yield from 35 to 40 tons of ore per day, car samples of which average from $30 to $90 per ton. This is from the upper levels, where there is good ore enough in sight to last a year.

Virginia Consolidated.—Ross & Co. have completed the shaft to the depth of 500 feet. They are now sinking 25 feet deeper for a sump.

Sierra Nevada.—Mill running all right on ore from the mine, of which there is plenty in sight to last for the next year or two.

Occidental.—Nothing new as yet. Lower tunnel progressing as usual, and the old mine looking well.

Overman.—Yielding 75 tons per day, but this will be doubled, as the main west body of ore has been cut by a drift at the 226-feet level.

Kentuck.—Flourishing finely, and yielding plentifully, as usual.

WHITE PINE.

Weekly Mining Review.—*Empire*, Jan. 1st: Two claims have suspended operations during the week, aside from which, about the usual number of men find employment. The mills are all well supplied with ore, and every stamp has been kept in constant motion. In most cases the supply of ore in front of the batteries will not be exhausted before the first of March. In this will be found the real cause of the suspension of work by few of the leading companies on Treasure Hill. The immense piles of ore that have been shipped to mill neccessitated heavy expenditures. The returns in bullion comes slow, and to continue operations would have made heavy assessments necessary. That these have not been levied, is a conclusive argument against the idea, that San Francisco operators have entered into a scheme to "bear" the leading stocks of the district.

The *News* of same date says. In six weeks from now the awakening will commence, and all business will be galvanized into new life. It is certain that a large immigration will come from California, and a considerable movement of the sort from the East. Chicago and San Francisco have each had substantial evidences, the past few months, of the capacity of our mines; and the effect will be perceptible as soon as movements looking to spring operations commence.

Bullion.—*News:* The total shipments for the week, exclusive of coarse bullion, figure $43,911.37. This falling off is ascribable to the general lower range of the ore value per ton.

The *Empire* gives the total bullion of the year as $2,658,990; and adds that before the middle of June the entire milling capacity of the district did not exceed 40 stamps. With the present facilities, the present year will turn out $8,000,000.

Smelting.—*Empire:* The greatest activity prevails among the operators in base metal. Most of the furnaces have been kept in full blast, and the results are highly gratifying. The exports of base metal bullion are now about 50,000 pounds per week, to be increased to 100,000 pounds within the next 60 days, should the weather continue at all favorable, as there are several extensive smelting works now in course of construction.

Items.—*News:* Aurora Consolidated sends 20 tons of ore to mill daily....The drifts north in the Iceberg mine have developed a body of ore (milling from $75 to $100 the ton) 100 feet wide, and running easterly, as far as known, 80 feet.....Mr. Osborn, of the Chloride Co., expects to do a good winters work....Work on Original Hidden Treasure stopped last night. Tregloan mill, 10 stamps, turns out $2,000 bullion daily....Work on the Little Bilk will be resumed on Monday....Forsythe, of the Mineral Point mine, Base Range, sends ore to the smelters and pays $30 per ton for reduction. It returns from $90 to $200 per ton....The boys on the Rio Grande intend sinking until they find a ledge if it takes a year....Sunbeam has a considerable face of $30-ore....A New York company broke ground on the Blue Hill Tunnel on Thursday.

Items.—*Empire:* Manhattan is putting up an ore house....Eberhardt is operating with a small force, The mine never looked better....California is still shipping ore to Stanford mill....Hartwell has been incorporated with a capital stock of $186,000...Henderson mill has started up again....Wyland's furnace has turned out 10 tons of base metal bricks since Tuesday. The furnace is now lined with sandstone from near Five-mile house.

Oregon.

Big Nugget.—*Sentinel*, Dec. 25: A Chinaman, mining on Succor creek, Josephine county, recently found a solid lump of gold, which weighs $307.

San Francisco Mining Stock Market.

[From the Commercial Herald.]

City Stocks.

We report a dull market for miscellaneous securities. We note a sale of 4 shares California Steam Navigation Co. at 50 per cent., and 21 shares Spring Valley Water Co. at $62 per share. This company will disburse its usual dividend on the 10th inst.——North Beach and Mission Railroad Co. paid its regular ½ per cent. dividend on the 3d.——Sacramento Gas Co. paid its usual monthly dividend on the 1st.——San Francisco Gas Co. disbursed its customary ¾ per cent. dividend since the 1st inst. The annual meeting of stockholders takes place on the 17th inst.——The Farmers' and Mechanics' Bank of Savings announce a dividend of 1 per cent. per month, for the six months ending December 31st, on first-class term deposits, payable on and after the 10th inst.——The Pacific Bank disbursed its usual monthly dividend on the 3d inst.——The Merchants' Mutual Marine Insurance Co. will pay its usual monthly dividend of 1 per cent. on the 10th.——The Occidental Insurance Co. declared a dividend of 1 per cent. per month for the quarter ending December 31st, payable on and after the 8th inst.——Union Insurance Co. also announce a dividend of 1 per cent. per month for the last quarter in 1869, payable on the 12th of the present month.——The Sacramento Savings Bank on January 1, held $1,510,954 on deposit, and had a cash balance that day of $146,606. The savings for the six months ending with December, amounted to $162,787. The deposit accounts number 3,257. They pay a dividend of 1 per cent. for the six months just closed.——The Marysville Savings Bank has announced a dividend of 1 per cent. for the last half of 1869.——The Pacific Insurance Company has declared a dividend of 1½ per cent. per month for the fourth quarter of 1869, payable on the 12th inst.

Mining Share Market.

No very great degree of activity prevailed in the mining share market during the past week, the transactions being confined to fewer stocks, and less volume. A number of leading stocks met with rather free offers, the sales perfected showing a recession from prices obtained the previous week. Generally speaking, there is rather an apathetic feeling in mining stock circles.

Hale & Norcross—was in the market to a moderate extent. During the week ending January 1st, 66½ tons of ore were taken from the upper mine, and 958¾ from the lower mine, making a total of 1,025¼ tons, against 971½ the previous week. Their dumps contain 5,994¾ tons of ore, of which 2,081 tons is low grade. On the 4th inst. they were cleaning out the south drift on the sixth level, preparatory to running cross-cut No. 4. The ore supply from this section of the mine will be increased through facilities which are nearly completed. The ore breasts throughout this level are reported to be looking exceedingly favorable.

Chollar-Potosi—sold as freely as the previous week, at a well maintained price. For the week ending Dec. 31st, they extracted 704½ tons of ore; previous week, 1,155. The Blue Wing locality of this mine is reported to look as well as previous week, showing a slight improvement in the quality of the ore. Made a shipment of $15,480 in bullion on the above day. A dividend of $1 per share is payable on the 10th.——Gold Hill Quartz shows a bullion product of $5,710 73 during the month of December.——Ophir sold at a decreased rate. On the 4th inst., the new shaft contained 145 feet of water. At the old mine, the new shaft has gained a depth of 85 feet.

Gould & Curry—was in lessened request, at a considerable decline. During the week closing Jan. 3d, 346 tons of ore were extracted, and 664¼ sent to reduction works. It is reported that the prospects in the El Dorado section are fair as to the discovery of deposits of ore near where they are at present working. At the 7th station, the main drift north is in 200 feet, running in a heavy body of clay. The west drift has passed through the clay, and has what is termed bird's-eye porphyry somewhat mixed with barren quartz. The main drift south is 230 feet in length, the face showing green porphyry.

Amador (Cal.)—will disburse a dividend of $12 per share from and after the 7th inst.——Kentuck announces a dividend of $10 per share, payable on and after the 10th.——Crown Point levied an assessment of $7 50 per share on the 5th.

San Francisco Prices of Copper Ores.

San Francisco, Jan. 7, 1870.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

New Incorporations.

Hartwell M. Co.—San Francisco, Dec. 29. Capital stock, $1,680,000; 16,800 shares of $100 each.

Joe. Walker M. Co.—San Francisco. Dec. 29. Capital stock, $1,200,000; 12,000 shares of $100 each,

The Farmers' Wharf and Dock Co.—San Francisco. Dec. 29. Capital stock, $200,000; 1,000 shares of $200 each. Trustees: J. H. Bostwick, Wm. Hamilton and F. E. Corcoran.

Occidental Canal Co.—Kern County. Dec. 24. Capital stock, $1,000,000. Trustees: W. W. Hudson, J. W. Freeman and L. F. Humiston.

San Diego River Water Co.—New San Diego. Dec. 24. Capital stock, $150,000. Trustees: A. Klauber, T. J. Frisbie and L. Scott.

California Coöperative Boot and Shoe Co.—San Francisco. Jan. 3. Capital stock, $100,000, in 20,000 shares of $50 each. Trustees: W. M. Farrell, C. Sullivan, E. Bourjinquon, D. McSweeney, J. Miller, J. Laseer and B. O'Donovan.

Meetings, Elections, Etc.

The Academy of Science.—Jan. 3d. The following officers were elected for the ensuing year: Dr. James Blake, President (reëlected); Dr. Kellogg, Vice-President; Leo Eloesser, Corresponding Secretary (reëlected); H. P. Carlton, Recording Secretary, (reëlected); Elisha Brooks, Treasurer (reëlected); Dr. J. G. Cooper, Librarian; H. G. Bloomer, Director of Museum.

Adriatic G. & S. M. Co.—Jan. 4th. Trustees: Camilo Martin, Charles Hirschfeld, James Bole, J. Lewis Schroder, Simon Mayer. Subsequently, Simon Mayer was chosen President, and Paul Neumann, Secretary.

Gould & Curry.—Dec. 27th. Trustees elected: Messrs. Steinhart and Wormser in place of Messrs. Fry and Sunderland; Alpheus Bull, M. Morgenthall, A. K. P. Harmon, I. Steinhart, A. Hayward, Thos. Bell and Isidor Wormser. The officers are: Alpheus Bull, President; Isaac L. Requa, Superintendent, Wm. C. Ralston, Treasurer and Alfred K. Durbrow, Secretary.

Savage Mining Company.—Mr. T. B. Shamp, the superintendent of this company during the past year, has resigned his position. Mr. C. Bonner, who has been superintendent before, is appointed his successor.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

The California Milk-Weed.

Much interest appears to have been excited in this State by the recent appearance of a circular, from an English produce broker, Alexander Macrae, of Liverpool, in which, speaking of the California milk-weed—*Asclepias Syriaca*—he says: "There can be no question that this article, now allowed to run wild and uncollected in the State of California, can be readily made a valuable article of commerce." He further suggests that "there is a fortune in the gathering of this weed and its exportation to this country [England], and the sooner it begins the better."

Its Growth and Appearance.

The variety of milk-weed indigenous to California, grows in great abundance in almost every county in the State, and particularly in San Joaquin. It prefers low, moist ground, and thrives especially on river banks and in marshy places. Mr. J. T. Murphy, in the Sacramento *Bee*, says:

> It generally grows from one to two feet in height, and when in bloom presents a most striking appearance; yet nothing to be compared in liveliness and beauty to when its seed pods are ripe. You will see, as each pod bursts open, a large and beautiful bunch of silky white fiber about the size of a hen egg, and as white as snow. I should judge from the pureness and delicacy of this milk-weed that it far exceeds in quality East Indian hemp, Istle or Mexican fiber, Palmetto leaves of America, China grass of Japan and Mexico, and I am quite satisfied can be spun to imitate the Japanese silk, like the China grass, etc. It is a perennial plant, and belongs to the papernecia class, its stools or roots lasting for several years. Botanists differ as to its place of nativity.

Experiments with the Plant.

Mr. Felix Gillet, of Nevada, furnishes the *Transcript* of that city with some very interesting facts in relation to some experiments which he has been making with the "silk" or pod contents of this plant, which he prefers to call a *silk plant*, rather than a *milk-weed*. It appears that Mr. G. gathered a number of pods, in 1867, took out the silk and sent it to a Lyons' silk merchant in France to be tested.

His correspondent makes returns that he distributed the sample among several of the leading manufacturers in Lyons, all of whom had failed in their efforts to convert it into a thread suitable for weaving—the staple is too short. Mr. Gillet is now endeavoring to so improve the staple of the pod, by careful cultivation, as to render it possible to spin and weave it. He has made no experiments with the fiber of the stem; but says that he shall endeavor to collect sufficient next season to have it thoroughly tested.

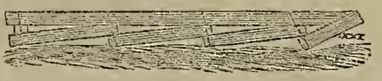
We have a statement before us, from Mr. Alex. Kirkwood, in the Canada *Farmer*, of some three or four years since, that the down of the Canadian milk-weed had then been "manufactured into fabrics of beautiful appearance and texture," and that *paper* had also been made from both the down and fiber.

Flax, after all, is no doubt the safest fiber, after cotton, upon which we can rely at present; as that, in addition to its value as a fiber, also furnishes a seed which, at the present prices, pays for the entire culture. We presume, however, that experiments will be made with the milk-weed until its textile value is fully determined. We shall watch its development with much interest, and report progress as fast as anything noteworthy transpires.

It should be recollected that Mr. Macrae makes no offer, in his circular, of any price to be paid for the "milk weed,"—from which we infer that he is desirous that some one should collect and forward to him or some other person a sufficient quantity to secure for the same a thorough test. That end will no doubt be accomplished by the especial attention which has been called to the matter.

A Good and Cheap Clod-Crusher.

Harrowing, in many instances, will not effectually break up the clods in a plowed field, while the roller, worse still, presses them into the soil. We give herewith, from the *Rural New-Yorker*, a sketch of a clod-crusher much used in many places, which is said to be far more effectual than either. It is made by taking two pieces of 4x4 scantling, about eight or ten feet long, and three pieces of plank, each one foot wide and lapping the latter underneath, as shown in the figure. The scantling should run past the planks in front, a few inches, and after being properly beveled, should be connected by a cross-piece made of plank, also beveled, like the front of a runner or sled. This cross-piece should lap upon the first of the series of planks, as shown. These sections of planks should be securely spiked to their places, and the heads of the spikes carefully sunk into the wood. A ring on each corner, with a chain running through both, so as to form a bite or loop in the center, is the most convenient form for hitching. In order to prevent the forward end from drawing too high, the rings should be placed a few inches back of the extreme front of the drag. A drag of this description will, in many instances, be found much better than any other device employed for breaking up clods or otherwise smoothing over the surface of a plowed field. It rubs the lumps to pieces, instead of burying or pressing them into the soil. The device is extremely simple, and can be readily constructed by any farmer. It is common property—no patent having been asked for it.



Improved Cotton Culture.—With the new order of things at the South, there appears to be a decided disposition to introduce improvements in agriculture. We made a notice, a few weeks since, of the gain in the yield and quality of cotton, by improved culture. Improved varieties are also being introduced, one of which, known as the "Peeler Cotton," is said to be giving much satisfaction. The Georgia *News* says: "It is rapid in its growth, matures early, is very prolific, and the staple is long, silky and strong. It ought to, and probably will, sell for ten or fifteen cents more than the ordinary cotton. It will be largely cultivated in this section next season."

No plant of equal value in the world has been more completely left to take its chances, than cotton; yet there is no reason why careful culture and selection may not do as much for this as for almost any other plant that has been cultivated either for pleasure or profit.

A Hardy Breed of Sheep.—We devote a large space in this issue to an article on the Herdwick breed of sheep, which are about to be introduced into Missouri, and the introduction of which into this State is already a matter of consideration. What has already been said in previous and the present issue of the Press will no doubt prepare such as may feel interested in this matter to look for further facts in this direction, which have been promised us by Prof. Rowlandson.

To Destroy Weevils and other Insects in Grain.—M. Gand, Agricultural Engineer of Belgium, gives his method for destroying the weevil and other insects in grain. His plan is to deposit the grain for seed in barrels fumigated with burning sulphur. Coarse threads of twine are drawn through melted brimstone, suspended in the barrels intended for the grain, and burned there. The seed is then thrown into the casks amid the fume, and covered up for a quarter of an hour, when the operation is complete, and the seed ready for sowing.

Applying Manure to Seed.

The Chinese, who excel all other nations in the economy of agricultural operations, aside from the employment of machinery, seldom sow or plant a crop of any kind without having previously soaked their seeds in a diluted manurial preparation of some kind. They hold that this operation not only gives the plant an early start, but preserves both the seed and plant from worms, bugs and flies. They have made this a common practice for thousands of years, and fully learned its value from experience; while its practice by Europeans and Americans dates back scarcely half a century. The practical results of Chinese agriculture are too important to be spoken of with contempt by even the most advanced American agriculturists of the present day.

Experiments.

It is only within a very few years that any very careful experiments have been made in this direction by either European or American farmers. Some twenty years ago, Mr. Ronald, of Glasgow, commenced a series of such experiments on wheat, which he continued for ten years, and which fully sustained the value of the practice. The chief elementary substances which he employed were lime and water, and solutions of hen manure, city sewage, and soot and water. He also used *sugar* with great advantage, not only as a useful manure, but also on account of its glutinous nature in adhering to the seed and holding there other substances with which it was mixed. His method of coating seed was as follows:

> Take a tub, say thirty inches in diameter and two feet deep; empty into it four bushels of wheat; take four pounds of sugar, bruise any lumps that may be in it, and sprinkle it on the top of the wheat. Take another tub, two feet in diameter and one and a half feet deep; put into it six gallons of water, and mix soot with it until it is as thick as good cream; then, with a jug, distribute the solution slowly on the top of the sugar and wheat. The liquid will then be about two inches above the level of the wheat, and the whole mass is to be stirred several times during the first four hours. After remaining fourteen hours the liquid is entirely absorbed, and the grain is sowed without loss of time.

Soon after Mr. Ronald had finished his experiments, the plan was tried upon oats by a gentleman, who communicated *his* results to the London *Farmer*. The result in this instance was equivalent to an additional yield of six and a half bushels to the acre.

Professor Johnson, Agricultural Professor at the Sheffield Scientific School of Yale College, strongly recommends this practice as one, the advantages of which have been fully proven by numerous experiments.

Use of Blue-stone, Etc.

The practice of steeping wheat in "bluestone" (sulphate of iron), etc., for preventing smut, grub, etc., is now largely practiced both in this State and at the East, and with good results. The idea, however, connected with this practice, that the benefit derived is due to the fact that the chemicals employed prevent attacks upon the seeds by insects, or kill the germs of fungi which harbor them, and which would otherwise enter into the composition of the plant, is quite erroneous; the benefit is solely due to the manurial (stimulating) action of the chemical in securing a vigorous growth to the plant in the earliest stages of its development. Now if other ingredients were added to the "blue stone," such as those employed by Ronald, the benefits would no doubt be still greater at a mere nominal addition to the cost.

The Philosophy of Manuring Seeds.

The plan of causing every seed to carry with it to its bed in the earth some good manure stands to reason; and the fact that saccharine matter is developed in the germinating process, leads naturally to the conclusion that an increased supply of this substance would be beneficial. But even although the scheme were not based on specious principles, or although its actions were incapable of a scientific explanation, that would be no good ground for abandoning experiments or relinquishing all research in that direction. The writer in the London *Farmer*, above alluded to, says:

> In the progress of the growth of the crop, the superiority of the dressed grain is in most cases very marked. In early sown fields, on weak soils, with barren weather, corn yellows in the *swoon*—that is, when the nourishment of the pickle is exhausted. At this stage in the growth of the plant, the benefit of the coating is at once apparent, especially if sugar has been one of the ingredients used in the dressing. The embryo plant otherwise languishes in its first searches after food.
>
> The sight of the sickly plant at this period, under the conditions assumed, as compared with manured seed, would convince the most incredulous that good was to be derived from the scheme. To assert, as some sanguine advocates have done, that, by adopting this process, the farmer may dispense with the ordinary manurial applications, and yet have a large crop, is quite absurd. A grain of alimentary matter in contact with the seed cannot extend its influence through the whole period of the growth of the crop. It can only be rationally viewed as an *auxiliary*, and not as a *substitute*, for ordinary farm-yard manure, or such artificials as are in other circumstances applied to the crop.
>
> The main obstacle to the constant success of the experiments in this direction is an excess of rain before and down to the stage of the growth of the plant to which we refer, by which the ingredients used pass away by solution and filtration at too early a day.

The Rain and the Crops.

The recent rains have been timely, and will constitute much in aid of the growing crops. In some portions of the State the early-sown grain was already languishing for want of moisture. In Tulare county the previous rains had soaked the nutriment out of the old grass, but did not start the new; and the cattle were suffering severely for the lack of feed—some in a famishing condition. Many farmers on the west bank of the San Joaquin had commenced seeding their ground for the second time, as the seed sown in the early part of the season had failed to come up at all.

In every direction where the ground has not been seeded, the plows are active. In the Sacramento Valley, more grain has been sown up to the present time than ever before; probably this is also true of every part of the State, Though the measure of grain has been less than usual up to the present period of the season, it has been sufficient for all requirements so far; and the prospect is good that we may yet come up to a fair average. Still a good, old-fashioned California rain-storm would be of great value to the country at this time—to the miner, as well as to the farmer. The fall thus far has been about 4½ inches in this city, and about 5½ in the neighborhood of Mount Diablo.

Dairy Farming in Monterey County.—The Monterey *Democrat* furnishes the following particulars with reference to the dairy farm of Mr. C. S. Abbott, in that county: "The farm consists of 3,600 acres of land, on which are kept 450 cows. Corn is sown in drills, and beets are cultivated to be used as feed in the winter. It is said that milch cows will rent, to persons who desire to manufacture butter and cheese, for from $25 to $30 per head. At the latter price, the 450 cows would bring an annual revenue of $13,500. It is not necessary, in order to enter upon successful dairy farming, to have so large a tract of land or so many cows. Forty or eighty acres of tolerable land, accessible to market, would make a fine business for a family of moderate expectations. Cows can be kept almost everywhere while vegetation is growing, and the cultivation of root crops, or a little grain, to be fed with hay or straw, will do the whole business."

Herdwick Sheep for the Sierras.

In our issue of September 11th, 1868, we made mention of the fact that parties were making an effort to introduce into Missouri a hardy breed of sheep from the mountains of Navarro, in Spain, which, it was thought, might also be successfully introduced into the mountain regions of this State. That notice brought out a communication from Prof. Thomas Rowlandson, of this city, which appeared in our issue of November 6th, following, in which the Professor suggested that, from the similar characteristics ascribed to the Navarro breed, they might be identical with the "Herdwick sheep," deemed so valuable in the mountainous districts of England, and which the Professor had already recommended to the attention of the residents of the alpine districts of California. He also gave the tradition of the origin of this breed of sheep—that they were supposed to have descended from a flock which escaped from a ship wrecked many years ago on the southern coast of Cumberland.

The Professor has since placed in our hands the tenth volume of the *Journal of the Royal Agricultural Society of England*, published in 1849, in which we find a Prize Essay, written by him, "On the Breeds of Sheep Best Adapted to Different Localities," containing the following additional reference to this interesting breed of sheep:

They were small, active, polled [without horns] and their faces and legs speckled. They evinced a peculiar sagacity in foreseeing the approach of a snow-storm, as it was invariably seen that a little before its coming, they clustered together on the most exposed side of the mountain, where the violence of the wind usually prevented the snow from lodging. This instinct caused them to be regarded with a degree of interest amounting to superstition; and their excellent qualities and adaptation to their new situation became speedily evident; some portions of the fleece were considerably finer than that of the black-faced sheep, whilst the matted quality of the wool enabled them to endure any severity of weather. * * * Great endeavors are now [1849] being made by the farmers in the district named to procure flocks of pure Herdwicks; some of whom have been constantly aiming at this point for upwards of twenty years, and are still under the impression that they have not got their flock to the proper degree of purity of blood; it is is certainly an indirect proof of the great value of this breed for its own peculiar locality, that farmers should strain and devote themselves to a point so apparently simple, but there are difficulties to surmount of no ordinary nature in order to procure a genuine flock, which serves in a like manner to indicate their great worth. These sheep, not being at first properly appreciated, got more or less crossed with the prevailing black-faced breed, and to restore the breed to its original purity is one of the difficulties that a Herdwick flockmaster has to overcome. * * When we see a set of careful farmers, than whom there is not a more thrifty and hard-working body in the United Kingdom, is found thus strenuously and perseveringly bending itself to the one object—the improvement of the breed under consideration—we may rest assured that their superiority over the old black-faced race for elevated districts, is of no ordinary description.

As a proof of the value set upon this breed of sheep, we briefly summarize from the Professor's essay the fact there stated, that ninety-four competitors came forward for the various prizes offered at the Ennerdale Bridge Fair for 1848, varying from the highest, for the best Herdwick tup or buck, down to two dollars, the lowest. Twenty-two prizes were subscribed for by the breeders, and six premiums were given by the Keswich manufacturers—viz: three for the best white-fleeced tup or buck, for which there were twenty-three competitors, and three ditto for the best pair of five white-fleeced ewes; evincing no mean amount of emulation, when it is reflected that this local association existed only for an area of not more than 200 square miles of mountain land, and not above one-fifth of that now occupied almost wholly by this peculiar breed of sheep.

The following are the characteristics of the Herdwicks, as given in the essay above named:

The Herdwicks of the present day are characterized by being polled, and have brownish or speckled black and white or mottled faces; some few have black faces, and also some have horns, but neither of these are considered genuine; they are also known from the circumstance that, as they get older, they assume a white or grey appearance about the nose or legs (in the shepherd's phrase they grow raggy). The ewes should always be polled; on a few wethers and rams small smooth horns make their appearance—a proof of intermixture of blood; the wool is fine, only about the neck and fore-quarters often intermixed with kemps. The wool on the body is open and very kempy, assuming in some instances the appearance of hair, and is only used for the coarsest purposes, such as horse-rugs, etc., and consequently obtains only a low price, notwithstanding which, Herdwick flock-proprietors prefer this sort of fleece to one of better quality, as it is found from experience that stock with coats, as described, withstand the severe winter weather on the bleak mountains which they inhabit much better than sheep with a better fleece. A singular anatomical character is also found amongst many of them, viz: that of having a rib more than any other breed—fourteen instead of thirteen. If "they keep their ground well," as it is locally termed, the ewes are kept as long as they will breed, which is often until they are ten or fifteen years of age, and some few have been known to attain the age of twenty years. The wethers go off at four and a half to five and a half years old, and are generally killed without being placed on any better pasture, being found sufficiently fat off the mountain; in fact, they have been tried on turnips, clover, and other artificial food, without any commensurate advantage, and sometimes with an evident loss of crop and deterioration in the weight of the sheep. When fat, they weigh from ten pounds to twelve pounds per quarter, and are the finest mutton produced in England, assimilating in flavor closely to venison; they also, when at the fattest, possess a larger portion of lean meat than any other sheep; and, when the legs are cured in the same way that pigs' hams are, make a most exquisitely-flavored grill. The ewes are frequently sold to graziers in the vales, and are put to Leicester and Southdown rams; and, if put on good fair land, will fatten a lamb as large as themselves, being excellent mothers and possessing an abundant flow of milk. No hay is given to Herdwicks during the winter; they support themselves in the deepest snow by scratching down to the herbage, and if any part is blown bare they are sure to discover it. The lambs are dropped about the 12th of May, and are well covered with wool when dropped; sometimes the lambs are taken to the lower grounds the first winter. The ewes are not put to the ram until they are two years and a half or three years and a half old. There is a striking peculiarity in connection with the Herdwick sheep, viz: that when once domesticated, as it may be termed, to any particular portion of mountain land, the shepherd is always sure to find them on their proper locality, unlike the black-faced sheep, who are desperate wanderers. This valuable quality in mountain sheep has, however, this disadvantage, that the ewes, if removed from the place where they were reared, will be invariably found to return to their native locality at the lambing season. This renders it almost impossible to procure a flock of Herdwicks except by purchasing lambs, at which early stage of their growth this fixed attachment to the place of their birth may be presumed to be not so strong.

ABOUT SEEDS.—The fact that old seeds yield week plants is taken advantage of by the florist in producing new varieties. It is said that while the one-year-old seeds of Ten-weeks Stock yield single flowers, those which have been kept four years give mostly double flowers. In case of melons, the experience of gardeners goes to show that seeds which have been kept several, even seven years, though less certain to come up, yield plants that give the greatest returns of fruit; while new seeds run excessively to vines.

APPROACHING THE SEA.—It is said that the proposed ship canal near Stockton will place that city within eighty miles of San Francisco, by deep-water communication, and less than four hours' time by means of fast steamers.

The Santa Cruz Farmers' Club.

Deep or Shallow Plowing.

This club held its first regular meeting, on Saturday, Dec. 18th, when the question of deep or shallow plowing was discussed. We learn from the *Sentinel* that the meeting was well attended, and the discussion quite animated. As this subject is of much importance, and as the discussion relates exclusively to California experience and practice, we copy in full so far as reported in the *Sentinel*:

Mr. Alex. Russell was in favor of deep plowing and afterwards using the sub-soil plow; stubble-fields cannot well be plowed too deep. The roots of cereal crops, in dry soil, strike deep, below the plowed surface in dry seasons.

Mr. E. Daken.—In sub-soiled ground he had raised, on terrace-land, 125 sacks of potatoes to the acre; but the same plowing had been a failure for grain. Used the common 13-nch plow, with a 10-inch mould-board plow to furrow and cultivate—when the soil is good, always sub-soil.

Mr. Dana Monteith was in favor of sub-soiling; for that purpose had used only the common plow-share to subsoil for beans; the land was common clay, with alluvial and vegetable mould.

Mr. H. H. Doane said in working down knolls, it requires at least three years to level and cultivate sufficiently to raise good crops.

Mr. M. Kingsley had always plowed deep, and found that the deeper he cultivated the better was the crop; had plowed twelve inches deep, and raised forty bushels of wheat to the acre. Again, in lighter soil, the same plowing had a crop of only twelve bushels to the acre. Had plowed four inches, deep in good soil, with a dry season, and the result was ten bushels to the acre.

Mr. J. S. Mattison.—Had plowed nine inches deep and had forty-five bushels of wheat to the acre; the following year, from the same cultivation, had only twenty bushels to the acre. In sub-soiling, the heavy rains packed the soil, and the water stood on the surface instead of entering the ground. (Mr. Russell explained, by saying that he did not propose running the sub-soil plow on the surface, but about six inches deep in the regular furrow). Deep plowing was best for drainage, as the water settles below the roots of the grain or runs off by under-drainage. Sub-soiling is most effective for drainage, when the ridge-furrows are shallow and the border furrows very deep.

Mr Monteith had used four yoke of cattle, plowing new upland soil six inches deep, and had a crop of from fifty to sixty bushels of wheat to the acre. The surface was clay-gravelly, with a blue-clay subsoil.

Mr. E. Daken believed shallow plowing, generally, was a failure. He had plowed ten inches deep, which experience had proved the best. His land had averaged four tons of cereal hay to the acre. His plan was to plow deep and round the lands up so as to self-drain. This is necessary on a dead level plateau, such as found adjacent to the sea-shore. When he first commenced plowing, the ground was so hard he could not strike a pick into it, even after the fall rains; now he could plow any of his land before the first rains.

Mr. V. Humphrey inquired of Mr. Daken "how many years have you pursued this plan?" Ans. "Seven years." "Well, then you had a slope of nearly seven feet for under-drainage?" "No," said Mr. D., "the cross-harrowing partially fills up the furrows and decreases the incline of the slope, so I find that the mower acts well and cuts the grain off perfectly smooth from the ridges; although the ground seems uneven, on inspection, it is found practicable to mow it as well as level land."

Mr. V. Humphrey thought that 10 or 12-inch plowing was too deep, in the average soil; it makes a mortar-bed of the land; he was opposed, from reason, theory and practice, to deep plowing, because the soil is too porous. Plowed six inches deep the second year, for oats; the first year plowed from ten to twelve inches deep—this refers to land which requires drainage—considered six inches shallow plowing. The roots of plants will not penetrate below the plowed level, if a field is cultivated at an uniform depth and a crust is permitted to form.

Martin Kinsly said he had this year raised twelve acres of corn, which yielded fifty bushels to the acre—had plowed the field twelve inches deep.

Mr. Humphrey replied he could only speak of his own land or such as he had cultivated himself.

How to Feed a Tree.

It is a mistake to suppose that digging and manuring a few inches or a foot around the body of a tree does it any material good, except in the case of one very young. The roots of a full-grown apple tree receive their nourishment about ten or twelve feet away from the trunk. The larger roots nearer the trunk are simply great arteries, which convey to the trunk the nourishment which has been taken up by the smaller roots at their extremities. Of the thousands of hungry mouths of a full-grown tree, but a mere moiety are found until you reach a point under the extreme limit of the most wide-reaching branches. Hence, the tree should have the bulk of its moisture and nourishment placed at some little distance from its trunk.

True, if you are regardless or ignorant of the habits of a tree, and persist for a long time in placing its food close by the trunk, nature, rather than allow the tree to be starved out, will reverse her order, and send out a new net-work of spongioles, with their little mouths, from the trunks, instead of from the opposite extremity of the roots, in order to reach the misplaced food. When you feed a fruit-bearing tree, place the food near its mouths, which are from five to ten feet from the trunk, according to its size and age. Would you place a bag of oats on a horse's back to feed him?

SUGAR FROM BEETS IN CALIFORNIA.—According to the report of the parties directly interested, the result of the late tests in the manufacture of sugar from beets in Sacramento, have fully solved all doubts as to its practicability and economy. It is now stated that the company will enter largely into the business during the coming summer. If the business is once successfully established, it must increase rapidly, and add largely to the home productions of the State. According to the Sacramento *Bee*, parties connected with the beet sugar factory at Fond du Lac, Wisconsin, associated with others in this city, have recently purchased 100 acres of land in Alameda county, which they will lay down to sugar beets this year, and will erect a sugarie on the premises. The successful test made at Sacramento has created an interest in this matter, and it is likely that even this year several sugaries may be erected in the State.

Now that the ramie cultivation is beginning to excite so much attention. Parties are moving in the matter of utilizing the so-called "California milk-weed.

ALPINE COUNTY MINES.—Mr. Lewis Chalmers, of Bulliona, Alpine Co., writes us the following items: "The Imperial tunnel is now in 1,320 feet. Time occupied, 22 months, 235 feet from the perpendicular of the famous Florence ledge. Tunnel face indicates proximity to ledge matter. Have succeeded in forming an influential company in London to develop Buckeye No. 2, in the county. (The Exchequer G. and S. M. Co., Capital, $300,000). Board: the Earl Poulett, the Earl of Buchan, Lord South, S. King Church and H. Syme Esqs. Can get ore from the present tunnel assaying $100 to $540 per ton; antimonial sulphide chiefly. Shall commence work immediately." [The mineral sent will be described with others next week.]

* * *

TO FARMERS AND LAND HOLDERS.—Do you wish to sell your farm, or do you wish to dispose of one or more sections of your extensive landed possessions? If you do, you can sooner find customers by advertising in the SCIENTIFIC PRESS, which has a large circulation among the miners in every part of the State, who, at the present time, are the largest buyers of lands, for farming purposes, of any class of people in the State. Sellers should remember that it is a hard matter to dispose of property when nobody knows you wish to sell.

* * *

WHEAT SHIPMENTS FROM VALLEJO.—Twenty-two ships have loaded with wheat at Vallejo since July 1st., which have received cargoes aggregating $1,188,198 in value. Ships in going to that port to load have [to first take on board a portion of their cargo at this city, as ballast, to enable them to cross the bay safely—from 100 to 400 tons, according to the size of the ship. This amount of ballast, we presume, is to be deducted from the above aggregate of value.

* * *

THE LIGHTNING PRESS.—The first newspaper which was ever printed on an eight-cylinder lightning press in California, was the Thursday evening edition of the San Francisco *Bulletin*. We congratulate our neighbors on their enterprise, and hope that the activity of their brains may continue to keep pace with the activity of their new press.

Friendly Criticism.

Americans generally, and those of the Pacific coast especially, one might almost say, are peculiarly sensitive to outside criticism, and resent quickly any statement they consider in the least derogatory, although it may be true, if published by a stranger. Here in San Francisco, for instance, a storm of indignation is easily raised by any article which criticizes us, if printed or circulated at the East; while on the other hand, we laughingly accede to the remarks made in the *News Letter*, which at times reflect pretty severely on our failings.

The residents of mining regions seem especially alive to any statements which are made about them. Let an intelligent man visit any mining region, and publish a candid opinion of its advantages, and its short-comings, and the papers of that vicinity, overlooking his praise, immediately assail vehemently the critical remarks, and too often demean themselves by personal attacks on the unlucky writer. This is verified every year by actual occurrences.

To defend ourselves is natural, and to be always prompt to vindicate the reputation of one's city, district or country, is eminently praiseworthy, if conducted within proper limits. But to go to extremes, and to transgress the bounds of truth in such a case, is merely stultifying, and is raising a bar to our progress. We ought to be ready to acknowledge humbly our faults, and to profit by their being pointed out; not to deny them when they actually exist.

The practice of attacking any writer who ventures to speak candidly about a place, is resulting in a great measure in depriving us of correct information with regard to other localities; for a good-natured, easy-going person will show nothing but the best side. Who, for instance, can form any *correct* idea of California from Todd's book, lately published, or of the western countries from Bowles' very interesting but highly-colored narratives? Very old-fashioned and out of date is Burns' prayer getting to be: "O wad some power the giftie gie us, to see oursels as others see us! It wad frae monie a blunder free us, and foolish notion."

Our thoughts have been led in this direction by some remarks in Mr. Paul's letter on the Mines and Mills of Colorado, which we publish in another column. Mr. Paul is a gentleman of the most varied experience, and, as it seems to us, of a disposition to look at a country with impartial eyes. We would, therefore, call attention to his remarks, that he does not utterly condemn a place because he finds some faults in it, and that, on the other hand, Californians should not despise the land because such faults are commented on. We desire and expect further communications from Mr. P., and believe that they will be written with candor, but, as is expressly stated, with "Californian eyes."

Colorado is a most promising young Territory, with the brightest of mining prospects, as Mr. Raymond asserts, and as our own experiences there lead us to believe. It has had many drawbacks, however, the wild speculations of '64 having done an incalculable amount of damage. The mill-men in many places have too blindly followed the lead of others, and thus subjected themselves to unnecessary loss; in many places, we say, not in all. Crowds of so-called "scientific" men, with no science except that of drawing money from the pockets of others, have caused foolish expense, and brought discredit on the profession. But from what we have heard and seen this last year, we believe that a change is taking place, and that great advances have been and are being made, advances which Californians ought to watch attentively. Our remembrances of the country are very pleasant, for besides the bright hopes we were led to form of the prospects, we think fondly of [the unparalleled hospitality we received, although a stranger and unknown. And this pleasant memory alone would cause us to refrain from damning with indiscriminate praise.

* * *

Railroad Progress.

The present year promises to be even a more important one for railroad progress on this coast than the one just closed. It certainly opens well. The Oregon road is being pushed forward with the energy always characteristic of the managers of the Pacific Central. Rails and ties for this road are being rapidly forwarded along the line of work. The same company has also laid out and commenced work on the San Joaquin Valley road, which starts for the line of the San Francisco and Stockton road near Mossdale.

The Placerville and Sacramento Valley Railroad Co. have reorganized in a manner which looks like business—the effort being to effect an arrangement by which the Vallejo road may throw out a branch to Placerville.

The project of connecting the Salinas valley with the railroad system of the State is fast taking a practical shape. The latest reports from that direction connect Mr. Holliday's name with that enterprise. The citizens of Monterey county should do all in their power to encourage capitalists in such an undertaking.

Nevada and Grass Valley appear to be moving in earnest to secure a railroad connection with tide water. The importance of the quartz mining interest centering in those localities, calls loudly for such facilities. A connection via Marysville seems to be just now the favorite idea. Engineers have already been engaged to make the preliminary survey. The Vallejo and Marysville Railroad Company seem to be at the bottom of the movement, the object with this as well as with the Placerville road being to bring business to their main road.

The Suisun and Berryessa road is already in process of being graded, and there is a fair probability that the projected road up the Sacramento valley, west of the river, will soon be a fixed fact.

The first 20-mile section of the Oregon end of the road to connect that State with California is just about, if not already, completed.

* * *

AN INTERESTING legal decision has lately been made. A steamboat owner on the San Joaquin river made a written contract with a farmer to transport a certain lot of wheat at $3 per ton. The farmer failed to deliver the wheat according to contract, and was sued for the whole sum to which the contract would have amounted. The defendant proved that the plaintiff could get all the freight he wanted as long as the water was sufficiently deep for the passage of the boat, and that the plaintiff had freight for part of the season at $2.50 per ton, for shorter distances. The Court held that the plaintiff could recover only the actual pecuniary loss which he incurred, and that he could be considered to have suffered no damage, if he could get as much or more from others; that a carrier cannot refuse to work and claim full wages for his time in such a case.

* * *

THE SAN BERNARDINO TIN DISCOVERY. It is said that the discoverers of the reported tin deposits in Sweetwater Cañon, some 40 miles north of San Bernardino, are jubilant over their prospects. There is said to be a well-defined tin-bearing ledge, from which ore [specimens?] has been taken, assaying 30 per cent. of tin. There is very good reason to believe tin will, ere long, become one of the important mineral productions of California.

Silver has also been discovered near Camp Cady, on the Fort Mohave road, about half-way between San Bernardino and the Colorado river.

New Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING DECEMBER 28TH.

PROPELLING APPARATUS.—E. Averill, Sacramento, Cal.

PISTON AND PISTON-PACKING.—O. Collier, Sacramento, Cal.

BALL-AND-SOCKET JOINT.—Randolph Raby Craig and Joseph Craig, Nevada, Cal.

HYDRAULIC NOZZLE.—Aaron Harris, La Porte, Cal.

BRAKE FOR CARRIAGES.—Benj. F. Leet, Dayton, Nevada.

GANG-PLOW.—Emerson E. Gore, Phœnix, Oregon.

SALVE.—William W. Ogleshey, Benton Oregon.

MACHINE FOR BORING BLIND-STILES.—Albert M. Winn, Jefferson Kindleberger, and William Augustus Arnold, San Francisco, assignors to "The Inventors' Association," same place.

HARVESTER-CUTTER.—Frederick Wittram, San Francisco.

REISSUE.

CARBURETTING AIR FOR THE PRODUCTION OF LIGHT AND HEAT.—Blakey Pilkington, Oakland, Cal., assignee, by mesne assignments, of James D. Jenkins. Antedated January 28th, 1868.

* * *

Notices of Recent Patents.

Among the interesting and important patents recently issued to Pacific coast inventors, the following are worthy of mention:

MACHINE FOR BORING BLIND-STILES.—A. M. Winn, J. Kindleberger and W. A. Arnold.—In the old way of boring the holes one by one much time was necessarily consumed. This machine is then a great advance, as by it all the holes in one stile are bored at one operation. It, moreover, has a spacer by means of which the distance between the holes to be bored is rapidly adjusted at will, after the size of the blind has been decided upon. It consists of a frame which has two pulleys at each end. The augers for boring the stiles are driven by tranverse rollers, in the center of one end of which they are fastened. There are two sets of rollers, one above the other, so arranged that those in the upper set stand over the spaces between those of the lower. These rollers are driven by a belt, passing from one of the above-mentioned pulleys to the other, and extending between them, the upper surface of the belt driving the upper, and the lower surface the lower set. A table for holding the stiles extends along the front of the machine, and is operated by a cam in such a way that it presents the stile first to one set of augurs, by which the alternate holes are bored, and then to the other set, which bores the remainder. The whole machine is very neat, and the simplicity of the arrangement is evident at a glance. This patent, and several other valuable inventions by Kindleberger & Arnold, have been assigned to the San Francisco Inventors' Association. K. & A. were awarded a gold medal for their inventions exhibited at the last Mechanics' Fair.

MACHINE FOR UPSETTING BANDS OR TIRES.—Albert S. Hart, S. F.—This apparatus is for the purpose of shrinking or upsetting the tires of wheels, or more particularly small bands. It consists in providing the jaws, which retain the band or tire, with a projecting head, so that, when the band is keyed to the machine, the wedge will have an equal bearing the entire width of the band (or tire). The wedges themselves are so arranged in a slot in the jaws, that, as they are withdrawn, they are gradually raised, so as to free the band and present no obstacle to the ready introduction of the next heated tire. Attached to the fixed jaw is a projection, which fits in a suitable opening in the movable jaw, when they are closed, and which prevents the band from buckling or bending down during the process of shrinking. The heads are placed far enough apart to admit the stroke of a hammer, should the band bend upward during the strain. The apparatus particularly facilitates the introduction of a band immediately after it is heated—an important feature, as bands cool very quickly, owing to the thinness of the material of which they are made.

The Coal Fields of Southern Russia.

As we naturally are interested in those matters in which we are directly concerned, and as our western coal workings are every day assuming larger proportions, and are sure to play a most prominent part in the development of our country, we think it will be interesting to our readers to hear of some very important researches lately made with regard to the coal mines in a far distant part of the world.

The Deposits of Anthracite.

As yet known, have been confined principally to districts in Pennsylvania. Rhode Island has produced limited amounts; France and Wales, comparatively small quantities; while the beds in Russia have hitherto been known only as existing to the world in general. B. von Cotta, Professor of Geology at Freiberg, has, however, lately visited the Russian mines, and gives some very interesting particulars with regard to the fuel deposits.

Position and Extent of the Beds.

In the southern part of Russia, in the Don Cossack country, there is a coal formation which extends, on the surface, north of the river Don and of the Sea of Azov, some thirty geographical miles in length, and eight to ten miles in width. The formation is bounded on the west by elder crystalline slates, covered on all sides by newer formations, under whose horizontal strata, however, beyond the boundaries of the principal coal district, inclined or tilted strata of the coal formation come to the surface at several places, indicating a much greater subterranean extension. From examinations of these stratifications, it would appear that the coal measures have a tremendous thickness of about one-half geographical mile. Of course, the deepest parts cannot be mined, but those which can be reached will afford supplies large enough to last a long time.

Appearance of the Country.

The surface of the whole district is gently undulating and devoid of trees. The generally uniformity is interrupted only by thousands of mounds or tumuli, ten to twenty feet high, which occur everywhere, singly or in groups of two to five. Similar mounds exist over all Southern Russsia, in Germany, Hungary, Southern France, Spain, Portugal and Northern Africa.

The Rocks.

Consist of alternating clay slates and gray sandstones, with intervening strata of limestone and beds of anthracite one-fourth to four feet thick. The place of the last is taken in the northwest, however, by beds of bituminous coal. Small amounts of sphærosiderite or carbonate of iron occur, enough, however, to give grounds for believing that careful prospecting will show sufficient for an extensive development of the iron industry.

Geological [Puzzles.

It is a remarkable fact that in this sedimentary region there is an oft-repeated alternation—running into the thirties—of limestone strata, which are entirely of *marine* origin, and slates and sandstones, which hold only remains of *land plants*, and that, moreover, these land plants denote a *more recent* origin than the intervening marine limestones. It would appear from this that here, during the coal period, not only was there a frequent alternation of sea and swamp land (sinking and rising of the surface), but also that, under these circumstances, no definite limits in time can be drawn between the carbonaceous limestone formations and the coal measures.

It is, moreover, very remarkable that all the coal in the southern parts of the region of the Donetz river is the finest quality of anthracite, while in the northwestern parts it is still bituminous coal, and that, too, without any apparent geological cause; for eruptive rocks, which would have an influence on the character of the coal, are entirely wanting. Further north, some seventy geographical miles, near Tula, there is coal of the same age, which is, in fact, partly in the condition of brown coal (lignite), and which holds considerable amounts of honey-stone. It appears, then, from this, that the condition of coal-beds—the degree in which they are changed—does not depend exactly on their age.

Quality of the Coal.

The anthracite of the Donetz district is in part so pure and so compact that small ornamental articles can be made out of it. In Novo-Tscherkast (the capital of the Don Cossacks country) the Professor saw a vase some three feet high, and a casket more than one foot long, which had been made out of the coal, as a present for the successor to the throne and his spouse.

Government Titles to Mines.—A patent has recently been issued to J. N. Aiken, for the Virginia quartz claims at Coulterville, Mariposa county. This, says the *Independent*, is only the third which has as yet been issued and recived in the U. S. Land Office for the Stockton District. We believe that very few applications for titles have as yet been made in any part of this State. Miners are evidently holding back in expectation of some change being introduced into the law for securing such titles, from which they hope to profit more than they can from the present law. We believe the same is also true of the mines near Virginia City.

We see it stated, however, that many of the leading companies on Treasure Hill, White Pine, are moving in the matter of securing government titles to their claims. The Eberhardt, South Aurora, Aurora Consolidated, and Iceberg, have all made the necessary surveys to that end, and many others are soon to take the same steps.

The State Agricultural Society.

The annual meeting of the State Agricultural Society for the election of officers, will be held on the 26th of this month. We are pleased to note that the Society is entirely out of debt, with some money in the treasury. We also fully endorse the following from the Oakland *News:*

Now, if ever, the society should turn over a new leaf, and give more attention to the legitimate purpose of the organization. In view of the very extensive Fairs given under the auspices of the Mechanics' Institute, of San Francisco, for the exhibition and promotion of all kinds of manufactures, we think the Agricultural Society might consistently give less attention to that interest and more to farm production The improvement of live stock ought to be encouraged, but speed in horses should not be fostered above all other merits in the list of domestic animals. Speed in a horse is more a luxury than a necessity, and Agricultural Societies should not be chiefly kept up to improve a species of luxury that few can induge in—except "in their eye"—and in that case it is a question whether such exhibitions have a higher moral tendency than a faro bank. The excuse for making racing a specialty has been, that in no other way could an attendance be secured whereby the Fair could be made a financial success. If this be really true, then it is perfectly useless to hold fairs, and the quicker the State withdraws its aid, and the few men properly interested in hogs, cattle, sheep and the various productions of the soil, cease to countenance them, the better for agriculture.

A Fine Specimen of ore from Colorado is thus described by the *Register:* The piece is about the size of a man's hand, and one side is covered with crystals of quartz one-fourth to three-fourths of an inch in length, with fine crystals of iron pyrites dotted in among them, and the whole woven together with a network of fine, bright gold in delicate wires. Some of the iron crystals are covered with a thin coating of white, drusy quartz with minute crystals of gold over the surface, and others have fine wires of gold attached immediately to the iron. Many of the wires of gold also have minute crystals of quartz attached to them.

Our Home Industries.

Barrel-Making by Machinery.

Did you ever reflect how ingeniously and neatly constructed an article a barrel is? How nicely adapted is its shape, combining strength and lightness, the arched arrangement of its staves resisting pressure from without, the encircling hoops securing it from pressure from within! How convenient is its form for transportation, admitting of the vessels being rolled, or rapidly swung by means of hooks placed under the edges of the staves! It must have taken considerable talent to have constructed the first barrel. Ingenious as they have the reputation of being in general, the Chinese are said never to have made one of these articles.

There is a considerable amount of work to be expended on the wood before the complete barrel is formed. The staves must be cut or sawn to the required size, the edges beveled, the ends properly shaped, the grooves made, the heads rightly formed, etc. All this takes considerable time if done by hand. But the irrepressible Yankee, who invents time- and labor-saving machines, has not neglected the barrel, as you may see any day by going out to the Potrero to

The Pacific Barrel and Keg Factory.

Here are barrels and casks, or their separate parts, in quantities sufficient, one would think, to supply the whole coast for a long time; yet the work seems to go on continuously week after week and month after month, with a capacity of producing some 16,000 to 20,000 barrel staves daily. Taking sixteen staves as the number requisite for a barrel of the ordinary size, we have then at least 1,000 barrels daily. What an amount of liquids and solids we must indulge in to keep this one factory going!

The Wood.

Cotton wood for sugar and flour barrels; oak and fir for liquors, vinegar, etc.; sugar pine for the refineries, and various other woods from Humboldt Bay, the Sierra Nevada, Puget Sound and various parts of the coast, are brought in blocks and logs to the wharf. These are cut to the proper size, ready for the following processes:

Steaming and Cutting.

The wood for "slack work"—*i. e.*, for barrels where it is not requisite to have the staves so nicely joined as to prevent leakage—is put into a large tank, and subjected for some time to the action of steam. Having been brought to the proper state, the blocks are carried to a curved knife, which rapidly slices off the individual staves, giving them the requisite transverse curve. With this knife a skilled workman can cut some 80 to 100 staves every minute.

If the barrels are to be perfectly water-tight, the wood is not steamed, and, therefore, cannot be so readily cut in this way with a knife. So the blocks for tight-work are sawn into the proper shape by means of circular saws.

Rolling, Beveling, Etc.

When it is desired, the staves are bent longitudinally to the right curve, thus saving considerable labor in setting them up to make the barrel or cask. For this purpose, after the treatment previously described, the staves are carried up stairs in an endless chain, through a steam-chamber, and deposited near a rolling machine. This catches the staves, and passes them through a series of rollers so constructed that the staves now have both curves—transverse and longitudinal.

They are now set up, one by one, on end in a frame, which holds the stave securely in its proper bend; by swinging this around to one side against cutters fixed in a revolving wheel, one end is jointed to its right bevel; swinging it around to the other side, the other edge is served in the same way—the chamfering of the ends and sawing them off being done by cutters at the same time. Some twenty staves can be shaped thus in one minute.

Cutting Out the Heads.

Our staves are now complete—except grooving, which most coopers, who buy the staves from the factory, prefer to do themselves. We have the heads still to shape. The wood is cut by saws to the right thickness and about the right length. The number of pieces necessary are put in a frame, which holds them fast, and, revolving, subjects them to the action of two circular saws, placed at such angles that the proper edges are cut and the circular head thus made in one operation.

Our staves and heads are now ready to be set up into barrels or casks of any size; for these machines, which we have seen, are adjustable, and will prepare whatever is necessary. The majority of the staves are sold to coopers, who do the rest of the work requisite to produce a marketable article. The factory will, however, make the barrel or cask complete, if desired, and, in fact, keeps a number of coopers constantly employed.

By our new machines and improved processes we are every day getting further from the poetical and nearer to the purely practical. When we have a mechanical apparatus for setting up the staves and fully completing the barrel, the good, slow, old days of the cooper's song will have passed away; but the world will be the gainer.

More About the California Milk-Weed.—Since the article on this subject, in another column, went to press, we have received a later number of the Nevada *Transcript*, in which Mr. Gillett says he has just learned from a work on silk, published 30 years ago, that flannels, superior to English, have been obtained from the silk of this weed, treated in the following manner: The pod is gathered when ripe, dried and separated from the seed. On account of its lightness, it has to be subjected to the action of steam, and mixed with cotton, to give it a sufficient body for carding. It dyes readily, and can be spun and woven, or used instead of cotton as a padding for garments. It has been used in the manufacture of certain East India and China cloths.

A correspondent of the Monterey *Republican* says the plant is now known to botanists as *Asclepias* "*Cornuti*," instead of "*Syriaca*," for the reason that the latter term indicates it to be a native of Syria, where it is never found.

Fish Culture.—A Sacramentan, according to the *Bee*, has received by rail from the East a large quantity of fish spawn, consisting of white fish, salmon trout, speckled brook trout, fresh-water herring and shiners, which will be deposited in some of the lakes on the Sierras, where such fish are not found. If this spawn quickens into life, more and other varieties will follow, until all our mountain lakes are stocked with every possible variety of fish. This work is being done gratuitously by a gentleman piscatorially inclined.

Culver & Lewis, model makers and machinists, have opened a shop at No. 20 Fremont street, where they are prepared to accommodate inventors with careful work, and assist in perfecting the devices of those who may not have their plans entirely completed. Mr. Culver has had experience in this line of business.

A Valuable Present.—What more useful present could be made to the "folks at home" than a year's subscription to the Scientific Press? It will save much letter writing, and will convey, from week to week, a better idea of what is going on in California, of general interest, than any other paper published in the State.

Dr. Livingstone.

John Kirk, English Consul at Zanzibar, received on Sept. 7th a letter from Dr. Livingstone, dated "July 8th, near Lake Bangweolo." He has found what he believes the sources of the Nile, between 10° and 12° south,—or nearly in the position assigned to them by Ptolemy. We quote a part of the letter: "It is not one source from a lake, but upwards of twenty of them. Lake Liemba, which possibly is an arm of Tanganyika, has four rivers flowing into it. One I measured, and found it to be 29½ feet, say 100 yards wide, and waist deep, and flowing fast in September. No rain had fallen since the 12th of May; elsewhere it almost requires canoes. This has eleven good-sized 'buons' flowing into it. Taking these four rivers as one line of drainage (a fifth from Marengo must be added), then the Chambezi flows from the side into one center of the great valley and receives there streams as large as the Isis at Oxford, or Avon at Hamilton. Chambezi enters Bangweolo Lake and receives two streams, then changes its name to Luapula, and, flowing north, receives two streams about fifty yards each. Luapula receives one and enters Moero Lake to receive five streams; one is eighty yards broad and always requires canoes; on leaving Moero it is called Luababa, which receives two good-sized streams, and it forms Ulenge, either a lake with many islands or a division with many streams, which are taken up by the Bufira, a large river, which by five branches drains the west side of the great valley, which probably is that of the Nile.

I have still to follow down the Luababa and see whether, as the natives assert, it passes Tanganyika to the west, or enters it and finds an exit by the river called Locinda into Lake Chowambe, which I conjecture to be that discovered by Mr. Baker."

CHINESE SURVEYING.—M. Skatchkoff, a Russian, who has been a resident in China, recently published in St. Petersburg a small volume upon "Chinese Rural Economy," from which *The Engineer* gives the following description of the method of leveling employed by the Chiness surveyor:

"The instrument employed is a modification of the water-level—an oblong trough of buckthorn or other similar wood, clamped with iron, and open at the ends. The interior surfaces of the sides are ruled horizontally with fine parallel lines in red or black paint, to serve as guides to the observer's eye. The trough is suspended by a single cord from a hook fastened beneath the apex of a wooden tripod stand. The usual height of the latter is 4½ feet. The instrument is adjusted by pouring water into the trough—which is deeper in the center than at the extremities—and then shifting the suspending cord or the legs of the tripod until the surface of the water coincides with a pair of the horizontal lines. With this level, and with the measuring-line and pins before described, all the requisite "field work" is readily and effectually if not very expeditiously performed."

TURRET SHIPS FOR THE ENGLISH NAVY. The English, after much delay, and a vast expense in experimenting upon other plans, have finally adopted the American turret system for their iron-clads. The keel of the first ship of this build, which is intended to be typical of the first-class British war ships of the future, has recently been laid at Portsmouth, and a second is to follow immediately. They are to be constructed on the genuine turret principle, without any attempt to unite, by the addition of masts and sails, the characteristics of two distinct classes of fighting ships.

A REMARKABLE FACT.—The Carson *Appeal*, of December 23d, has the following: It is a very singular fact, and one which is well worth the study of scientific men, that the body of no person that has been drowned in Lake Tahoe has ever come to the surface. No appearance of the three men who were drowned there a few days since has been discovered, and we learn that it is in contemplation to attempt their resurrection by the discharge of Giant powder into the waters near where they are supposed to have gone down—something upon the old principle of firing cannon over the place where dead bodies lie buried by water, to make them rise.

PHYSICAL CONSTITUTION OF THE SUN.—"Frankland and Lockyer remark that the facts observed lead to important modifications of the received theory of the physical constitution of the sun—that proposed by Kirchhoff. According to this theory, the photosphere is either solid or liquid, and is surrounded by an atmosphere composed of the gases and vapors of the substances incandescent in the photosphere. Instead of this we find that the outer atmosphere consists mainly of hydrogen, and that the photosphere is cloudy, or gaseous, or both. Thus it has been shown that a gaseous condition of the photosphere is consistent with its continuous spectrum; that the spectrum of the photosphere contains bright lines when the limb is observed, indicating an outer gaseous shell; that a sun spot is a region of greater absorption, and that occasionally photospheric matter appears to be injected into the chromosphere."—*American Journal of Science and Arts for November.*

THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

CAUTION AGAINST FRAUD.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-1yeow

Metallurgy.

MOSHEIMER'S
Pioneer Mining School
—AND—
METALLURGIC WORKS.
ESTABLISHED........................1858.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of
Chemistry, Assaying and Metallurgy,
That I am prepared to teach all the above branches in less time than in any European School.
I also undertake to work any kind of ore, or mineral substances.
Special attention I would call to all parties who have the so-called rebellious ores, that I undertake the construction of any kind of Smelting, Chlorination, Amalgamating, Refining, or Manufacturing Works.
I refer not to single persons, but to all the works which I build in the States of Nevada and California, all of which are in successful operation.
For terms, apply to JOS. MOSHEIMER,
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 16v19-3m.

Metallurgical.

The undersigned respectfully announce to the public (especially to parties interested in mining) that they have opened an office at
No. 36 FREMONT STREET,
And WORKS at H. J. BOOTH & CO'S FOUNDRY, north-east corner First and Mission streets, San Francisco, where Ores in small or large quantities of all kinds can be worked by Pan Amalgamation, Chlorination or Smelting, and all kinds of Assays and Analyses made. We will also sample any Ores entrusted to our care; and in all cases returns made in the shortest time possible. We will give consultations on the best methods of successfully working Sulphurets or Refractory Ore.
Drawings Furnished for Quartz Mills, Smelting and Chlorination Furnaces.
By having had long practical experience in working Gold, Silver, Copper and Lead Ores, we hope thereby to get a share of the patronage of the mining public.
☞ Mines Examined and Reports made.

Important to Californians.

The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods cheaply, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

The plant has no enemies; mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $25 per hundred; 20 per cent. off to the trade. Address,

Oil Cake Meal.

THE BEST FEED KNOWN
For Live Stock.

We desire to call attention to OIL CAKE MEAL, which we are now manufacturing. No description of feed so greatly promotes the health of animals as Oil Cake Meal, and we urgently request all engaged in the dairy business, raising and fattening stock, or wool growing, to give it a trial, feeling confident that they will find it of very great value. By those who have used it thoroughly, ONE pound is pronounced to be equal to two pounds of Corn Meal; and in the U. S. Government Report of the Department of Agriculture for 1865 it stands in the following relation to other feeds as to the percentage of flesh produced from a hundred pounds of feed, viz.: Indian Corn Meal, 11 pr. ct.; Barley Meal, 13 pr. ct.; Oat Meal, 18 pr. ct.; Oil Cake Meal, 22 2-100 pr. ct. For life-sustaining properties for all stock exposed to sudden changes of weather or over-driving it has no equal,

FOR MILCH COWS it is particularly valuable, increasing the quantity of milk and improving its quality to a far greater extent than any other feed known. A suitable quantity for them at the commencement is one quart in the morning and one quart at night, either alone or mixed with any other food; generally mixed with the mash of bran, slops, roots, or cut feed of any kind. It will improve it to soak it for six or eight hours, the effect being to increase its bulk two or three times. The quantity can be increased gradually, according to the effect produced—ordinarily not exceeding three or four quarts per day.

FOR BEEF CATTLE it has fattening properties which cannot be found in any other feed—the beef always being more tender and juicy and of much finer quality than when fattened on any other feed; and no feed known will so quickly prepare animals for market as Oil Cake Meal.

FOR HORSES a small quantity given daily promotes their health, and is especially valuable for them when chilled or injured from over-driving. It is one of the best remedies known for Horses subject to the Heaves or Rheumatism, and greatly increases the cleanliness, evenness and glossiness of the hair.

FOR SHEEP there is no article of feed known that produces such fine mutton or so promotes the growth of wool. A small quantity given to chilled Cattle or Sheep will keep them alive and greatly increase their warmth and vitality.

At present price ($28 per ton) it is the cheapest feed in market. It is now selling in New York at $42 per ton, gold; at $50 per ton in England, where it has been proven for a long time to be in every respect the most profitable feed known for stock of all kinds—one ton being fully equal to three tons of bran.

The increasing demand for this meal from those on this coast by whom it has been thoroughly tested has induced us to increase our facilities for its manufacture, and we are now fully prepared to furnish it in quantities as may be desired. For sale by the Grain and Feed dealers, and at the manufactory, King street, near Third All orders will receive prompt attention. Address—

THE BEST PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's

Patent Steam PUMP

It is simple, compact and powerful, needs no expert to run it, and will start at any point. Is warranted positive under all circumstances. Send for a circular.

BERRY & PLACE, 112 and 114 California st., San Francisco.

Reading for the Hour.

Something About the Winds.

The atmosphere under the tropics is more intensely heated than it is in the temperate zones. The heated air rises and the cold air rushes in from the north and south to take its place. Thus in each hemisphere two aerial currents are formed—one near the earth's surface, of cold air tending towards the equator, one higher up, of warmer air tending towards the poles. Several causes, however, combine to prevent their blowing due north and south.

Trade Winds.

In the first place, on account of the rotation of the globe, the mass of air moving towards the equator is constantly arriving at a point on the earth's surface, which is moving more rapidly towards the east than the point the air has just left. As the mass cannot instantaneously acquire the increased velocity, it is left a little behind—a little to the west—at every step. Hence, the lower currents, as they approach the equator, bend continually towards the west, and the two currents—one from the north, and the other from the south—meeting at the equator, combine to produce the trade wind, which in the Pacific Ocean blows constantly from east to west, and would blow regularly in this direction around the globe, if no continents intervened.

Irregular Winds of Temperate Climes.

The upper currents are, of course, affected by the earth's rotation, as they pass towards the poles, in the reverse direction. As they, however, approach the north and get cooler, they sink, and when they meet the lower currents coming south, a strife for the mastery ensues, and this is a chief cause of the irregularity of the winds of the temperate climates.

Land and Sea Breezes.

The land is heated more by the sun's rays than the sea, and cools more rapidly when the sun's heat is withdrawn. Hence, on an island in a warm climate, there is in the daytime a current of warm air rising from the surface of the ground, and of cooled air flowing in on all sides from the ocean, while after sundown the current is reversed. This causes the well known daily alternation of land and sea breezes.

Monsoons.

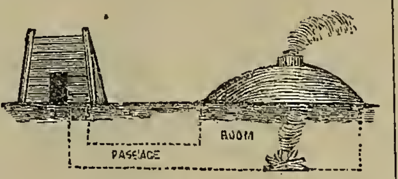
A similar action between continents and oceans are produced by the alternations of the seasons, as is exemplified in the monsoons of the Indian Ocean. This sea, shut in by continents, is thereby removed from the influences of the general trade-winds, and has a system of currents peculiar to itself, which blow six months in one direction and six months in the other. These are set in motion by the unequal heating of the continents of Asia and Africa in the extreme seasons. In the winter months, the part of Africa south of the equator is intensely heated, while southern Asia is comparatively cold. The current sets then from Asia to Africa. When the sun comes north of the equator, the conditions are reversed, the currents change, and the change is always attended by variable winds and raging storms.

THE "COMING PHILANTHROPIST" has appeared, and is publishing a new paper which is entitled *Truth*, and issued "to benefit mankin ." The first number is so promising that we hasten to get ourselves put down on the free list, by stating that it "can be had, three months on trial, for only ten cents, of news agents, or by addressing Truth Association, Hammontown, New Jersey." This paper expresses its opinions in a forcible manner, and "strikes out" right and left with a hearty will. We are glad to see it make such a stand, and pat it patronizingly on the back, hoping that it will not indulge too largely in its "announcements."

Winter-Dwellings of Alaska.

The ideal of comfort is purely comparative. What in the ruder stages of civilization is considered a luxury, has grown now-a-days to be held as a necessity. And here in our pleasant homes we hardly realize how roughly others are living, unless, indeed, the memory of the earlier days of the country have left a more than commonly vivid impression on our minds.

Our countrymen—for so they must now be termed, must they not?—of the frigid regions of our newly acquired Territory, Alaska, reside in mansions similar to that roughly delineated below, if they are fortunate enough to do so well. If fortunate enough, we say, for Mr. F. Whymper, who traveled pretty extensively in Alaska, in connection with the telegraph enterprise undertaken in 1866 with the view of laying lines from San Francisco to London, via the Russias, considers a settlement, which is made up of such dwellings, a rather favorable sample of an Indian village in that country.



In building such a house, a little shanty is first erected, under which a small shaft is sunk a short distance. From this, a passage is dug several yards to one side, so small that one must crawl through on hands and knees to reach the dwelling proper, which is a square hole in the earth, over which is erected a low roof with a small hole in the top for the escape of the smoke of the fire, which is built directly beneath. In this narrow space live as many persons as can well be crowded in. When the fire gets low, a skin is spread over the smoke-hole to retain the heat, which it does, and also the various perfumes arising from the not over-clean household. The roof, being heated to a certain extent, is a favorite resort for the dogs, who occasionally vary the monotony of the underground life by tumbling down through the smoke-hole on to the fire, scattering the burning sticks, and modifying the odors arising from the old skins, stale fish and other fragrant articles with the perfume of singed hair.

To one unaccustomed to the Indian manner of living, existence in one of these places is at first all but impossible, and staying out in the biting cold seems preferable. Nature has given man, however, wonderful powers of adaptation, and a residence in the country teaches one to accommodate himself to circumstances; and that, moreover, ventilation, however desirable in general, is not apparently absolutely necessary to mere animal existence.

WORTH KNOWING, IF TRUE.—A correspondent of the *Scientific American* says: "I have used the compound of glycerin, oxide f lead, and red lead, for mending a large cast iron kettle that had been fractured across the bottom by allowing water to freeze in it, with the happiest results. It takes some little time to dry, but turns almost as hard as stone, and is fire and water proof. For mending cracks in stone or cast iron ware, where iron filings can not be had, I think, it is invaluable.

"My method was as follows: Take litharge and red lead, equal parts, mix thoroughly and make into a paste with concentrated glycerin to the consistency of soft putty, fill the crack and smear a thin layer on both sides of the casting so as to completely cover the fracture. This layer can be rubbed off if necessary when nearly dry by an old knife or chisel."

THE latest title of Commodore Vanderbilt is the "Venerable Collossus of Roads."

San Francisco Directory for 1870.

This most valuable book has just been issued in a style which reflects credit on its compiler and publisher. It contains an unusually large amount of interesting matter, together with the carefully prepared statistics.

The condition of San Francisco is but a reflex of the whole coast, so closely connected are the interests of city and country, and the proof contained in the volume of the progress of this place, despite the hard times, must be gratifying to every one.

The number of references is over 65,000, an increase of 14 per cent. since 1868. The population of San Francisco was estimated in September, 1869, at 170,250, including 8,600 Chinese and 9,000 "floating;" a gain in one year of 24,300.

In the past year 850 buildings have been erected, 250 of which are brick; total number in city and county, 18,659. The value of improvements for the year ending June 30, 1869, is estimated at over $9,000,000, besides $1,600,000 expended in street improvements. Among the new buildings, unfinished or completed, may be mentioned the new Mint, to be 225 by 165 feet, and two stories high, to cost $975,000; the Grand Hotel, on New Montgomery and Market streets, nearly completed, and costing some $400,000; the addition to the Occidental Hotel; the Pacific Bank, Harpending's Block, Friedlander's Block, and others.

The value of real and personal property is set down as $106,414,029, as returned for the last fiscal year. Rate of taxation on this is $3.05. The total current expenses for the last year were $2,086,158.

Among other very valuable matter are a series of meteorological observations by Dr. H. Gibbons, made during a series of 19 years. The driest season was 1850 to '51, when only seven inches of rain fell; the next 1863-4, with 8½ inches. The winter of 1867-8 gave the most rain—40 inches. An early beginning and an abundant supply are apt to go together, but there is no infallible rule; the latest beginnings have been followed by an average supply.

There is also a description of the railroads on the coast, a chronological history for the past year, an account of the State University and other institutions, list of municipal authorities, United States and State officials, fire and police directory, etc., etc. There is, moreover, a good map of the city.

A glance at the list of names shows a queer condition of the city. We have but 1 Lawyer and no Clients; 3 Judges, but of Courts only 1; 15 Parsons and 2 Deacons, but only 1 Layman; no Doctors, but 1 Ague, 5 Paines and 2 Fitz; 2 Abbeys with 15 Abbots, 17 Bishops and 3 Monks, but only one Nunn. A monarchical tendency is denoted by the presence of 75 Kings, 12 Princes, 1 Princess, 3 Dukes, 2 Barons and 19 Lords. Hymen evidently holds powerful sway, for there are 13 Benedicts and no Bachelors, although 20 Husseys exist; yet there are 7 Loves and no Lovers. We find 15 Barbers and only 8 Beards; 207 Millers and 21 Mills, but only one specimen of Wheat; 74 Bakers but no Doe, and only 12 Beans; 7 Shepherds and 17 Lambs; 4 Farmers with 2 Cows, 10 Kidds, and a plenty of Hay; with 1 Coal and 1 Bellows we have plenty of Sparks and Ashes, but no Fire; there are 60 Fishers, but only 9 Fishes; 34 Coopers and 14 Barrells; 34 Masons with 50 Stones, and 1 Brick but no Mortar; 22 Carpenters, with 5 Augers, 4 Hammers, 1 Mallet, 5 Planks and lots of Wood; 34 Sawyers, but no Saws; 7 Miners, but no Mines; 2 Butchers, with 7 Hams and 14 Bacons; 3 Barmen, with only 1 case of Port, 1 of Rumm, 2 of Beer and 2 of Bitters. We have lots of Silver, but no Gold, and only 3 Shillings; 9 Hands and 1 Mitten; 1 Foot and 1 Legge, and a pair of Bootz. The peculiarity of our climate is denoted by our having in the past year 5 Springs, 3 Summers, 2 Falls and 18 Winters, while there have occurred 5 cases of Frost, 15 of Snow, 18 of Hale, 3 Storms and 1 Rain.

We have 20 Porters and 3 Bags; 4 Robins, 1 Jay, 30 Cox, 1 Henn, 24 Cranes, 1 Stork, 5 Crows, 1 Peacock, 5 Sparrows, 8 Hawks and 1 Duck, count up apparently to only 12 Birds. We raise 25 Berries, 7 Lemons, 3 Plums, 2 Peaches, 2 Mellons, and 6 Appels. Our standing army consists of only 1 Major, with 53 Cannon and 25 Guns, yet 20 Savages roam unmolested about the streets. Little Jack Horner is still alive, and 610 Smiths, 44 of them known simply as John, flourish in our midst.

An Execution by Hara-Kiri.

This ceremony is practiced in Japan as an honorable expiation of crime, by which all disgrace is blotted out. It is of a strictly judicial character and recognized as such; and the executioner who deals the final blow is selected from the friends of the victim.

Lately an official was condemned to perform the Hara-Kiri for firing on a foreign settlement. A secretary of the British Legation to Japan was sent officially to witness the execution, and has furnished an account to a London magazine. The word Hara-Kiri, it may be observed, means "belly-cutting," or self-immolation by disembowelling.

The witnesses, representatives of the authorities, of the victim's family, and of the foreigners, were led to the main hall of a large temple. The condemned man, accompanied by the executioner, one of his pupils, who had been selected on account of his skill in swordsmanship, soon entered, saluted those present with great deference; then mounted on a raised platform before the altar, prostrated himself before this twice, and seated himself on the carpet with his back to the altar. An official presented him with a dirk, nine inches long and as sharp as a razor, with which the act is to be performed.

After a confession of his guilt, and asking those present to honor him by witnessing his immolation, the man slipped his garments down to his waist, tucking his sleeves under his knees that he might fall forward in death, as becomes a noble Japanese. Then with deliberation and coolness, he stabbed himself deeply below the waist on the left hand side, drawing the dirk slowly across to the right side, and turning it in the wound to give a slight cut upwards. When he drew the dirk out he leaned forward and stretched out his neck; an expression of pain flitted across his face for the first time, but he uttered no sound. At this moment his pupil, who, crouched by his side, had keenly watched every movement, sprang to his feet, poised his sword a second in the air; there was a flash, a dull, ugly *thud*, a crashing fall; with one blow the head had been severed from the body.

A dead silence followed, broken only by the noise of the blood gushing out on the floor. Then the executioner bowed low, wiped his sword and retired. With extreme dignity and solemnity, the government representatives rose, crossed over to the foreign witnesses, called them to witness that the sentence of death had been faithfully carried out, and left the hall. Slowly and solemnly the others followed, leaving the still warm body alone in the place where it had fallen.

THE EAST RIVER BRIDGE.—Work has already been commenced on the East river bridge at New York, on the construction of the caisson which is to be sunk for a foundation at the base of the Brooklyn tower. The work is already well under way.

Price Reduced, Jan. 1st, 1870.

The Scientific Press, a first-class finely-printed and illustrated paper, is now furnished at $4 a year, which is exceedingly low-priced for a journal of its class and reputation on this coast.

During the past year the publishers of this journal have largely increased the reading space in the paper, introduced a leading department relating to farming and gardening, and published more articles relating to mechanic arts and miscellaneous subjects, both instructive and interesting for the hour. We find this course is well approved by our intelligent patrons everywhere. Located in the mines, cities or agricultural districts, many prefer a journal which brings them information of the more important discoveries in sciences, of inventions and developments in the progress of the leading arts and industries on this coast, to a periodical technically and more specially devoted to either science, mining, or farming alone—whether issued at home or abroad.

With this number we adopt an abbreviated and more convenient title for our paper, but wish it distinctly understood that we shall not abate our mining advocacy—or change other leading departments embraced in our past volumes, except to increase and improve them. The three leading interests represented in the Scientific Press,—Mining, Farming and Mechanic Arts,—closely allied and associated on this coast, "form the base and groundwork of prosperity" of the community in the field it occupies.

Our present patrons can assist by advertising its worth and its price to others, and enable us to continue to increase and improve its reading columns.

Respectfully,
DEWEY & CO.,
Publishers and Patent Agents.

◆

Santa Cruz, December 30, 1869.

Messrs. Dewey & Co —*Gentlemen*:—Yours of the 24th December, inclosing my patent for construction of earthquake-proof wall, was duly received last night. I am highly pleased with the way in which the business has been done. The ability which carried it through, and the scrupulous care bestowed on its preparation, are above praise; and I will gladly intrust to your hands any further business I may have to do, which will soon take place on a very useful and important invention.

Very truly yours, A. McPherson.

Neglected Coughs and Colds.—Few are aware of the importance of checking a cough or "common cold" in its first stage, that which in the beginning would yield to a mild remedy, if neglected, soon preys upon the lungs. "*Brown's Bronchial Troches*," or Cough Lozenges, afford instant relief.

Treatment of Rebellious Silver Ores, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

Co-Operative Union Store.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 2tv18--4w

---

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

To Mining Secretaries:

You will please take notice that the copy for advertisements in the Scientific Press must be handed in as early as *Thursday* evening. Our paper is published on Saturday, but the last form goes to press early on Friday, in order to afford time for sending out our large edition.

Respectfully,
DEWEY & CO.,
Publishers Scientific Press, 414 Clay street.
San Francisco, Dec. 20, 1869.

N. B.—Companies that insert advertising in our mining journal, where such notices appear, economize ONE-HALF THE COST of daily publication. Attention given to inserting notices correctly and legally. Blanks for filling out notices furnished free to advertisers.

The Aerial Steam Navigation Company.

At a meeting of the stockholders of this company, December 17th, 1869, Messrs. Eugene Sullivan, Thomas N. Cazneau, Henry F. Williams and Simon L. Jones were appointed a committee to receive subscriptions for one thousand shares (one-tenth of the capital stock of the company) at the rate of ten dollars per share of the par value of one hundred dollars, said shares to be *unassessable*. The funds thus raised are to be devoted exclusively to the construction of the first aerial steam carriage, and to be deposited in the Bank of British Columbia, to be disbursed upon requisition of Mr George K. Gluyas, Engineer of Construction. The working, drawings, etc, can be seen at the office of Gen Thomas N. Cazneau, No. 321 California street, where subscriptions will be received. No invention for navigating the air has before received such positive indorsements from engineers of reputation, or so liberal encouragement from prominent capitalists' as Marriott's Avitor, which now seems sure of being thoroughly tested on a large scale. 2v20-my

In the Probate Court of the City and County of San Francisco, State of California.

In the matter of the Estate of ABRAHAM CREEMER MESSERVE, deceased.

On reading and filing the petition of Benjamin Shellard, Administrator of the estate of Abraham Creemer Messerve, deceased, setting forth that he has filed an account of his administration upon said Estate in this Court, and that the same has been duly heard, allowed, and confirmed; that more than ten months have elapsed since the publication of notice to creditors, and that no claims against the said deceased have been presented to said Administrator, and the Estate is in a condition to be closed, and that the real property remains to be distributed among the heirs of said deceased; and praying, among other things, for an order of distribution of said real property among the persons entitled,

It is ordered, That all persons interested in the Estate of Abraham Creemer Messerve, deceased, be and appear before the Probate Court of the City and County of San Francisco, at the Court Room of said Court, in the City Hall, in said City and County of San Francisco, on the seventh day of February, A. D. 1870, at eleven o'clock in the forenoon of that day, then and there to show cause why an order of distribution should not be made of the real property of said Estate among the heirs of said deceased according to law.

It is further ordered, That a copy of this order be published at least for four successive weeks before the said seventh day of February, A. D. 1870, in the Scientific Press, a newspaper printed and published in said City and County of San Francisco.

SELDEN S. WRIGHT, Probate Judge.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.

UNION IRON WORKS,

CORNER FIRST AND MISSION STREETS,

SAN FRANCISCO.

MANUFACTURE

ALL KINDS OF MACHINERY

MARINE, LOCOMOTIVE,

And Stationary Engines,

Booker Patent Locomotive Stack,

ARMSTRONG PATENT

Heater, Condenser and Filter, Combined.

BOILERS, HIGH AND LOW PRESSURE,

Pump, Pipe and Sheet Iron Work of all kinds; Quartz Crushing and Amalgamating Machinery, including High and Low Mortar for wet or dry crushing; Furnaces for roasting ores; Horn, Wheeler's, Patton's, and Belding's Amalgamating Pans and Settlers; Hendy's Concentrator; Hungerford's Concentrator; Hunt's Grinder; Blake's Crushers; Stamp Shoes and Dies of the best white iron; Russia Iron Screens, etc.; Flour Mill and Saw Mill Machinery in every variety; Hendy, Gang, Saw Mill, Pumping and Hoisting Machinery; Excelsior Force Pump, for domestic, ship and mining use—the simplest and best in use; Iron and Brass Castings of every description; Steamboat Repairs; Boiler Making executed with despatch. Steam Engines and Boilers constantly on hand and for sale.

We would call particular attention to our

SCOTT & ECKART CUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Offs at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 50 or 60 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Mont'y Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Plainers, Shapers, Drills, Etc.

On hand and for sale, Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

☞ We are prepared to furnish all kinds of Machinery at short notice, as our facilities are unequalled on the Pacific Coast.

H. J. BOOTH & CO.

SAN FRANCISCO
Pioneer Screen Works.

JOHN W. QUICK,

203 Fremont street, near Howard, San Francisco.

Screen Punching of all kinds and qualities for Quartz Cement, Flour and Rice Mills, at greatly reduced rates.

ORDERS SOLICITED AND PROMPTLY ATTENDED TO.

I would call special attention to my slot cut and slot punched Screens which are attracting much attention and giving universal satisfaction, both as regards their efficiency and durability. This is the only establishment on the coast devoted entirely to the manufacture of Screens. It has furnished screens for the principal mills and firms on the coast for many years. 10v19tf

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

8v19-6m

Ayer's Cherry Pectoral,

For Diseases of the Throat and Lungs, such as Coughs, Colds, Whooping Cough, Bronchitis, Asthma, and Consumption.

Probably never before in the whole history of medicine, has anything won so widely and so deeply upon the confidence of mankind, as this excellent remedy for pulmonary complaints. Through a long series of years, and among most of the races of men it has risen higher and higher in their estimation, as it has become better known. Its uniform character and power to cure the various affections of the lungs and throat, have made it known as a reliable protector against them. While adapted to milder forms of disease and to young children, it is at the same time the most effectual remedy that can be given for incipient consumption, and the dangerous affections of the throat and lungs. As a provision against sudden attacks of *Croup*, it should be kept on hand in every family, and indeed as all are sometimes subject to colds and coughs, all should be provided with this antidote for them.

Although settled *Consumption* is thought incurable, still great numbers of cases where the disease seemed settled, have been completely cured, and the patient restored to sound health by the *Cherry Pectoral*. So complete is its mastery over the disorders of the Lungs and Throat, that the most obstinate of them yield to it. When nothing else could reach them, under the *Cherry Pectoral* they subside and disappear.

Singers and Public Speakers find great protection from it.

Asthma is always relieved and often wholly cured by it.

Bronchitis is generally cured by taking the *Cherry Pectoral* in small and frequent doses.

So generally are its virtues known that we need not publish the certificates of them here, or do more than assure the public that its qualities are fully maintained.

Ayer's Ague Cure,

For Fever and Ague, Intermittent Fever, Chill Fever, Remittent Fever, Dumb Ague, Periodical or Bilious Fever, &c., and indeed all the affections which arise from malarious, marsh, or miasmatic poisons.

As its name implies, it does *Cure*, and does not fail. Containing neither Arsenic, Quinine, Bismuth, Zinc, nor any other mineral or poisonous substance whatever, it in nowise injures any patient. The number and importance of its cures in the ague districts, are literally beyond account, and we believe without a parallel in the history of Ague medicine. Our pride is gratified by the acknowledgments we receive of the radical cures effected in obstinate cases, and where other remedies had wholly failed.

Unacclimated persons, either resident in, or travelling through miasmatic localities, will be protected by taking the *AGUE CURE* daily.

For *Liver Complaints*, arising from torpidity of the Liver, it is an excellent remedy, stimulating the Liver into healthy activity.

For Bilious Disorders and Liver Complaints, it is an excellent remedy, producing many truly remarkable cures, where other medicines had failed.

Prepared by DR. J. C. AYER & CO., Practical and Analytical Chemists, Lowell, Mass., and sold all round the world.

PRICE, $1.00 PER BOTTLE.

Sold by all druggists and dealers in medicine everywhere. Crane & Brigham, San Francisco; R. H. McDonald & Co., Sacramento, General Agents. 15v19eow-4m

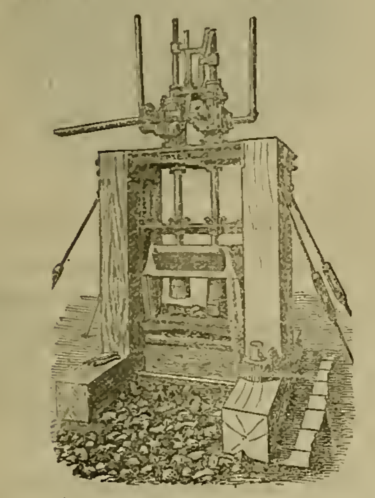
Machinery.

THE WILSON

Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELE, Agent,
Nevada City, California,

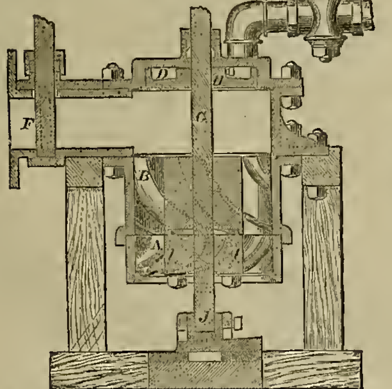
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

Lind's Improved Water Wheel

Fig. 1



Has given the highest satisfaction to parties using it. We are now prepared to sell it at reduced prices. Will also contract for all kinds of Machinery—Flour, Saw and Quartz Mill. All our work guaranteed. We will send competent men to put up our Wheels and Machinery. We contract for or do it ourselves. Our extensive acquaintance with millwrights on this coast enables us to furnish millmen with the best of workmen at short notice. Drawings for contracts furnished gratis. Send for circular.

A. LIND, Millwright,
Pacific Iron Works, San Francisco.

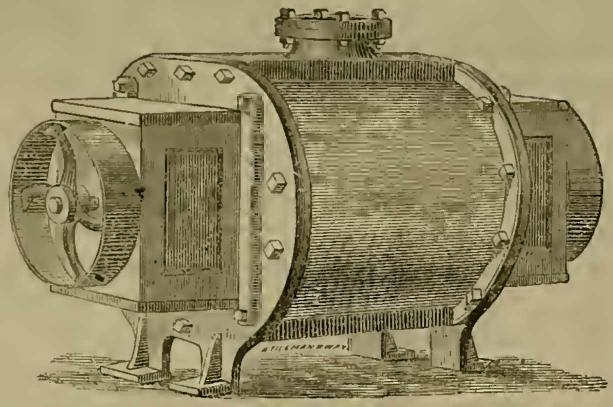
Refer to John Sime and .J. Haley. 19v19

ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

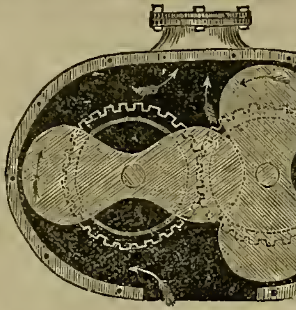
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 21, 1866; and Oct. 9, 1866.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower w in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

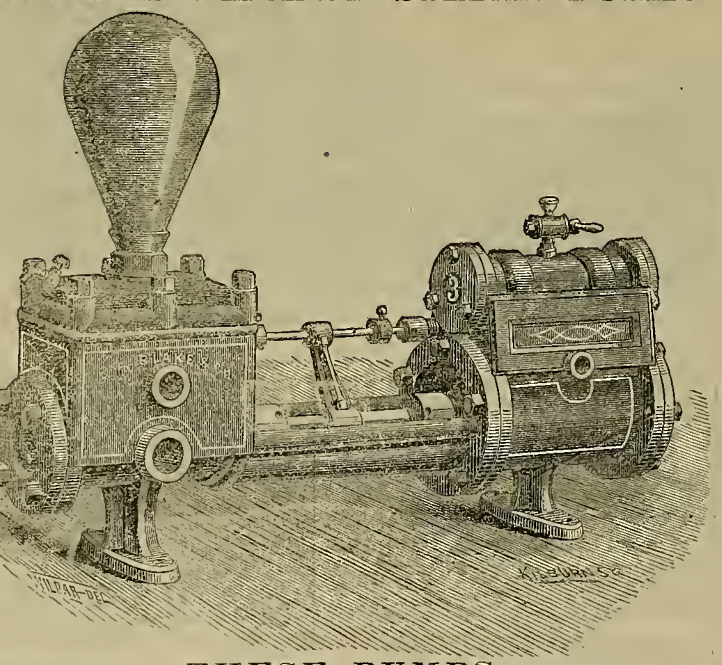
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,
4v16-3m **Globe Iron Works, Stockton, Cal.**

BLAKE'S PATENT STEAM PUMP.



THESE PUMPS

Have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—specially calculated for SIMPLICITY, DURABILITY and POWER.

Some of the advantages of the Blake Pump may be summed up as follows:

IT IS POSITIVE UNDER ANY PRESSURE. *May be run as slow or fast as may be desired.* Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility. Will start at ANY point of the stroke, and will discharge all the water of condensation.

The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having NO DEAD POINTS, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used

On Railroads and Steamboats; in Hotels; for Mining and Fire Purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries,

And as BOILER FEEDERS, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the

Cheapest and Best Pump that Can be Used.

It is offered to the public as the most perfect independent Steam Pump ever invented. TWELVE DIFFERENT are made, capable of throwing from 1,000 to 180,000 gallons an hour, and adapted to any class of work that might be required. For sale by

BERRY & PLACE,
112 and 114 California Street, San Francisco.

☞ Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded. 17v19

Awarded a SILVER MEDAL at last Exhibition of Mechanics' Institute, San Francisco, as being the Best Steam Pump on Exhibition.

This was no empty honor, as four of the principal Steam Pumps of the country were on Exhibition as competitors for the prize beside "The Blake," neither of which received any higher recognition than a diploma or certificate of merit.—*See Official Report of Awards.*

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

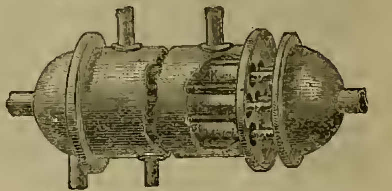
Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, **229** Fremont street,

1v1 San Francisco.

CROSS' COMBINED

Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,

FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.

☞ Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for **50** cents

21v12 F. E. WEYGANT, Proprietor.

Oxygen Making for Street Lighting. The New York *Sun* thus describes the manner of preparing oxygen by the Tessie du Motay process, as practiced by the New York Oxygen Gas Co. in their new works: "In making the oxygen, a mixture of manganate of soda and the oxides of copper and manganese is placed in a number of retorts, which are then heated to a cherry-red heat. Common air, previously purified by being passed through a solution of caustic soda, is then forced through the retorts for the period of ten minutes, during which it gives up its oxygen, oxidizing the manganates in the retorts. For a succeeding period of ten minutes dry superheated steam is forced through some of the retorts, which liberates the oxygen previously absorbed from the air, and carries it off to a condenser, where the steam is cooled into water, and the oxygen set free and collected in an ordinary gas-holder. The mixture from which the oxygen was obtained is then again subjected to a current of common air, and absorbs a fresh supply of oxygen, and again is deprived of it by steam; and this process can be carried on for an indefinite length of time without requiring a renewal of the contents of the retorts. The retorts are in fact so many sponges for sucking the oxygen out of the air, which are squeezed as often as they get filled."

[SPECIAL NOTICE].

Steam Pumps.—These Pumps, although as perfected, of quite recent manufacture, are fast being introduced wherever water or other liquids are to be raised in large or small quantities, against heavy or light pressure. There are a number of different styles now in the market, several of which were on exhibition and operation at the last Fair of the Mechanics' Institute. Blake's Patent stands among the best of these Pumps, the advantages of which are set forth on page 31 of this issue. This Steam Pump was awarded a silver medal at the above exhibition, being the only pump of any kind which received so high an award.

The manufacturers, we understand, are taxed to their utmost to supply the demand. Messrs. Berry & Place, their agents in this city, keep an assortment of sizes always on hand, varying from a capacity of 600 to 30,000 gallons per hour. Their store is at 112 and 114 California street.

One Per Cent. per Month

Allowed on Six Months' Deposits by the CALIFORNIA BUILDING, LOAN AND SAVINGS BANK, California street, one door from Sansome.

To Farmers and all Industrial Readers on the Pacific Coast.

The SCIENTIFIC PRESS, devoted to Farming, Mining and Mechanical Arts, was established in San Francisco in 1860, and has been enlarged and improved until it now contains 16 pages of the size of Harper's Weekly, filled with the most interesting and valuable reading matter of any newspaper in the Pacific States.

The interests of the three great branches of industry on the Pacific Coast—viz: Mining, Farming and the Mechanic Arts—are so intimately connected that the most intelligent readers in one division find it highly desirable to be informed in regard to the discoveries and developments and progress of the others. For this reason we are successful in publishing a large and replete journal of greater value to the intelligent citizens of the Pacific Coast than any other weekly in the world.

Each issue contains engravings of new machinery of various kinds applicable to the Pacific States, and pictorial illustrations of new discoveries and remarkable events and occurrences. Its articles are alive with the spirit of the times, addressed in plain terms within the easy comprehension of all ordinarily intelligent readers, imparting instructions which cannot be obtained from books or in other journals of the past or in other journals of the day.

Sample copies sent free. Subscription price reduced to $4 per annum, January 1, 1870.

N W. SPAULDING,
Saw Smithing and Repairing
ESTABLISHMENT.

Nos. 17 and 19 Fremont St., near Market,
MANUFACTURER OF
SPAULDING'S
Patent Tooth Circular Saws.
They have proved to be the most durable and economical Saws in the World.
Each Saw is Warranted in every respect.
Particular attention paid to construction of
Portable & Stationary Saw Mills.
MILLS FURNISHED AT SHORT NOTICE,
At the lowest Market Prices.

Important to Assayers.
Crucibles.
The Patent Plumbago Crucible Co.
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco. 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
18v18-9p 519 Front street, San Francisco

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 18v6-1y16p

Beet Sugar Manufacture.

It is stated that the recent experiment in beet sugar manufacture in Sacramento has proven so successful that the company proposes to sow 300 acres the coming season, from which they expect to realize 8,000 tons of beets;—300 tons only having been raised by the company last season. Large quantities will also be raised by outside parties, all of which the company will take.

A Sacramento correspondent of the *Bulletin* says that within sixty days three new companies will be formed in that city for the manufacture of sugar from beets. This movement has been brought about by the favorable reports received of the beet sugar manufactories in Wisconsin, and the increased success which is confidently expected from the more favorable conditions of soil and climate in this State, coupled with the results actually attending our preliminary tests.

This subject is one of great importance to the people of California. The quantity of refined sugar consumed in the Pacific States and Territories, is immense: much greater in proportion to our population, than in any other part of the world. The tariff on imported raw sugar is from 2½ to 3½ cents per pound, which affords a very handsome protection for domestic producers. If that is not sufficient, we trust the Legislature, now in session, will offer a premium sufficient to give the business a fair start. Since beet sugar will come in as a new and untried article, manufacturers will be compelled, at first, to place it at a very low price, in order to displace foreign sugars. For this reason the business may require special encouragement at first; but there is good reason to believe it will soon be able to take care of itself, and save to the State, annually, many times the amount of money which may be expended in securing for it a vigorous start—to say nothing of the thousands who will thereby find remunerative employment, if the introduction of beet sugar becomes general on this coast.

* * *

The Sutro Tunnel Co.—We refer our readers to the advertisement of the company in another column. It will be seen that some excellent names occur among the officers of the concern, which, through the indefatigable exertions of Mr. Sutro, has at last assumed an important place among our mining incorporations. That the tunnel, if finished, will prove a great help to the legitimate mining enterprises on the Comstock lode, is not to be doubted, and the announcements set forth are most alluring. A telegram of Thursday states that the tunnel was then in 500 feet. Nine feet per day has been made the past week.

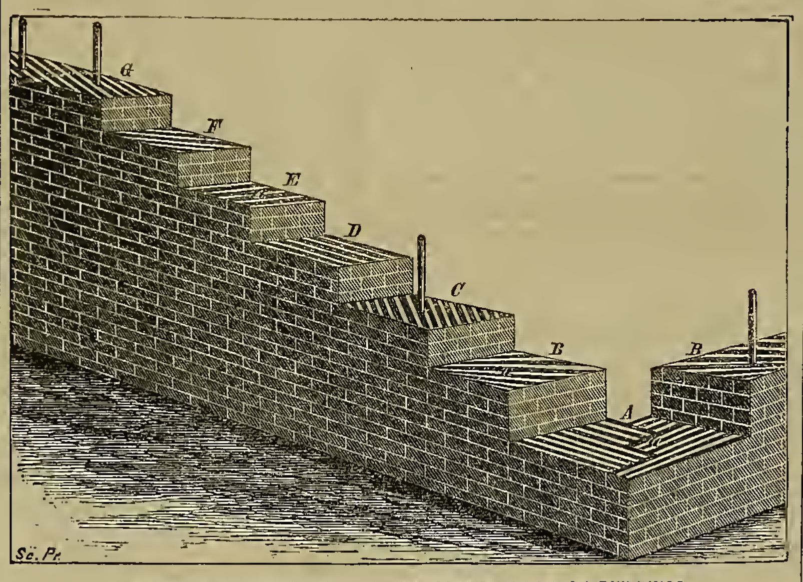
The first number of the *Living Way*, a S. F. monthly, edited by S. D. Simonds, which is intended "to give varied experiences of Christain life, and such discussions of Scripture as shall show the living character of Revelation," has just been received.

Improved Construction of Buildings.

A contest between man and Nature is always going on to a certain extent, in which man, although continually victorious, still finds ever new issues to be grappled with—new obstacles to be overcome. One of Nature's strongest tactics on our coast and elsewhere has been to shake the ground beneath our feet; to cause us to distrust the very foundation of all things. While we do not as yet attempt to prevent this shaking, we are trying to find devices by which its effect may be neutralized; and one of these devices—McPherson's improvement in the construction of buildings—we illustrate this week.



McPHERSON'S IMPROVEMENT IN THE CONSTRUCTION OF BUILDINGS.

The construction is at once very simple and inexpensive, and very efficient in binding together the walls of buildings of stone, brick, or other similar material, to a solid unity. It consists simply in laying between the different courses, at regular or irregular intervals, according to the nature of the wall, layers of lath, strips of wood or thin metal (denoted in the cut by *a*), in such a manner as to bind the wall in every conceivable horizontal direction; and, moreover, in placing others in an upright position, binding the wall in a vertical direction as well.

In constructing a building, a broad foundation is made, a few courses of brick or other material laid, and then the strips placed as shown at A. These are laid in mortar, similar to the usual manner of laying bricks, and a thin coat of mortar placed upon them, in which the next course of bricks is laid.

The foundation wall is then continued in the usual way, each course of bricks being set in a short distance, so as to cause the walls to become of less thickness as they rise. Between each set of a few courses, strips are laid as before, but in varying directions, as shown at B, C, D, and E, thus binding the wall very firmly, and, as it were, breaking joints at every successive place, as is especially necessary at the corners. When the foundation is finished, the regular wall of the building is carried up, and the strips laid in a similar fashion. Particular care is given to have the foundation and the upper part of the building especially strong, and in this way the resulting solidity of the whole is such that it resists the most violent shocks.

In order to keep the walls from being moved sideways from their position—that is, to prevent the result that would be caused by a sudden jerking of the earth, and which is usually found to be a movement of the upper part of the wall in one direction and of the lower part in another—between the bricks, at irregular intervals, are placed upright laths, or strips or rods of metal, around which are placed the brickwork.

The inventor prefers common plasterers' laths, as they will answer every purpose, and can be obtained at a small cost. These laths, when used, to prevent rot, are boiled in brine or other preservative solution.

Walls laid and bound together in this manner can be built at the same cost as walls constructed in the ordinary manner of brick, stone, concrete or adobe, while their value will be greatly enhanced, especially in countries subject to earthquakes.

Among other opinions as to the worth of Mr. McPherson's invention, the following is taken from the Santa Cruz *Times:*

> The invention has been examined by quite a large number of mechanics, and there is but one voice with regard to it. They all say that it is the only plan yet discovered by which walls can be firmly bound together, and prevented from falling during heavy shocks of earthquake or fire. We hope that the plan will come into general use, and be the means of putting a fortune into the pockets of Mr. McPherson; for a man who discovers a plan like this becomes a benefactor of his race.

The patent for the above valuable invention has been obtained, under date of Dec. 14, 1868, through the Patent Agency of the Scientific Press, for Mr. Alexander McPherson, of Santa Cruz, Cal.

Legislation on Accidents.

The terrible accidents which have of late occurred in mines, and more particularly those at Avondale, Penn., led to some action in Congress on this point. Last month the House Committee on Mines and Mining was instructed to investigate the causes of the accident referred to above, and to report a bill for the prevention of such accidents in coal mines, if such can be done constitutionally. The committee were also to report on the propriety of creating a "Committe of Public Safety, whose duty it shall be to investigate the causes of all accidents whereby human life is endangered or lost, and to recommend legislation to provide against the happening of the same, and to punish those persons by whose negligence or carelessness they may be occasioned."

The first part is well enough as far as it goes, but the latter portion quoted is rather out of the question. Still, we are glad to see some tendency to take fuller action in such matters. The repetition of accidents of all kinds is getting fearfully frequent, and it would seem as if we must have some law providing for the punishment of carelessness in such cases. A Committee of Public Safety, however, would hardly answer.

In some countries, for the prevention of mining accidents, there is a governmental police, who have the authority to inspect mines, to demand the remedying of any weak points they may find, to insist on the workings being carried on under certain rules, etc., and to prosecute or even cause the arrest of the mine-owners if their orders are not followed. Such a police would probably hardly accord with the general spirit of our people, who resent any such interference with their private affairs. Still, as the country gets more and more thickly inhabited, the necessity of some similar measure is more deeply felt, and we think that in many places now, the appointment of Mining Inspectors with certain limited powers would be rather advisable.

Death of an Old Engraver.—Mr. E. L. Barber, a well known wood engraver of this city, and an old and esteemed citizen of Sacramento, died on Saturday last of paralysis, from repeated attacks of which he has been suffering for some four or five weeks. His funeral took place on Monday afternoon, at the Howard Street M. E. Church, of which Society he was one of the stewards.

* * *

Knitting Factory in Oregon.—The Beaver Hosiery company has been organized in Salem, Oregon, and has already commenced the manufacture of hose, and half-hose, with a capacity of 500 doz. pairs per month. The machinery has been placed in the same building with the Willamette Woolen Factory.

Communications.

Mills and Mines of Colorado—No. II.

BY ALMARIN B. PAUL.

[Written for the Scientific Press.]

The next mill in order is that of the Bay State Co. of Boston, which is located about half way between Upper and Lower Empire. This mill has twelve stamps of about 500 pounds each, and is full of various contrivances. In this mill

The Crosby & Thompson Process

For desulphurizing ores was tried. The furnace for the process consisted of three iron cylinders, the upper above the space between the two lower, with a fireplace below. The ore was introduced into the back end of the upper cylinder, which being inclined to the front, by revolving, slowly carried the ore to the front part of the furnace, where it was delivered into an apron or receiver, which divided the ore into two parts and discharged it into the two lower cylinders, which were kept at a cherry-red heat. These cylinders inclining to the back, carried the ore by their revolution to the opposite end, where it was delivered into a chamber and thence conveyed away for amalgamation.

Inside each of the two lower cylinders is a two-inch gas-pipe with any number of holes in its surface, the object of this being to introduce oxygen into the interior of the cylinder, in order to intensify the heat. Inside these cylinders are also arranged lifters, which, as the barrel revolves, carries the ore up a certain distance, and then allows it to fall through the heated atmosphere. The cylinders have no lining. The smoke or fumes from them are led into chambers and showered, in order to precipitate the golden particles which otherwise would be carried off by the draft. The expense of the process rendered it unprofitable.

The Allen Amalgamator.

Among other things, I noticed an "Allen amalgamator," which is a shallow pan, with a dish or cover which comes down to the surface of the mercury. The ore goes into a tube, which is elevated some two feet above the mercury, which is calculated to give pressure enough to force ore through; the disk being down to the mercury, the gold must come in contact with this. This pan was tried in California, to my certain knowledge, twenty years ago.

The Collom Concentrator.

This is a box some 2x3 feet, which is divided into four compartments. In the two side divisions, where the ore is, are placed screens of such size as may be desirable. In the two central compartments, into which fresh water is continually flowing, are plungers. These latter force the water alternately into one and then the other of the outer divisions, thus sorting the ore and carrying off the lighter particles. This appears to be a cheap and at the same time practical concentrator.

Remarks.

I am thus particular to give the minute details, in order that the miners of California and Nevada may see how far ahead or behind they are, as the case may be. One thing I see very clearly: that the people of Colorado have been commendably enterprising in endeavoring to advance the interest of mining by testing everything which appeared to be feasible; thereby at times deriving profit, at others incurring loss, as you may well suppose. From the ideas I gather, the ore I see and the tendency of the milling operations, I should not think it too much to say that, if they develop as I am inclined to think they will, California in the future will have nothing to brag of in the way of advanced milling.

I did intend to give you a description of Rae's Electric Process in this letter, but must defer it until my next.

◆

Of the 1,095 mountains in the moon, measured by Beer and Madler, 39 are higher than Mont Blanc, and 6 are 20,000 feet high. The annular (or circular) mounttains are highest, Dorfel, near the southern pole, measuring 26,691 feet, or nearly as high as the highest peak of the Himalayas, the loftiest summit of our own globe. And there are also circular caverns, or craters, in our satellite, which are 24,000 feet deep; and some are 100 to 130 miles in diameter.

Milling Processes.

Editors Press:—In looking over your impression of the 4th inst., I am glad to observe the very forcible and out-spoken manner in which your correspondent, Mr. Charles H. Aaron, treats the subject of "rebellious ores" and the operations of "practical men" and "doctors." I am quite of Mr. Aaron's opinion, that any of the silver ores of Nevada may be worked to 80 or 90 per cent. of their assay value by many simple and inexpensive methods, well known to metallurgists; and these results will doubtless be obtained when metallurgists are employed to take charge of mills and other reduction works. It would be highly unjust to the majority of millmen to include them in the class described by your correspondent, they being characterized, as a body, by an unusual amount of good, sound common sense. But, as not more than one in a hundred is possessed of the necessary elementary knowledge of chemistry or metallurgy to be able to determine the minerals, or suggest the best mode of reduction, it is not to be wondered at if they persist in adhering to the most generally followed processes, and continue, knowingly, to throw away a large proportion of their bullion, till one of their number oversteps the line of routine, and at his own risk and cost proves the advantages of some other system of working.

As an instance of this over-cautious adhesion to routine, I may mention a case that came under my observation some time ago;—of a mill-owner expending, annually, some thousands of dollars for sulphate of copper, which was duly converted into carbonate and thrown away in the tailings, after being decomposed in his pans by the carbonate of lime matrix of the ore. This gentleman had been accustomed to use sulphate of copper with the *quartz* ore of the Comstock, and considered he was doing the "correct thing" in continuing to mix it with his *calcareous* rock. My suggestion, that this heavy and utterly useless expenditure should cease, was replied to by a good-natured, incredulous smile, with a Lord Burleigh shake of the head; and I have reason to believe this "practical" operation is continued to the present day, not only by the gentleman in question, but also by the numerous "practical men" at present operating on the calcareous ores of White Pine.

W. T. Rickard, F. C. S.

Leviathan Mine, Alpine Co., Dec. 27.

Our correspondent ought not to be surprised that "practical" millmen, who have been so badly misled by so many pretended "scientific" men, should be rather incredulous when merely informed without proof (if, in the case mentioned, none was given) that a substance, which they have found by experience to be of use in treating certain ores, was utterly useless with others. We need, as everyone will admit, more thorough knowledge of the chemistry of amalgamation. And those who possess this knowledge ought, in reasoning with others, to adduce incontestible proof of their assertions, as far as possible. For instance, many who will acknowledge the fact that calcareous gangue will decompose sulphate of copper in amalgamating processes, may yet require proof that the result is carbonate of copper (and sulphate of lime). And as we are constituted, being apt to run to extremes, if we doubt a part of an assertion, we are inclined to disallow the whole, although we may be acting thereby very illogically.

We are always glad to hear of experiments made, and hope that the discussion which has been excited to a certain extent by the article referred to, will induce correspondents to send us their ideas founded on experience. We intend to make our paper keep up with the progess of the age, and by an interchange of ideas, our readers will greatly aid us and at the same time benefit themselves, and enlighten one another on many points on which many are as yet uninformed.

◆

Another Alpine Tunnel.—It is announced that Dr. Strousberg, the great German railway king, in company with two other gentlemen, has undertaken to tunnel the St. Gothard, and has engaged to have the work completed in less than seven years.

Agricultural and Mining Lands.

The following are abstracts of a speech delivered by Hon. A. A. Sargent, in the House of Representatives, on the important subject of our mining interests and titlest to lands in this State:

Every gentleman is aware that by the large yield of our mines for years past, the Government has been enabled to fulfill its obligations to its creditors, and carry on an expensive war. The means by which those results have been obtained, by which millions of small rivulets have been united into one and made this large stream of gold, are perhaps not entirely familiar to every gentleman within my hearing.

I call attention to a single fact, showing the importance of this supply of treasure; and a few years ago, in the midst of the war, the loss of a single steamer on the Atlantic, freighted with two or three millions of gold, caused a commercial convulsion in New York and throughout the country. The gold and silver yielded by our mines heretofore have been necessary for the safety of our credit, and are necessary for business purposes now and hereafter; and if this House by its action can devise measures that will make mining more remunerative, that will make it more attractive, that will make it more generally pursued, the result will be that the product of the precious metals will be increased, and the necessities of the country so far, better answered.

Titles Necessary to Promote Immigration.

After reviewing the earlier history of the population; their purpose in coming to the State, the manner of holding and transferring mining claims, action of courts on mining titles, and the legislation of Congress bearing upon the mining interests, how far it gave titles, and its objections, etc., he impressed upon the House the importance of a perfect title to promote development. We quote these paragraphs in this connection:

Sir, take any farmer and put him upon a a piece of land where he is liable to be disturbed at any moment, where he remains only at the sufferance of the owner, and what improvements would you expect him to make upon the land? He will be more apt to neglect it in every particular; he will shear it of all it bears and has, that may be immediately valuable to him, and care little what may become of the estate when it shall pass again from his hands or how much it degenerates while he holds it. If you wish to give over a farm to utter waste, subject it to such possession.

Now, to a certain extent, except so far as it may have been prevented by the alliance of the mining community upon the justice of Congress, this is true of mining regions. It has been urged as a reproach against our people that they are nomadic; that they yield to every passing excitement; that upon each rumor that a new mining region has been discovered, they rush to it and leave their old homes. The remedy for that is to attach them to the soil, and give them a right, under wise and proper regulations, to buy that which they have occupied and improved. Then substantial instead of temporary improvements will be made, and the certainty of titles will encourage the investment of capital.

What Legislation is Needed.

Referring to the provisions of the law by which titles to quartz mines are obtained, and the operations of the law, he says:

At this session I have introduced and had printed a bill extending the principles of that law with some modifications; extending it to placer claims; requiring, however, that those claims shall conform to the Government sub-divisions. The Government is now selling here and there through the mining regions under the quartz law, as sites for mills, etc., irregular pieces of ground, without any regard to the system of Government surveys, and which can never be conformed to them. In order to enable the miners to conform their placer claims to Government sub-divisions, it is necessary that Government forty-acre tracts be divided into ten-acre tracts, to enable small claims to be entirely separate, and to adequately separate agricultural lands. Furthermore, it is necessary that there should be some system of joint entry, so that men whose claims interlace each other, as claims will where the veins run so eccentrically as they do there, may make joint entry and conform to the sub-division of the Government in their exterior boundaries. If this is done a great load of expense will be taken from the miner's shoulders in having his claims surveyed and mapped by the Surveyor General. In all places where surveys have been made this principle will immediately beneficially operate; and I intend as part of my measure, that these surveys shall proceed throughout the State.

But a more important amendment which I propose in that bill, provides that this system of restraint, this system of tying the hands of the miners and preventing them, except at great cost, and often entirely from obtaining their titles, shall not be applied to placer claims. * * *

Now, the bill which I have introduced proposes to enact that where there has been actual and *bona fide* possession of a mining claim during the period of time prescribed by the statute of limitations for the mining claims of State and Territory where the claim may be situated, and there is no adverse claims made by any party whatever, after full and fair notice of the application for a patent, this possession will be a substitute for all the machinery contained in those impracticable provisions and regulations requiring miners to trace back their claims through written instruments which never existed to a period so remote as that to which many of these claims extend, and to verify them by a code that has no exact written record.

The price per acre named by Mr. Sargent is $2.50, and he insists that it is a full average value, and no more should in any event be charged. Our space forbids doing full justice to this excellent speech, as any abridgement takes away excellent points. We take a couple of extracts relating to

Timber Land and "Stumpage Agents."

What then do I ask? I propose that the Government shall have those lands surveyed, and that they shall be sold in adequate tracts to support sawmills. This end I think can be gained if they are sold in amounts not to exceed six hundred and forty acres to any one individual or association. If these lands were capable of cultivation it would be another matter, and I would be in favor of reducing the amount to one hundred and sixty acres. But they are not capable of cultivation; and you cannot expect a man to go into the wilderness to carry on a sawmill business unless he can have timber enough to make it profitable.

At this present time, as I learn by papers received from my district within the last few days, inquisitive Government agents are going about in order to ascertain who cut a particular tree, or squared a particular block of timber, or who has run a sawmill. It is an absolute necessity of existence there that those very things should be done, and you provide no means by which they should be done legally. You punish with fines and imprisonment any one who takes those things which are absolutely necessary alike to carrying on of the business of mining, and to the conducting of agricultural pursuits, and to the very existence of our towns throughout the region of the Sierra Nevada.

Speculators and the Agricultural Lands.

As applied to our State, there is something radically wrong in those provisions of our land laws which allow large tracts of land to be taken up by speculators at what is called "private entry." It is the curse of our State. * * * The result has been that to-day, in those valleys of which I speak, six million acres—think of it, gentlemen—six million acres are held by a few men, because these speculators could go to the land office and buy up whole townships or whole counties of the richest land God ever fertilized; buying it for Sioux scrip or agricultural scrip, or any scrip, which, at its depreciated price, did not cost them forty cents on the dollar in gold. They thus got control of all that domain, and they hold it now at prices which exclude settlement. * * * Now, sir, this illustrates the condition of our State in that respect. It is a blight to our prosperity, a continual curse, turning away the high tides of an immigration that else would gain homes in our midst. I think there ought to be a law passed applying to the whole of the United States, prohibiting, hereafter, all entries of land under private entry. In view of the rapid settlement of the public lands of the United States, we ought to preserve the remnant left to us for actual settlers. When a man loads up his family and household goods in a wagon and starts on his weary journey across the plains, when he reaches the West or California, let there be some small piece of land that he can buy of the Government itself, and not compel him to pay twenty-five or fifty dollars an acre to some speculator for land which he has bought for fifty cents an acre. I believe this is necessary for other States as well as for my own.

Mechanical Progress.

More About the Fields Steel.

We some little time since mentioned that Dr. Fields, of Wilmington, Delaware, had discovered a means of making iron and steel, which, it was said, far surpassed any yet produced in the United States. He has recently been testing his process before experts at the Rensselaer Iron Works in Troy, N. Y.; and we clip the following from a long article in the Troy *Daily Press:*

"Dr. Fields charges one of the ordinary puddling furnaces with a quantity of American pig iron; when the iron is thoroughly melted, he throws into the seething mass a small package of powdered substances. The iron produced is tough and strong, and can be rolled with ease. * * * To manufacture steel, the iron is melted, and the sulphur and phosphorus are driven off as above; another package of different chemicals is then thrown into the furnace and thoroughly incorporated; in ten minutes the entire mass becomes steel. It is then "balled up" and hammered beneath a heavy trip-hammer, and is ready to be used for any of the purposes of steel. Dr. Fields claims that it can be used for the manufacture of fine cutlery. In the manufacture, two-thirds of old cast iron and one third of pig iron can be used, while in the manufacture of Bessemer steel no old cast iron can be used, but pig iron alone. Another advantage claimed for Fields' steel is, that it can be welded to ordinary wrought iron, while Bessemer steel can not. * * * Dr. Fields will no doubt reap an immense fortune from his discovery. The ingredients of the powders which he uses he keeps a profound secret; refuses to tell the color of the powder, its weight, or in fact anything. To convert 400 pounds of pig iron into wrought iron, he uses a small package of apparently a pound or two in weight. The powder is wrapped in papers, and he permits none even to glance at it. Dr. Fields states that he would not sell the secret for $1,000,000. Judge S. C. Field, of Chicago, has purchased a half interest to use the new process in several States for $265,000."

"PALIER GLISSANT."—This term, which literally means "slippery resting-place," is the name given by M. Girard, the inventor, to a new method of lubricating journals. In it no oil is used. Water is the lubricant; and it is so applied, by means of hydraulic pressure, as to actually *lift* the journal, and hold it slightly away from contact with its box. By means of a pipe leading from a pump, the water is admitted through openings directly into the box, where it completely surrounds the journal in a thin film, which being under pressure constitutes a liquid cushion. The pump is worked by the machine itself. The water of course constantly escapes, but in very small quantity. The journal is in this manner so effectually lubricated that of two wheels, similar in every respect, one of which is lubricated in this manner, and the other with oil, and both of which are set in motion at the same moment and with the same velocity, the latter will come to rest before the speed of the other is perceptibly slackened. The additional power imposed upon the machine, of working the pump, is found to be more than doubly compensated for by the saving of the usual loss by friction.

BETTER THAN THE COMPRESSED-AIR BRAKE.—D. P. Davis writes to the *American Artisan* of a device for the same purpose as the compressed-air brake for railways, which was patented about a year ago, and which "consists of a simple self-acting valve, opening outward, and placed anywhere in the exhaust passage of a locomotive cylinder. For convenience of adaptation and economy it is generally placed in the blast-nozzle. As long as the engine is running the valve remains open, being opened by the pressure of the exhaust steam; but at the moment when the pressure below the valve becomes less than that of the atmosphere the valve closes; so that in reversing the engine the valve will close instantly, and exclude the hot air and ashes which are always contained in the smoke box."

Spring Motors for Sewing Machines.

At a late meeting of the Polytechnic Association of the American Institute, an apparatus for operating sewing machines by a coiled spring was exhibited. In the discussion which followed, Mr. G. H. Babcock made these remarks: "Some eight or nine years ago this same subject came up before the Society. I had the honor of calling attention to the fact that some motor was required for driving sewing and other small machines for family purposes, and thereupon I was beset by numberless inventors, nearly all of whom proposed some form of spring power or clock-work. In order to set this thing at rest, I instituted a series of experiments to determine the amount of spring required to drive a sewing machine for a given time. I first found by trial that to drive a Wheeler & Wilson machine at the rate of 600 stitches per minute required some 550 foot-pounds.

"I then proceeded to ascertain how many foot-pounds of work could be obtained from one pound of steel. From a large number of experiments I came to the conclusion that for the style of spring which would be required for such work, 45 foot-pounds was all that could be safely depended upon in actual use.

"Now, as at least 20 per cent. of the power of the spring would be used up in friction of the machinery required to transmit its power, it would take a spring capable of exerting not less than 690 foot-pounds to drive a sewing machine one minute; and this would require fifteen pounds of steel per minute, or 900 pounds of spring per hour, to drive a sewing machine; and 9,000 pounds for ten hours!

"Again, the power of a strong man turning a crank is but 3,000 foot-pounds per minute, when working eight hours per day, but for a short time he can exert about twice that power, or 6,000 foot-pounds per minute. It would, therefore, take him one hour and ten minutes to wind up a spring which would drive a sewing machine for *ten* hours. From these figures it is evident that no form of spring power is applicable to this purpose; and it is still a problem for inventors to furnish some simple and cheap motor for this and similar purposes where a small power only is required."

BLAST ENGINES.—In an article on the Creusot Iron Works, written for the *Iron Age*, we find the following: "It is a curious fact that to-day ponderous beam engines are being erected in the Lehigh Valley, whilst at the Creusot, where forty-five to fifty blast engines have been constructed in all, the walking beam type has been abandoned for a number of years, although the first blast engines they ever erected were of that type. The direct-action engines have been substituted for them; they are made with horizontal cylinders for small and medium engines, and with vertical cylinders for the more powerful types. In both these systems, the steam and blast pistons are directly attached to the same rod, and the motion is regulated by a fly wheel. These types are of great simplicity; all losses are reduced as low as possible. The air passes through flap valves and the steam through slide-valves in horizontal engines, and through seat-valves in vertical engines. In either case the steam acts expansively."

NUT-SHAPING MACHINE.—A new English invention is thus described: The machine is for the purpose of shaping the external faces of hexagonal nuts, and consists of six horizontal revolving cutters, arranged radially at the same level, and driven by a single bevel wheel gearing into the six bevel pinions that carry the cutter spindles. The cutters are so fixed in their spindles that when the cutting edges of one tool are horizontal, those of the adjoining one are vertical, and they consequently miss one another in revolving, and can thus operate on work the faces of which are narrower than the breadth of the cutters; by this means the contiguous faces of hexagonal nuts are all shaped simultaneously by the revolving cutters. The nuts to be shaped are threaded upon a vertical center mandril, to which a vertical feed motion is given, traversing the nuts upwards or downwards in the middle of the revolving cutters; and the shaping of the six faces of the whole row of nuts on the mandril is completed in a single traverse of the machine.

A FLUTED AXE.—This is a Michigan invention. The *Mechanic and Inventor* gives a cut of it. It is claimed that it enters the wood more easily than one of the old form, and is more easily withdrawn.

Scientific Progress.

Notes on the Earliest Discoveries in America.

In *Silliman's Journal* for November, Henry Stevens gives some Historical and Geographical notes on the earliest discoveries in America, which he illustrates with photo-lithographic *fac-similes* of some of the oldest and most important maps and charts. After giving a memorandum of the authorities extant upon the subject, he says:

"A new summing up of North American discovery has appeared in a *magnum opus* published in April of this year by the Maine Historical Society, nominally the History of the Discovery of Maine, but really the history of the discovery of the whole eastern coast of North America. This learned work by John G. Kohl, LL.D., is presumed to be the culmination of all that is known and recorded on this vast subject from Adam of Bremen to Kohl of Bremen, and may, therefore, be held as the present state of the history of North American geography and discovery. There is appended a remarkable paper on the *four* voyages of John and Sebastian Cabot, by M. D'Avozac of Paris, in which the distinguished French geographer, on several important points, express views precisely opposite to those of Dr. Kohl."

M. Stevens proceeds to remark, that the history of the early voyages is in fact so bemuddled that an entire overhauling is necessary; and that although he does not himself profess to be competent to do it, he has at any rate tried. Of the *fac-similes* he says:

"It is not permitted to every one to see and touch the precious originals, scattered and secluded as they are, in various public and private repositories, throughout Europe and America. Not three persons exist, probably, who [have seen them all. The Portolano, or marine chart of Juan de la Cosa, made at Puerto de Santa Maria, near Cadiz, in 1500, is now preserved in the Royal Library at Madrid. It is on ox hide, 5 feet 9 inches long, by 3 feet 2 inches wide. The whole world is laid down, including the entire 360 degrees of longitude, on a given scale of fifteen Spanish leagues to a degree. The chart is well drawn in colors, and heightened with gold, altogether a work of art of considerable pretension. It is acknowledged by competent judges to be the earliest, the most important, and the most authentic geographical monument relating to the western discoveries that has come down to us."

HIGH TEMPERATURES PRODUCED BY STEAM AT 212°.—The *Chemical News* gives a communication from Mr. Spence, in which he details some experiments proving that saline solutions can be raised to a high temperature by the use of steam at 212° Fahr. only. A solution of nitrate of soda, which has a boiling point of 250° Fahr., was placed in a jacketed pan, and steam was let into the intervening space until the solution was raised to nearly 212°. The steam was then shut off, and an open pipe was immersed in the solution, and steam thrown directly into the liquor. In a short time the liquor was found to have reached the temperature of 250° Fahr. It appears that the temperatures to which the solution can be raised are in the exact ratio of their specific gravities, and have no connection with the temperature of the steam, which never exceeds 212° Fahr. The greater the specific gravity the higher the boiling point, and whatever the boiling point of the solution, to that point, or very nearly, will steam of 212° raise it.

OLD FEMALES ASSUME MALE CHARACTERISTICS.—Darwin says: "It is well known that a large number of female birds, such as fowls, various pheasants, partridges, peahens, ducks, etc., when old or diseased, or when operated on, partly assume the secondary male character of their species." "A duck ten years old has been known to assume both the perfect winter and summer plumage of the drake." "Waterton mentions the case of a hen that had ceased laying, and had assumed the plumage, voice, spurs, and warlike disposition of the cock; thus every character of the male must have lain dormant in this hen as long as her ovaries continued to act,"

The Great Auk.

This bird, once very abundant on both shores of the North Atlantic, and whose bones have been found in large numbers in "shellheaps" from British America to Massachusetts, is now believed to be entirely extinct. The last known to be seen alive were two which were taken near Iceland in 1844. There are three specimens in the United States: one in the Smithsonian Museum, one in the Philadelphia Academy of Natural Sciences, and one in the Giraud Cabinet in Vassar College. The last is the one from which Audubon made his drawing. It was caught on the banks of Newfoundland. Professor James Orton, from whose article in the December number of the *American Naturalist* we take these facts, says:

"It was about the size of a goose, with a large head, a curved, grooved and laterally flattened bill; wings rudimental, adapted to swimming only, approaching in this respect the penguins of the southern hemisphere. The toes are fully webbed, the hind one wanting; the plumage is black, excepting the under parts, the tips of the wings, and an oval spot in front of each eye, which are white. It was an arctic bird, dwelling chiefly in the Faroe Islands, Iceland, Greenland, and Newfoundland. It was an unrivalled diver, and swam with great velocity. One chased by Mr. Bullock among the Northern Isles, left a six-oared boat far behind. It was finally shot, however, and is now in the British Museum. It fed on fishes and marine plants, and laid either in the clefts of the rocks or in deep burrows a solitary egg, five inches long, with curious markings, resembling Chinese characters.

By which of the great causes of extinction, slowly but incessantly at work in the organic world, the Great Auk departed this life, we cannot say. We know of no changes on our northern coast sufficient to affect the conditions necessary to the existence of this oceanic bird. It has not been hunted down like the Dodo and Dinornis. The numerous bones on the shores of Greenland, Newfoundland, Iceland and Norway, attest its former abundance; but within the last century it has gradually become more and more scarce, and finally extinct."

LATE EXPLORATIONS IN UTAH AND ARIZONA.—At a late meeting of the Geographical Society in the Cooper Institute, New York, Prof. Newberry delivered an address upon the subject of the discoveries made by the Government expedition to which he was attached, the chief object of which was to explore the region through which passed the old trail from Santa Fé. Near the course of the San Juan river were found ruins of immense structures, a view of one of which he exhibited, built regularly of bricks, a foot in thickness, and about eighteen inches in length, with the joints properly broken. This structure was as as large as the Croton reservoir. Inside were rooms nicely plastered. There were traces of extensive canals, which, constructed to bring water, were received into large cisterns. Prof. N. exhibited pieces of pottery which he said abounded. He gave it as his opinion that the depopulation was attributable to warlike hordes from whose incursions the peaceable Aztecs had been gradually wiped out. The only people left now were the Mokies, who lived in towns enclosed within high, thick walls, and who were almost inaccessible. These people were visited, and the explorers were received by them with hospitality.

PROF. ROOD ON THE ELECTRIC SPARK. As a result of various experiments, Prof. R. finds that the discharge from a Leyden jar charged by an induction coil, is composed of three parts or successive acts—a white flash, a brownish-yellow gleam, and a fainter and more lasting glow, which, with brass electrodes, is green, and, with platina, grey, in color. The duration of the entire phenomena is from 17 to 50 millionths of a second. The duration of the white and yellow light together is 6 to 8 millionths, and that of the white flash alone less than 24 hundred-millionths, of a second.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

The Exchequer.—*Chronicle*, Jan. 1st: Preparations are making for starting up work in this mine, better known as Buckeye No. 2, lately purchased by a London company. The company have also purchased Davidson's mill, and in the spring will build a road direct from the mine. Captain Chalmers, Manager, will leave London this month.

New Start.—*Miner*, Jan. 1st: The owners of the Sam. Booth, Esmeralda and Alart combined properties, having purchased the Wide West tunnel, will put a force at work on Monday. This tunnel is in over 200 feet, along the east casing of the Tarshish lode, of which the Schenectady S. M. Co. have the north extension.

Approaching.—The workmen of the Schenectady S. M. Co., and in the Monitor C. M. tunnel No. 3, both on the Tarshish ore deposit, are now so near together that they can bear each other's shots.

Imperial.—From the rock now coming out, we should judge them to be very near an ore deposit of value.

AMADOR COUNTY.

Kennedy Mine.—*Ledger*, 8th: After a run of 15 days they cleaned up last Saturday, and took out over $2,000. They have crushed the rock promiscuously as it came from the shaft and cut.

CALAVERAS COUNTY.

Railroad Flat.—*Chronicle*, Jan. 8th: Work has been resumed upon the Bald Eagle....The owners of the Petticoat are pushing their new mill, and the erection of machinery for hoisting is progressing. The stope exhibits a splendid vein, six feet in width. Gold can be seen in any portion....The Lewis Bros. have suspended work for the present. Increase of water has rendered it impossible to keep the mine clear with horse-power. Steam works will be erected in the spring. Forty tons of first-class ore are on the dump, which will yield $200 per ton; also 70 tons of second grade, worth $45....The 120-foot level of Sanderson & Co. has been driven 60 feet. The face of the drift shows a 10-inch vein of rich quartz....Mitchell & Co., near the Chapman, are taking out quartz worth $25 per ton. Water will probably prevent the development of the mine for a time....The Essex, Poe & Co., is a large vein, and can be worked with little expense. The ore averages well....Clark's hydraulic on the flat, keeps up its roar, sending enormous quantities of gravel through the flume. ....Owners of placer claims are waiting for rain.

Quartz Elsewhere in the County.—At Angels, the Big mine and Sickle's mills are kept in constant operation. The first is running 30 and the latter 15 stamps. At Fourth Crossing, Thorpe's mine is turning out first-class ore. On the same belt are the Gwin and Alexander, each of them turning out large quantities of bullion and giving employment to many hands. On the eastern belt, at West Point, Mosquito, Glencoe, Railroad Flat, Sandy Gulch and Sheep Ranch, the quartz mines are turning out first rate. In these districts quartz is frequently worked that pays over a hundred dollars per ton; less than $20 rock is thrown aside.

EL DORADO COUNTY.

Mining.—Placerville *Democrat*, Jan. 8th: All the claims in this vicinity that are being worked, pay well, but the cry is more water and cheaper. Ten thousand inches could be sold at ten cents an inch in this township, and the mining ground is here to justify the building of a ditch of that capacity. Quartz leads that are being worked are paying well. Van Hooker & Co. have struck a lead up Cedar ravine, which shows plenty of free gold.

Gold Dust.—During the last week, dust valued at $10,800 has been shipped from this city.

MARIPOSA COUNTY.

Not Sold.—*Gazette*, 7th: The Washington mine, near Hornitos, is not sold as reported. One hundred and thirty thousand dollars in gold were tendered, but refused. This is one of the richest mines in Mariposa county, the average monthly clean up being over $8,000, while the running expenses of mine and mill (20 stamps) do not amount to $2,500.

NEVADA COUNTY.

Mining Items.—Grass Valley *Union*, Jan. 7th: The Union Hill mine gives a clean up for the month of $16,300, the largest yet. This will give a profit to the new owners of between $7,000 and $8,000. In the bottom of the shaft the ledge is larger and richer than it has ever been since the mine was opened....The Idaho Co. is working in better rock. The new shaft is to be six by twenty-four feet. The workmen are now raising this shaft from the 100-foot level to the surface. The rock to the east of the works is as good as in any part of the mine. ....We learn that the Eureka never looked better....We are told that the North Star at its last clean up made a good showing, to the credit side of the sheet. The ore coming out is good....The West Eureka is being worked constantly, and the owners are hopeful....The Coe will start up in a few weeks. Bids for opening the works are before the company....The Empire is working full-handed....At the Perrin, drifts are being run and levels opened. No rock is being taken out except to pay expenses. The work will not be finished for some six weeks, when regular crushings will begin. ....The Banner, of Squirrel Creek, have another crushing ready, and good judges say that it will go $100 to the load....Contracts for working the Inkerman, near the North Star, have been entered into....At the Allison Ranch, sinking is the order of the day. The work, except running the engine, is done by contract....The Dromedary has a crushing now at Ben McCauley's mill. The rock looks well....From the O'Connor mine we observed yesterday some good-looking quartz....The Seven-Thirty Co. has had a crushing which paid over $30 a ton....The William Penn is being worked night and day in sinking and running drifts.

Pittsburg.—*Transcript*, 9th: The mine continues to pay handsomely. About 90 men are constantly employed, and the mill is kept running night and day.

Started Up.—The hydraulic claims of Marselus & Maltman have been started up. They have plenty of water, and are using one of Craig's largest size nozzles.

Mutual Co.—*National*, 10th: At Findley & Co's this morning, we were shown two lots of gold, worth $4,000, the result of a month's run on ore from the Mutual, at Eureka South. During the month the mill was idle for several days.

Jim Mine.—*Gazette*, 11th: Mr. Lloyd, of the Jim mine, Eureka, passed through town yesterday, with a $5,000 brick, the result of four weeks' run of the mill. They are annoyed with the freezing of their water pipes, but expect to keep their stamps going all winter. Twenty men are employed in the mine and mill.

Cement Mining.—Brown Brothers, of You Bet, cleaned up on Saturday, after nine days' run of their mill, $5,000. They employ 12 men in their drift, and seven in their mill. The expenses are $500 per week.

PLACER COUNTY.

Evening Star.—*Herald*, 8th: The last crushing of rock from this mine yielded equal expectations. The gold has been sent below, and the returns are not yet known; yet we may mention that over 330 ounces of melted gold were obtained out of 28 tons of quartz, estimated at $6,000. This is exclusive of the sulphurets. The rock was worked at the Green Emigrant mill. The first crushing yielded $256 to the ton, the second $50, and this last about $220.

Bear River Ditch.—The water was turned out Oct. 1st, and the channel has been cleaned and enlarged. The water was again turned in a short time ago, but owing to the dryness and coldness of the weather, Bear river has not furnished enough water to fill the ditch.

SIERRA COUNTY.

Poverty Hill.—Cor. of *Messenger*, Jan. 8th: The Gold Valley Main Tunnel Co. have sold one-half of their capital stock to Messrs. Judson, Woodman and Doe, of San Francisco. Operations have been commenced to push the tunnel ahead. They have erected a powerful water blast. They will work three shifts. It is supposed that 600 feet will carry the tunnel into the bed of one of the finest gravel deposits in Northern California. The parties have located a timber ranch covering 16 square miles, on which they intend to erect a steam sawmill, and a sash and blind factory.

Kingdom & Bros. intend to run their water ditch into Slate Creek next summer. This ditch will be capable of carrying 2,000 inches of water. They will employ 300 Celestials.

Westall & Co. are working days, nights, and Sundays, driving their bed-rock tunnel ahead, which has already been 10 years in running, and will take about two more. It is now 1,500 feet in length.

Rich Lead near Forest City.—Michael Redding, after about four years tunneling near Forest Hill, struck the blue lead January 6th. It is believed to be the continuation of the Live Yankee and Oregon leads in Bald Mountain, of which he was also the discoverer. The ground pans out from $1.50 to $8 per pan. The discovery caused great rejoicing in Forest City.—*S. F. Bulletin, Jan. 11th,*

SISKIYOU COUNTY.

French Gulch.—Yreka *Union*, Dec. 31st: The rock from the Washington is yielding $75 to the ton in the new tunnel. The Highland is running on richer rock than ever. A new ledge called the Honeycomb prospects favorably.

Rich Rock,—A pound of rock from a claim at Cottonwood, was pulverized in a mortar yesterday, no gold being visible. It yielded $3.18.

Items.—Marysville *Appeal*, 7th: J. A. Maxwell has discovered a gold-bearing ledge at the head of Shasta Valley, which prospected $6.60 per ton from the croppings, and 11 feet down $10.60. The ledge eight feet in thickness.

Specimens of quartz, from the Oro Fino, Scott Valley, are impregnated with fine gold. The ledge at the depth of 60 feet is 30 inches in width, and the rock will average $25 per ton.

A new mining camp has been established on the east fork of Scott river, near Callahan's Ranch, named Evansville, said to be equal to '49 in prospects.

TRINITY COUNTY.

Ditch.—*Journal*, 1st: Thomas Hayes is bringing a ditch upon a bar one-half mile above the ranch of Mr. Wallace, on Brown's creek. We are informed that he has obtained fine prospects.

Arizona.

Big Bug.—Prescott *Miner*, Dec. 25th: Parties inform us that several lodes have, of late, been re-located. The mill was running. A clean-up was made, after a run of five days, and those interested appeared well satisfied. On Wednesday, we saw at the store of Gray & Co. a bar of gold worth nearly $1,000, from Big Bug.

Walnut Grove.—Fred. Henry and others are preparing to work the Josephine mine. Other parties are anxious to buy the mine. We learn that the placer mines are doing well. Geuung's arastras were running.

Prospecting Party.—Another party is about to start to prospect the country north of Bill Williams' mountain. Many who went last summer are going.

Mining Region about Prescott.—J. M. Tiernan gives, in the *Miner*, the results of an inspection of the mines embraced in an area of forty miles square, lying east and south of Prescott. He made repeated tests of the rock in the various mines, and gives details filling more than two columns of the journal aforesaid. He concludes that, taking into account the agricultural as well as mining resources, the region named offers greater facilities for profitable mining than any with which he is acquainted. The *Miner* endorses him as reliable. We give some of Mr. Tiernan's figures: The Eugenie vein yielded by mill process $112 per ton; the Badger ore, from the surface, $92.32; the Justice, $112.37, at a depth of 30 feet. These are in the Big Bug district. In the Goodwin district, the Galena vein yielded, from average rock, $86 per ton; the Dividend, $214; the Independence, from $80 to $200; the Ticonderoga, $90. On Lynx Creek, the Pointer lode yielded from $132 to $210 per ton; the Eureka Hill, from $60 to $120; the Box Elder, $94 at the surface, and $312 in other average rock; the Pine Mountain, $89.60; the Monitor, $30 to $100; the Accidental, $182 to $312.

Colorado.

Mining Items.—Georgetown *Miner*, Dec. 30th: Stewart ships to-day a silver brick weighing 1,483.4 ounces, .715 fine, coin value $1,371.31, from Terrible ore, treated in the old mill....The patent for the Terrible lode has arrived, the first for any lode in the vicinity....The Brown Silver Mining Co. ships to-day the largest mass of silver bullion ever produced in Colorado. The "button" weighs 683 pounds of troy, 8,196 ounces, currency value $12,703.... The Wilson & Cass Co's aerial railway is delivering ore at the rate of 20 tons per day. ....Work on all the tunnels is progressing; several of them have "struck it;" the Linn has cut the Equator on its eastern extension, with a heavy vein, and considerable mineral. The Baltimore is driving ahead. ....We were shown a button of gold retort weighing 10 dwt. and 5 grains, from 1½ pounds of ore from the Shaffter lode.

On the Mountains.—Lincoln tunnel heading is in 300 feet. The Albro is a true fissure vein, and has been explored on the surface for three miles....The Par tunnol will be driven to the lode this year. Work is to be commenced immediately....The McAfee tunnel is 185 feet. The height is seven feet, and the floor is six feet wide, and the cost has been $2,000. It has already struck a vein which yielded selected ore assaying $219 per ton. It will reach the Murley by July 1st. Selected ore from the Murley assays $349.

Terrible Mine.—Central City *Herald*, Dec. 29th: It is proposed to concentrate the third class ore, making it worth $300 per ton. There is probably 2,000 tons at the mine. Work in the tunnel has been suspended for the present.

California Lode.—A lot of Cornishmen are working Hugel's claim, and doing well. Some of the ore has run as high as 16 ounces per cord. Stalker's mine is down 420 feet, and yielding ore which averages between 10 and 11 ounces. Joe Harper has just put up a whim. A. M. Jones made a contract with some Cornishmen to sink a shaft on the Hidden Treasure, to pay for three-fourths of one hundred feet. They got through in nine months. The ore now coming from the mine pays seven ounces in a stamp mill, and yields a good quantity of smelting ore. Another lot of Cornishmen are working on the lode east of Stalker's.

Nevada Items.—Potter & Holley are crushing from 10 to 14 cords per week of ore from the Forks lode which pays five ounces per cord. The ore is easily mined, and costs $35 for hauling and crushing, They have leased Bradley's mill, in Russell gulch, and will start up 12 stamps at once. B. C. Waterman's mine on the Fluck is down 400 feet.

The New Works.—Stewart's Silver Reducing Co. have commenced operations. The new mine is located on the east side of the creek. The capacity of the works will be from 20 to 25 tons per day.

Clear Creek.—*Register*, Jan. 6th: The Whale Co. has 50 tons of ore on the dump, which prospects well. The last lot reduced was second class, which yielded $100 per ton. A force of four men is at present employed. Mr. Thackara is mining in Hukill gulch, and running the Fairmount Co's mill with good results. Bar mining along the creek is about suspended for the present, owing to the cold weather.

Bullion.—The gold shipments for the last two days have been about $24,000. This is better than in any previous year during the same portion of the winter season.

Idaho.

Loon Creek Mines.—Correspondence of Helena *Gazette*, Dec. 30: Mining is dried up for the present, and we can hardly expect to do anything more until spring. Many have faith that we can commence again in February and have three months' work before high water. I am not sanguine. * * Watson, Lundy & Co. cleaned up $500 from a pit twelve by sixteen feet, and without cleaning any bedrock. I have been shown several cash accounts, and the clean-ups were from $25 to $325 to one string of sluices, ten hours' run, with four to seven men. The diggings are not expensive to open, being shallow. The miners committed a blunder in laying over the claims *en masse*. Many men would have wintered here and done some prospecting. There is a party engaged in running a tunnel into the bar on which the town is located.

Montana.

Blackfoot.—*New North-West*, Dec. 24th: On Dec. 14th a strike was made on Illinois gulch, one-half mile from Blackfoot City. Twenty claims were staked the night of discovery. As high as 10 and 15 cts. to the pan were found. There is 16 feet of dirt, eight feet pay-gravel.

The Cedar Creek Mines.—The same says: We have "interviewed" Mr. Cusson, who has been there. The new town is named Louisville, and is 74 miles from Missoula. It is the Bitter Root Range. The discovery was made by Louis Barrett and another Frenchman or two. They have been prospecting for four months, and three months ago opened the discovery on Cedar creek. They sunk a hole 2x6 feet 2½ feet to bed-rock, and panned out $248. They have since located 2½ miles above, where they are washing with pans. They endeavored to keep the matter quiet until spring, but in sending out for friends, the "strike" obtained publicity, and on the last day of November a party of stampeders left Frenchtown at seven o'clock in the evening. On the 12th, between 200 and 300 men remained there.

Mr. Cusson saw $5 to the pan washed out. If the reports are half true it is wonderfully rich. The ground is now laid over until May 15th, 1870. All the letters we have seen, all the persons who have returned, concur. The gulch is claimed to be a second Alder.

Strike at Cable.—For several months Messrs. Cameron, Aiken and Jacobs have been prosecuting a piece of work in the vicinity of the Cable mine. They sunk a shaft 93 feet on the Thomas claim, and then drove a tunnel along the wall rock 400 feet. On Dec. 14th, they struck a body of quartz, and have exposed a face of 18 feet, at a depth of 180 or 190 feet. The ore is of the same character as the Cable. Mr. Cameron is the Supt. of the Hanauer mill—20-stamp—now ready to crush. The tunnel is being enlarged, and ore will be delivered for reduction shortly. The shaft is only about one-half mile from the mill, the ore coming down hill. Eleven men are at work.

Lincoln Gulch.—Cor. of Helena *Gazette*, Dec. 30th: "We have seven or eight companies washing dirt with success. Several companies are taking out pay dirt for next season's washing, and others are preparing drift-timbers or blocking out their ground for operations in the spring. The lower drain ditch is completed, and the prospects are very flattering, the pay dirt being eight feet in depth and prospecting 20 to 50 cents to the pan."

Nevada.

COPE DISTRICT.

Elko County.—Elko *Independent*, January 5th: A gentleman who has made a tour throughout northern Elko furnishes facts: There are now six or seven districts organized. The developments around Cope continue encouraging. The ledges maintain their width as the depths increase. East of Cope, the Bruno district is attracting attention. The rock is turning out well.

The placer mines are one of the important features of the country. Rocking in the gulches is going on as far out east as twenty-five miles. A ditch four miles long has been constructed at Cope, carrying four or five thousand inches, which is paying well.

New Discoveries.—Late advices report rich silver-bearing ledges on the headwaters of Bruno river, twelve miles from Mountain City.

HUMBOLDT.

Lucky Miner.—J. F. Smith, who disposed of his interest in the Alpha, is the discoverer of a ledge reported far richer, located two miles south.

Railroad District.—About thirty people are wintering. It is a base metal country, containing large quantities of copper and lead. There is one ledge about twelve feet wide, of nearly pure copper. There is a movement on foot to construct a road from Elko.

Mountain Boy.—This ledge is being worked by Henley & Co., with the most satisfactory results. A quantity of the ore worked in San Francisco returned $70 to the ton in silver, and 40 per cent. in copper.

PAHRANACAT.

Bullion.—*Reveille*, 8th, We learned, yesterday, that seven bars of bullion, valued at $7,000, were brought from the works of the Hiko.

REESE RIVER.

Yankee Blade.—*Reveille*, 4th: We saw, to-day, the result of a working of ore which showed $510.12 of silver per ton.

Secret Valley.—The Corwin & Paige ore, worked at the Manhattan mill, two lots, gave these results: Assay of the pulp of the three tons, $520.74 per ton; assay of the pulp of the twelve tons, $557.66 of silver per ton. The sum of $8,254.14, as the gross product of fifteen tons of ore, is splendid.

Mineral Hill.—*Independent*, 5th: Ned Leonard brings choice pieces of ore from the representative mines. A specimen from the Austin ledge is worth $813 per ton. Ledge No. 4 pans out at the rate of $500 per ton. The Big Giant, Great Republic, Silver Queen and Star ledges rank first class.

Ophir Canon.—*Reveille*, 3d: The works of the Cambridge, formerly the Twin River, have been closed, and the Supt. took his departure for New York on Friday. The reason for stopping work on the Murphy mine of the Co. is not apparent. At the close of the mine by the Twin River Co., it had produced ore of the value of $800,000 in less than two years.

The same of 5th says it is reported that the manager thinks it will be necessary to substitute Chinese labor for white. It closes its article with these words: "Chinese labor is not the panacea for excessive wages, exorbitant prices and loose, ignorant management."

Bullion.—Same of 7th: By the stage for Argenta, yesterday, ten bars of bullion, valued at about $9,000, were shipped by Paxton & Co., seven overland to New York city, and the other three to San Francisco.

WASHOE.

Occidental.—Gold Hill *News*, 8th: The lower tunnel has 100 feet further to run to reach the regular pay chimney. The old mine keeps up its yield, and looks well. At the north end of the car track or adit level, a winze is being carried up to the bottom of the old St. George shaft for ventilation purposes.

Hale & Norcross.—The ore breasts at the 6th or lowest level continue looking well. The water is about drained out between that and the level above. No dividend will be declared before next month. The present ore yield is about 156 tons per day.

Crown Point.—The faces of the drift east at the 1,000 and 1,100-foot levels only show porphyry. The face of the north drift from the 1,000-foot level shows lively looking barren quartz.

Sierra Nevada.—The mill is running steadily, and supplied from the east body of ore, which is looking better than ever. Last Tuesday they made a clean up from 12 days' run, which yielded $5,450.

Gould & Curry.—Yielding 50 tons of good ore per day. The upper workings near the surface show improvement, and samples from the El Dorado section indicates a large deposit somewhere in the vicinity.

Yellow Jacket.—The usual quantity of low grade ore from the north mine being shipped per railroad to the mills on Carson river. The south mine yields about 200 tons per day.

Savage.—A cross-cut at the 700-foot level, 100 feet from the Hale & Norcross line, a day or two since, showed encouraging indications of something good, but it turned out nothing extra.

Belcher.—Yielding 50 tons per day; average assays, $40. Explorations at the lowest levels temporarily suspended, and work concentrated at the upper levels, where there is ore enough in sight to last for months.

Kentuck.—The satisfactory yield continues, principally from above the 700-foot level. The company have declared another $10 dividend.

Virginia Consolidated.—Work suspended at present, pending the action of the company as to whether deeper sinking or drifting west shall be in order.

Dayton Concentrating Works.—*Enterprise*, 4th: F. Birdsall & Co., owners, shipped to San Francisco, in December, 140 bars of bullion, weighing 9,241 pounds, and valued at $72,000.

WHITE PINE.

Weekly Mining Review.—*News*, Jan. 8th: The San Francisco bears have our mining interests bound for a term; but more productive mines will be opened by spring than they can carry, and then business will revive. The mines are all looking as well as ever, and the majority of them better than ever before. The smelting interest, in particular, shows an unusual activity. More furnaces are building than ever before, and mines carrying base ores are let on leases, to working men, who find the working of them highly practicable, without the necessity of capital to start with.

Bullion.—*News*: The shipment for the week is about an average for the past two months—$67,724.84. The *Empire* says: The Little Giant, Staples, Miller's, Little Treasure and Henderson mills have all been idle for repairs the greater part of the week. Still, our exports of bullion foot up $73,113.20, against $58,370.15 last week.

Items.—*News*, 8th: In the Aurora Consolidated, a fine body of exceedingly rich ore was struck on Thursday....A proposition has been made by Chicago parties to put up a 15-stamp mill on the Copper Glance for an interest....Incline on the California 170 feet down....Fine ore struck at depth at 18 feet on the Farewell. Assays as high as $600....Imperial is taking out large amounts of smelting ore....Chas. Kimball has leased the Vulcan.

Items.—*Empire*: Eberhardt now works 37 men. Both mills running to full capacity....Aurora South looks well. The tunnel is in 120 feet. Ore from it worked at Stanford mill, 743 tons, yielded $46,000 bullion....Original Hidden Treasure will not cease work on the mine until spring. ....Miner's Dream will commence shipping ore to mill this week.

Mills and Furnaces.—*Empire*: S. A Raymond's furnace will commence running on Monday.....Rathburn furnaces are to be rebuilt on a new plan....Van Wyck & Arrington are building a 5-ton furnace....Chicago mill is to start up to-morrow....Stowe's mill at Hamilton is crushing 25 tons daily.

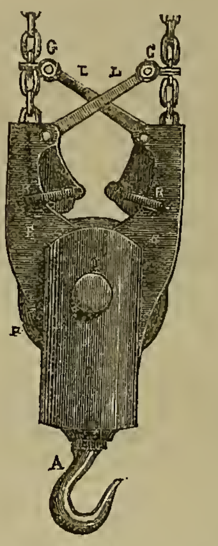
Outside Districts.—Shoshone ores work from $500 to $800 per ton. Two mills are ordered....Many new discoveries have been made in Kern district. The 20-stamp mill of the Steptoe is about to start up. Six thousand tons are on dump.... Silver Park is to have another mill. The Patterson mill is to be moved there.

Eureka.—The *Alta's* correspondent says the Eureka ores assay up to $700 per ton. None have been reduced that did not assay $500. The district surpasses everything for richness and amount of ore, and is attracting much attention.

Safety-Hoist.

The many accidents which are continually occurring, caused by the breaking of the chains or cables of hoisting apparatus, and often occasioning the loss of life, render necessary the use of contrivances by means of which the evil results may be prevented as far as possible.

The number of such inventions are legion, and many of them are known to our readers. Among others, a Mr. Caron, of Paris, has invented an apparatus for preventing the fall of heavy materials in case the chain or cable by which they are suspended should break. If the inventor's speculations are realized, it will be a valuable advance, especially as guide-rods are not necessary, as is generally the case with most safety-hoists. It has been suggested that it might be applied to cages of mines; but we think that there are many other inventions better adapted to this purpose. A description of the apparatus appeared some time ago in the London *Mining Journal*.



A is the hook; C, the block, with two lugs cast on it, forming the arms, B B; P, the pulley; M M, movable jaws, having on their exterior surface the imprint of the cable or chain; R R, springs, tending to draw the jaws toward the arms, B B; L L, levers fixed to the jaws, M M, and terminated by friction rollers, G G; O, the axle.

Now, as long as the chains are sound, the levers have the position shown in the cut; but if one breaks, as the right-hand one, the corresponding lever falls, and the left hand jaw, M, is drawn back by the spring, locking the left-hand chain against the arm, B. In this way the weight is kept suspended, instead of falling, the left-hand chain holding up the load.

◆

Pacific Coast Almanac.—We have received this pamphlet, which contains a large amount of valuable information and interesting statistics. It contains the 13th, 14th and 15th constitutional amendments; various U. S. laws with regard to mineral lands, homesteads, etc.; California laws on similar subjects; officers of the U. S. and of this State; rates of foreign postage; statistics of the Pacific States and Territories; Pacific coast railroads; and a great variety of other matter of more or less application. The compiler is Mr. H. G. Langley, whose qualifications for the work need no comment.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

San Francisco Prices of Copper Ores.

San Francisco, Jan. 14, 1870.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

◆

Monopolies.—The worst feature that we have to fear in the immediate future is monopoly. A great and rapid change is taking place in the manner of doing business, which facilitates monopolies, "kings," "corners," and dishonest gains by wealthy speculators. The great increase of newspapers, railroads, telegraphs and paper money, render possible quick and successful combinations to speculate on the gains of honest laborers, who, by the exercise of mind or muscle, produce everything of value. If we read the signs of the times aright, we have only seen the beginning of this kind of robbery. We say robbery, for, directly or indirectly, sooner or later, every dime of the millions made by gold, stock, whisky and other rings, comes out of the earnings of the producing classes. We are determined to lift up our voice like a trumpet, to cry aloud and spare not these *monstrous monopolies.—Truth.*

◆

Gone for More Money.—They tell us that David E. Buel has gone to Europe with a view of raising English capital for the mines of Eureka district.

Book on Earthquakes.—A Treatise on Earthquake Dangers, Causes and Palliatives, by Prof. Thomas Rowlandson, comprising Earthquake Dynamics; Earthquake Waves, Sound that attends Shocks, Lime, Mortar, etc., Cosmogony and Seismogony, Phenomena of the Neapolitan Earthquake of 1857, and General Observations respecting Structural Arrangements. Published by Dewey & Co., Scientific Press Office, San Francisco, 1869, containing 96 pages. Price, 50 cents, postage free.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Encouragement for California Invention and Agriculture.

Mr. Perkins, of Butte county, has introduced a bill in the Senate, which is reported as follows for the Sacramento *Union:*

> By Mr. Perkins—An Act for the encouragement of agriculture and the invention and construction of a locomotive steam plow, appropriates $10,000 from any available fund in the treasury to be paid as a reward to the inventor of the best locomotive steam plow, provided such plow be of practical utility; application to be made to the Governor, who shall publish such application in three newspapers; the Governor to be Chairman of the Board of Judges on the merits of such plows, and to appoint as the other members of such Board the President of the State Agricultural Society, the President of the San Joaquin Agricultural Society, the President of the Mechanics' Institute at San Francisco, and one prominent practical farmer.

From our intimate acquaintance with the inventions of steam plows in this State, and the wants of the farming districts for cheaper modes of cultivation, we can heartily recommend the passage of a well-guarded bill of the above description. We are confident such encouragement will be sure to develop a practical and entirely successful machine, or machines, which will be hundreds of thousands of dollars in wealth to the State, and alleviate in a great measure the dire necessity of an influx of cheap laborers.

No other country in the world affords such endless fields with soil and surface so favorable for cultivation by locomotive steam plows, and to the observant engineer and progressive mind it is clear that the time must come when millions of acres will be tilled on this coast by steam machines of either local or foreign invention. Our seasons are such that we need rapid plowing, in many instances; some soils—and some of our richest and most durable lands, too—cannot be broken up by animal power with the common plow, while it is plain that they can be cultivated quite profitably by the aid of steam.

Were there one-half the demand for such machinery for similar lande in Great Britain, there is no doubt that that country would have long since furnished us scores of imported machines ere this, as her capitalists have for many years lavishly patronized the skill of her inventors and mechanics, until they have hundreds, if not thousands, of steam plows in operation, suitable to the peculiar wants of her soil and limited fields. Such machines, however, are not of a style or capacity suited to the requirements of the broad ranches of California, or her easily cultivated plains.

It is not for the lack of competent inventors that our fields are not already cultivated by steam plows. The want of capital to properly construct such machines, and place them in the field, is, and has been, our need for years. It has not been popular, or, to any considerable extent, profitable, to invest money in either machines or manufactures in this State. Capital has been enticed through the gilded portals of more *promising*, but perhaps less *paying* channels. Let the Legislature pass this bill, and encourage home invention and manufactures. It will be a paying investment for the State, and prove a satisfaction to any member who votes for it.

The Farmer's Gold Mine.—A correspondent of the *Western Rural* (Chicago) says that every farmer may have a *gold mine*—one that will average better dividends than any thing in California; and after leading his readers through sundry labyrinths of speculation, brings them at length to the—*barn-yard.*

Cattle from Texas.

Shipping coals to Newcastle has long been a proverb expressive of the height of commercial folly. Bringing beef cattle from Texas to California ought to be made equally as great a piece of foolishness. The very fact that such a speculation can be made profitable bespeaks a most lamentable degree of improvidence somewhere. The idea of shipping beef cattle from Texas, thousands of miles, across barren and arid deserts, while millions of acres of the finest pasturage land lie idle in this State, is absolutely preposterous. There is certainly something wrong somewhere, or such business would be impracticable.

We have had no droughts—no famine of grass, that has induced this movement. It has become a regular business, year after year. But what if we *should* have droughts; can no provision be made? Have our cattle-growers never heard of root crops being raised for cattle? Ample warning is always given, even in our driest seasons, for the fullest provision of that nature. But we fear that just there is the rub;—too much toil is involved. Our people have learned idleness from the old Spanish rancheros; there is too much dependence placed on the spontaneous production of nature; stock must be left to take its chances—starve, if it cannot pick up its sustenance in the open, uncultivated fields.

Beef thus raised, and of a quality miserably poor, commands a higher price to-day in San Francisco than can be obtained for the best stall-fed beef in any other market in the world. With judicious management, we verily believe it would pay, at present prices, to raise beef for this market, if every pound of food, the year round, had to be manipulated and fed out to the animals by hand! In Rhode Island, beef is raised to a profit, where cattle are stall-fed nine months in the year—better beef than is ever seen in this market and sold at a lower price; and that, too, on farms that would not be considered worth holding in this State.

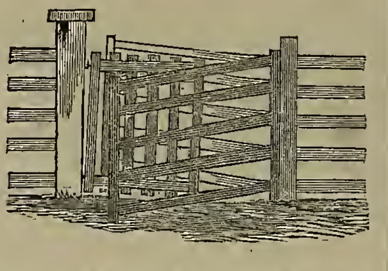
Californians have certainly got something to learn in the way of management—not only on the farm, but in the counting-house as well, if they would prosper, or even hold their own with the older States. There is a lack of economy, or a want of providence, in the management of all kinds of business in this State, which would work absolute ruin in any other part of the Union. If we continue to go on as heretofore, it will take all our gold and all our wheat, and more too, to pay Chicago men and other outsiders, for what we eat, drink and wear. The railroad has brought thither hordes of spies, who have found out our weak points, and who will pretty effectually wind us up, and put men of their own stamp in our places, if we do not introduce a similar degree of economy into business that they would bring.

Beech and Maple Trees.—Rev. J. L. Parish, of Willamette, Oregon, according to the *Farmer*, has recently received from Michigan a large lot of beech nuts, which he will plant the present season. This is thought to be the first importation of beech nuts for planting on this coast. He also received at the same time some black walnut and sugar maple trees. It is said that there are but two sugar maple trees in Oregon. This tree might no doubt be profitably cultivated for sugar in the mountainous regions of this State and Oregon.

Cattle Fed by Clock-Work.—A labor-saving Yankee in North Haven, Conn., has rigged up in his barn some hoppers having drop bottoms, in which he places the provender for his cattle, and has attached an alarm clock thereto. By this means the animals may all be fed at once, and at any desired hour. He sets the alarm accordingly, and gives himself no further trouble.

A Convenient Gate.

We give herewith an illustration of a plan for a very convenient gate—a small gate for a barnyard or any other locality where a passage way is much used, and where it is inconvenient to open a latch gate, or draw back one already closed by a weight, or where economy in room, or appearance is of but little consequence. By reference to the engraving, it will be seen that the gate swings in a <-shaped inclosure, the two sides of which are fixed. By having the top hinge a little the longest, as shown, the gate, when at rest, will always hang in the center of the angular inclosure. When a person desires to pass, a slight pressure swings it a little to the opposite side, while the passer moves in to near the apex of the triangle; by another slight pressure in the opposite direction, he is enabled to pass round the end of the gate, and so on into the field or area beyond, while the gate, by its own weight, after a few vibrations, again finds its rest in the center. If any animals attempt to pass, their approach and pressure effectually closes the gate against their egress or ingress; not even a sheep can pass such a gate. It is always shut, and always open to man, and much more convenient than the ordinary turn-stile. It requires no watching, and is not patented. This gate is in use in some of the Western States, and was figured and described in the *Rural New-Yorker* of July 3d.



Deep Plowing an Ancient Practice.—An agricultural paper, in discoursing upon deep plowing, thinks the practice has the recommendation of antiquity, as "we read in the sacred writings, when the prophet Elisha was plowing with twelve yoke of oxen to *one plow;* which circumstance leads to the conclusion that the necessity of deep tillage was understood in that age as we have not understood it in this country." The article concludes with the remark that "when our people fully comprehend the true system of the cultivation of the soil, they will be more disposed to use three and four-horse plows than one."

Hearth and Home, in speaking of deep plowing, says that "it is many-sided, as most questions are; but that a definite rule can be made that shall apply to all seeds, all sections, and all soils, is to us a matter of doubt."

Apples in Alaska.—There is a variety of apple which is cultivated in large quantities in the vicinity of Sitka. It looks much like the common crab-apple, and is about the same size. Why would not some of our early varieties, which ripen in June, or early in July, requiring but a very short time for maturing their fruit, do well in Sitka—better than those now raised there? Potatoes are also raised to some extent in and about Sitka. They are very small, however, and poor in quality. Peas ought to do as well there as any green fruit; but we are not aware whether they have been tried. Considerable attention is beginning to be paid to gardening in that region. Its possibilities in that direction are by no means known as yet.

Fences.—It is estimated that more money is invested in the United States in fences than in building—a very important consideration in connection with the discussion of the fence question in this State.

Decline in Wheat Production.

The Commissioner of Agriculture, in his late report, makes special mention of the fact that the noticeable decline in the yield of wheat is removing the center of production rapidly westward, thereby increasing the cost of transportation to the manifest profit of railroads. Thus wheat growers are reaping the fruits of their own improvident husbandry, and suffering loss and extortion from the accident of location.

The same fact is beginning to be alarmingly apparent in this State; and if not checked by more careful tillage, the great bulk of our wheat production south of San Francisco will soon come from the lower San Joaquin Valley, with three or four times the cost of transportation. If the price of wheat was regulated by home consumption, the farmer might charge the additional cost of transportation to the consumer; but, unfortunately, the cost in San Francisco being regulated by the Liverpool market, that increased expense must come out of the farmer.

A San José farmer, in the *Mercury*, admits the "decline," but thinks that neither manure, nor straw, nor tillage, will help the matter; that all lands decline in their yield of wheat as they grow old. He adds:

> Here, then, is an important subject for the scientific and practical farmer, as well as the philanthropist. What manure or what compost—what chemicals, or other matter or substance, will reproduce this virgin or wheat-producing property in the soil? The man that discovers it, if its use is not too expensive, will be entitled to a better monument than Vanderbilt.

Practically, there is no limit to the production of land which is cultivated on correct principles—rotation of crops and restoration to the soil of those elements of fertilization which are removed by successive crops. This is proven in the constantly-producing powers of market gardens. It is also proven by the uniform yield of the wheat and other fields of those parts of Europe where agriculture is carried on as a science. It is proven by the valley of the Nile, which is as fertile now as it was in the days of the Pharoahs—kept so by the fertilizing elements spread upon it by the annual overflow of its wonderful river. The wheat lands of Vermont are as productive now as they were fifty years ago; although within that time new lands have been opened and worn out by improvident cultivation, all the way from the valley of the Genesee to that of the Miami. The exception in Vermont is due solely to careful and intelligent cultivation.

Very little land in California, beyond the immediate suburbs of this city, is cultivated with any degree of care. The most of the land in this State is only *scratched*—not *cultivated* at all. There is no doubt but that a reasonably careful cultivation of our depreciating wheat lands would bring them up to near their original standard; at least it would pay better than the large and loose system now practiced. We want smaller farms, more careful tillage, and diversified crops. Rotation, fallowing, plowing in green crops, together with a free use of soluble phosphates, gypsum, etc., will work wonders in California lands. If our farmers will only experiment a little in this direction, they will be surprised at the results attained.

Plant Peas Deep.—The theory recently advocated of planting peas very deep in the earth, in order to prolong the bearing capacity of the vines, has been well tested and found to be correct. A farmer plowed a furrow beam deep, then scattered the seed peas at the bottom, after which he turned a deep furrow upon them with his plow, covering them to the depth of twelve or fourteen inches. They pushed their way up through the thick mass of earth very soon, and instead of turning yellow at the bottom, and dying after the first gathering, they blossomed and bore until he was tired of picking the pods. If such a result will uniformly be realized from the plan, pea culture may be more profitable than hitherto.

Wool-Growing in California.

Wool-growing in California has become one of the most important resources of the State, although it is as yet in its infancy: Beside the large amount required for our home manufactories, the shipments of wool to the Atlantic States forms an important item in our exports, and California wools have already become an article much sought after by Eastern manufacturers, as being peculiarly well adapted to the manufacture of carpets, flannels, blankets, and "business suits."

The experience of those who have engaged in the raising of sheep on this coast has been uniformly favorable—indeed it is now almost universally pronounced the best business in the State. It has less drawbacks and risks than any other, and can only be overdone when our flocks are so numerous as to consume all the food which our plains, valleys and mountains afford. There is no more danger that the supply will be in excess of the demand within the present century, than there is that our gold and silver will go begging for takers; for we have the whole world for a market. The man who makes a shipment of wool to New York can draw against it with as much certainty that his drafts will be honored, as though his shipment consisted of bullion. All that California can produce will be as but a drop in the bucket towards the world's supply.

Advantages in California.

In the Western States and in New England wool-growing is also considered profitable; yet in those sections it is necessary for the growers to spend a large portion of the summer season in raising hay, grain and roots to feed their flocks in the winter. To this labor must also be added the expense of dealing out the feed, the cost of shelter, and the losses inevitable from the inclemencies of northern winters. And yet, with all these drawbacks, farmers there get rich by raising sheep. After reciting the above facts, there is no need that we should enumerate the advantages which California possesses over the Eastern States for this business. Experience has shown that a flock of sheep in this country will double their number annually, such increase being largely in excess of the increase at the East.

An Important Consideration.

The fact of the profit on the business being apparent under almost any circumstances, should not encourage a person to go into it hap-hazard. Like all other callings, its inception and management requires some degree of thought and attention. The wisest course is to commence with the finest breeds. It costs but a trifle more, at the outset, to provide for an improvement in the increase, than it does to increase your stock with a growth of *scrubs*. If care is taken in this particular, when your flock becomes large it will be twice as valuable as where common stock is raised. This, however, like the whole subject of wool-growing, is so self-evident that only this mere reference is required.

What is Needed.

The present decrease of fine broadcloths for gentlemen's wear, and the general demand for "business suits," has created a great call for medium wools—the product of mixed breeds. Crosses between the various long-wooled sheep of Europe and the Eastern nations and with our native breeds, seems to be what is particularly needed at this time. Wool from such stock is most saleable and profitable. Crossing Southdowns with Cotswolds, Texels, Leicesters and Lincolns has been found most excellent in practice in this State for the production of the better grades of wool.

The Southdown and Lincoln on the Cotswold, gives a most excellent breed for profit, either in wool or mutton.

The Texel is better to cross with the Merino—it being especially a mutton sheep; also giving length to merino wool and size to the carcass. The pure French Merino furnishes a wool rather too fine for dealers at the present time. As a general thing, the mutton of coarse-wool sheep is preferable to that of fine.

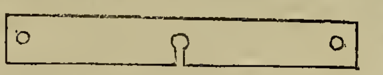
Where to Look for Information.

The importing and raising of choice breeds of sheep is becoming an important business in California, and is conducted with a degree of intelligence and care and a disregard of expense which augurs well for the future of the wool interest on this coast. One of the firms most extensively engaged in this business is that of Butterfield & Son, whose principal ranch is located on the San Benito creek, Monterey county, some thirty miles southerly from Gilroy, on the New Idria road. This firm—formerly Landrum, Butterfield & Son—has now a large flock of choice breeds of sheep, consisting of Cotswold, Texel, Leicester, Lincoln and Southdowns, the original stock of which was all imported, and which they are inter-breeding with great care. They are also receiving frequent importations of pure breeds from abroad.

The firm has long been supplying ranchmen in different parts of the State with choice breeds for stocking their farms. They have also a ranch stocked exclusively with goats, some 1,800 in number, in Peach Tree valley, about forty miles southerly from their sheep ranch. This stock consists of the common goat mixed with the Cashmere or Angora. They received 100 pure Cashmeres by last Pacific steamer, direct from Angola, on the borders of the Black Sea. Persons desirous of entering into the sheep business, or such as are desirous of improving their present stocks, will do well to communicate with Messrs. Butterfield & Son, whose post office address is "Hollister, Monterey county, Cal."

For Tree Planters.

A correspondent of the *Rural New-Yorker* sends that paper the following very useful plan for setting trees in straight rows after the ground has been properly staked off: In order to dig the hole the stake has to be removed, and if the hole is large it becomes difficult to tell just where to set the tree without sighting both ways. This can be obviated by using a piece of board, six or eight inches wide and five or six feet long, with an open slot in the center and a hole in each end, as shown in the engraving. Before digging the holes, take this board and place it on the ground, with the center hole around the stake where the tree should stand; then drive two small pegs through the holes in either end of the board. It may then be removed until the hole is dug, and placed back again when the tree is to be set. Place the tree in the slot or notch, which will not only determine its position, but also serve as a support to hold it in its proper place while the earth is being filled around it. This is a great labor-saver to those who take pride in having their trees in straight rows.



Southern Pacific Railroad.—The Secretary of the Interior has suspended the order restoring the lands withdrawn for the Southern Pacific Railroad, for the present, in accordance with petitions from various quarters.

The egg product of this country is set down at $250,000,000 in value. This would give about 270 eggs a year to each inhabitant. Rather a large figure, but not much out of the way.

There were 251,000 pounds of apples taken to Stockton last year. Value, $4,530.

Utilizing Smutted Wheat.

[From the Willamette Farmer.]

"The Willamette *Farmer* says that smutted wheat can be made into good and wholesome flour by adding one quart of finely-pulverized air-slacked lime to each eight bushels of grain, and thoroughly mixing it before it passes through the cleaning apparatus of the grist mill previous to grinding. The lime seems to cut the smut which adheres to the smutty end of the wheat, and is blown out with other dust and dirt. If this is a fact, it is new to us, and is well worth the attention of the farming community everywhere."—*Scientific Press.*

We assure our contemporary *it is a fact.* As one of the farmers in Oregon, when smut made its appearance here, we had some disagreeable experience with the filthy pest. The first means used to get it separated from wheat designed for bread was, by repeatedly passing it through the fanning mill with all the speed and wind that could be given by man-power; by so doing, nearly all the smut hulls that remained unbroken would be blown out with the light and inferior wheat, but when grain so cleaned was made into flour, the bread made therefrom created an uncomfortable sensation in persons of delicate stomachs. We then resorted to washing the wheat, in order to get bread grain, as there was very little raised entirely free from smut. It was found that washing smutted wheat at the head of a spring brook within the home lot, killed the trout it contained as effectually as if the brook had been limed. At the same time, the oats of the country were very generally smutted also, and many valuable work-horses were lost, mainly poisoned, as we believe, by eating smutted grain. Where the idea of mixing air-slacked lime with wheat in order to clean it, originated, we do not know; but an old gentleman named Hawkins, who attended the Salem grist-mill at the time smut was most troublesome in Oregon, was the source of information. We tried the remedy, repeatedly, and it never failed. We resorted to the practice of mixing a small amount of air-slacked lime with the grain, as it was put away in the granary, and found it to answer the same purpose, in one trial, which was all we had occasion to make, as the use of vitriol in solution, in preparing seed-grain, as a preventive, proved so effectual as to render the lime unnecessary.

Lime is a good article to use about a wheat bin on other accounts than to kill smut. It is a good preventive of rats. Sprinkled liberally over the top of the wheat, rats do not find it very comfortable to work amongst.

Roots as Feed for Stock.

A correspondent of the Willamette *Farmer* writes as follows, with regard to the field culture of turnips as food for stock: "Hearing the question frequently asked whether root crops, such as turnips, beets, etc., would pay to raise for winter food for stock, I will give you one small experiment of mine: Having a small corner of land under fence, thickly set with grubs, and having a goodly quantity of logs and other rubbish, last spring I proceeded to clear and prepare said land for the plow. I plowed and harrowed in the spring, and after the vegetation was pretty well up I plowed and harrowed the second time. Then, about the first day of July, I plowed and harrowed the third time; sowed, broadcast, white turnip seed, and ran over with a light brush. We have just gathered the crop. The result was 250 bushels from three-fourths of an acre of land. There were but few gathered weighing less than one pound each—the largest weighed 19½ pounds. The above result was without manures or irrigation."

Dairying.—The Lower Lake (Lake Co.) *Bulletin* says: "Although dairying is the best business in the country, the farmers generally eschew it, and prefer to raise their fifteen or twenty bushels of grain to the acre, and pay out two-thirds of it to get the other third in market."

Rent for Farms.—Seven to ten dollars per acre per annum rent for wheat land is quite common in California; and now we hear through the reports of the Clerk of the Board of Swamp Land Commissioners that land on Sherman Island is rented for from ten to fifteen dollars per acre.

Stockton shipped in 1878, 350 tons of grapes.

Shrinkage in Slaughtering.—The shrinkage of hogs in butchering varies from one-eighth to one-fourth of the gross weight. A well-fattened hog that has not been fed for sixteen or twenty-four hours before slaughtering, and will weigh 300 pounds gross, will weigh about 260 pounds dressed, while one poorly fattened that will weigh 200 pounds gross, will balance little over 150 pounds dressed.

It is believed that hogs that have attained maturity, or about twenty months old, when well fattened, will shrink less than those that are from nine to twelve months old.

Beef cattle will, on the average, shrink about 40 per cent. in slaughtering—*i. e.*, the meat will equal nearly 60 per cent. of the gross weight.

In the case of both cattle and sheep, much depends upon whether they are well fattened; and some breeds, as Short-horns and South Downs, show less shrinkage than others.

Artificial Hay Making seems to be gradually working its way into use. Alderman Mechi writes to the London *Times* that he shall hereafter arrange to make his hay by furnace heat. The apparatus consists of a coke furnace, and a fan by which the heat is driven through a small chamber filled with grass. In fifteen minutes the grass is converted into hay, sweeter and greener than can be made by sun-drying. The apparatus works in all weathers, and dries grain, corn, and roots as well.

Egg Oil.—Accounts are given in some foreign journals of the healing properties of a new oil. It is easily made from the yolk of eggs, and is said to be much employed by the German colonists of South Russia as a means of curing cuts, bruises, scratches, etc. The eggs are boiled hard, the yolks removed and crushed, and then placed over a fire and stirred carefully till the whole substance is on the point of catching fire, when the oil separates and may be poured off. Hen's eggs are considered the best, and nearly two spoonfuls of oil may be gained from a single yolk.

A Novel Farming Association.—Some of the Canada farmers have struck a good idea: they have formed themselves into seed clubs, each one to raise choice seed of some kind for the rest of the members.

Swallows take all their food on the wing, and one will take more than 2,000 flies or mosquitoes in a day. If so cold that flies cannot rise from the ground, the swallows will continue flying till they die for want of sustenance.

To Lengthen a Colt's Tail.—Nothing better can be done to increase the length of a colt's mane or tail than to keep the roots of the hair perfectly clean, and to frequently comb and plait it.

C. H. A.—Your reply will appear next week.

McKenney's Sacramento Directory for 1870 has just been received, and the publisher is to be commended for the style in which the work is done. It shows a very pleasing improvement in the city over former years, and denotes a growing prosperity. The population is estimated at 24,640; the taxable property at $8,221,628, or $336⅔ per head—a high average, especially as the estimated population probably includes the class denominated as "floating." The value of the street improvements in 1869 is given as $86,213.09, and the increase of the value of taxable property over 1868 as $2,657,812. The building of the State Capitol receives considerable mention as one of the events of the city. There is, moreover, in the volume, much valuable historical and general information pertaining to the place, which is doubly interesting, as showing the enterprise and industry of our western cities, even under the most untoward circumstances.

◆

Gas Works for Country Residences. We were shown this week the apparatus of the Pacific Pneumatic Gas Company, for the manufacture of gas for those who are not able to obtain city gas. The apparatus is very simple, consisting of a tank with a chamber-system, which is filled partly with gasoline, and through which air is forced by means of a common water meter. The tank being placed in the ground at any desired distance from the house, there is not the slightest danger of fire, insurance companies insuring, without extra charge, buildings where these works are used. We may in some future issue give a fuller description, with an illustration, to show the simplicity and ingenious arrangement of the whole apparatus. One of these has been used for several months at the Pacific Iron Works in this city, and others are to be introduced into the Deaf, Dumb and Blind Asylum, at Berkeley, into several private houses at Oakland, and elsewhere.

The "Bulletin" on Our Foundries.

A report on the condition of the foundries of San Francisco appeared in the columns of the *Bulletin* this week, and gave a very deplorable impression with regard to this branch of industry. The *general tone* of the article is to the effect that the whole business is "fast going to decay," that several of the large establishments have failed, and that the rest are so reduced that more failures must occur in a very short space of time.

In an editorial in another part of the paper a fairer statement of facts, as we think was made and one which contains much truth. Still the general impression left is disadvantageous to the industry, and many who will read the reporter's account, will omit to read the editor's remarks. It is to the *general* effect that we object; and this is, we fear, such that a person coming to the city with a large order would be influenced to go to Chicago, rather than to get his work done here. Facts are supposed to be given by the reporter; comments by the editorial.

We are rather doubtful whether it is fair to say that four "large" foundry establishments have failed, as among the four are some which could hardly be classed as "large," and, if we hit on the right works, one or two which are not foundries. Why was it not stated that quite a number of new machine shops have been started? We object also to the illustration given of the condition of affairs, nor do we consider that a "small boy" who "pretends to work on some castings at the farther end of a building," is exactly the proper authority for statements in a paper of such extended circulation and influence as the *Bulletin.* It certainly is contrary to the usual custom of that journal.

Some of the facts given seem to us to prove nothing, or, if anything, rather the opposite of what is stated. Taking the figures given in the article, the shafting and pulleys for the San José Woolen Mills would have cost at establishments here 14 cents per pound. They did cost at the East 9 cents. Add 4¼ cents for freight (according to tariff given) and the difference amounts to ¾ cents per pound. Now, before any case can be made out, we must be shown that the work was of equal quality, that the cost of running repairs was no greater than for work made here; that broken castings can be as easily replaced, etc. That work can be done at a cheaper original cost at the East than here, does not prove it economy to send away from home for it. In most cases, to state it mildly, of which we are cognizant, the Eastern work was of inferior quality to that produced from our establishments; hence the important item of repairs must be added. Again, old establishments often sell at a loss, for a time, in order to kill off competition, and for aught we know, this may have been the case in the present instance. English iron works have done this repeatedly, to keep the American market in their hands. We must take into account the trouble of sending so far away from home, the delay in getting the articles, and especially in replacing any part which may get broken, etc., etc.

We are informed by foundrymen here that they are ready to compete with Eastern prices. One foundry says that (as a particular example) they can *underbid* the scale of prices sent, with a quartz mill, to White Pine. Of course, inferior work can be turned out at a lower price than work of a good quality; but first cost is only a part of the total expense. In some things, the East controls the market here and is without competition, but with regard to machinery for many purposes, as milling, mining, etc., there is no comparison between Chicago and San Francisco work. They do not know, off there several thousand miles, what the necessities of this country are, and it is impossible to expect them, with their inexperience, to compete with our experienced workmen in making such machines.

The prices are falling, and will continue to fall until the equilibrium is established between the East and the West. This will make some difference still in the prices of machinery. But yet, as things are now and have been, we believe that no apparatus made at and imported from the East, has proved cheaper—taking into account all considerations of quality, time, trouble, ease or difficulty of obtaining duplicates of castings, etc.—than the same which is furnished here. And we have yet to receive credible information that any works have *continued* to import any considerable amount of machinery, except such special apparatus as is not produced on this coast.

We are willing to take a step into the future; and, judging from the prospects, venture to predict that we shall see, within twenty-four months, an amount of work turned out by our foundries which will leave far behind any amounts as yet produced.

◆

Utah Central Railroad.

This railroad from Ogden to Salt Lake City was completed on January 10th, on which day the last rail was laid and the last spike driven. Some twenty thousand people participated in the festivities at Salt Lake City in celebration of the event. A large number of church, civil and military dignitaries, Gen. Gibbons and staff of Camp Douglas, legislators and representatives from all parts of the Territory, and officials of the Union and Central Pacific Railroads, were present. Four bands furnished the music, and cannons thundered out the salvos. Brigham Young drove the last spike, which was made of Utah iron, and made a speech, being followed by various other orators. Congratulatory messages were received from different persons. In the evening there was an illumination and a grand ball in the theater, where a supper was provided by the city.

The general effect of the road must be to advance the material prosperity of the people. What its immediate result in the Mormon church may be, seems a little doubtful. While the Gentiles think that it will do away with the absolute authority of the Mormon President, as it must, sooner or later, Brigham sees, or pretends to see, in it, only a means of advancement in his views. Time will soon show a decided result. The people, at all events, are to be congratulated at the building of the road.

◆

Pisciculture.—Gov. Haight, in his message to the Legislature, recommended some action on the subject of "protecting the different varieties of fish in our rivers and mountain lakes, and stocking these waters with new varieties," remarking that "many valuable varieties of fish from Eastern waters could be introduced and multiplied at a small expense." In accordance with the suggestion, Judge Hager has introduced a bill, which provides for the protection of establishments for the propagation of the finny tribe.

We are sadly in need of some measure on this subject, that, before it is too late, the destruction of fish in our waters may be stopped. Having the experience of older countries before our eyes, it is to be hoped that we may benefit thereby, and thus save ourselves ultimate injury and expense. We see that at Lake Tahoe the wholesale destruction of fish is accomplished by means of exploding nitro-glycerine in the waters. We protest against this wanton waste. It must be impossible to recover all that are killed in this way, and it will take but a short time, by such operations, to depopulate our waters. No one should be permitted, for the sake of a small, temporary gain, to inflict such lasting injury on the whole community.

Cranmer's Automatic Volley-Gun.

A private trial of this ingenious machine was made last Saturday afternoon at Black Point, before Major-Generals Thomas and Ord. The inventor has been at work for a long time perfecting his apparatus, and is now endeavoring to introduce it to the notice of the military authorities, this trial being one of the steps taken for this purpose. The result was satisfactory in a high degree, although the nervousness of the patentee led him to show rather the weaker than the stronger points of his gun, which hardly had justice done it in one or two respects.

The gun is mounted on a pivot, which admits of its being moved around horizontally to any required point of the compass, while at the same time it can be elevated or depressed to an angle of 45° with the horizon. The chambers are bored into a solid steel cylinder (which revolves on a horizontal axis), thus preventing all danger of bursting at this place. In the model shown, there were three chambers in each horizontal row (and three barrels to correspond), although the number may be increased in any gun if desired.

The magazine is placed above the cylinder, and is divided into two funnel-shaped compartments—the one near the breech for the powder, the other for the balls. At the bottom of each compartment are tubes, which are in direct line with the chambers. As the cylinder revolves, the chambers come directly under the tubes of the first division, and are charged with powder, by a simple and ingenious arrangement, the charge being measured in any required amount and dropped into the chambers. These revolving to a position under the second compartment are charged with the ball in a similar manner. As the chambers pass on further, the balls are driven home by a roller which presses against the face of the cylinder.

The charges are fired by means of caps placed on nipples at the side of the cylinder, each cap exploding all of one row of charges. To effect this, there is a cylindrical box side of the cylinder, which, by an ingenious arrangement of springs and levers, caps each nipple as it comes into the required position. To the rear of the cap box is a hook, which removes any cap or part of a cap which may adhere to a nipple, while before it is a hammer which explodes the cap at the right moment. In the trial, the gun did not miss or hang fire a single time.

The barrels are held firmly against the face of the cylinder, their rear end being ground so as to fit exactly its curved surface. To prevent them from becoming unduly heated by the rapidity of the discharges, there is a tank of cold water around them near the cylinder.

The whole apparatus is automatic, and has many working details, which we have not the space to describe. By simply turning a crank, the cylinder is caused to revolve, the chambers are charged with powder and ball, the nipples capped and the gun fired, and the chambers swabbed out.

The gun must be terribly effective when used against masses of men. Some idea of this may be formed from the trial, where shots were discharged at the rate of 300 to 360 a minute, without the least forcing. The ease with which it can be handled, and its simplicity, rendering it free from liability to get deranged, recommend it highly. All that is required of the gunners is to fill the magazine, sight the gun, and turn the crank, which sets all the machinery in motion.

The inventor is Mr. T. J. Cranmer, San Francisco, Cal., who has obtained a patent for the United States, and also one for England, through the Foreign Patent Agency of the Scientific Press.

◆

The first work done at the Carson Mint will be the coinage of silver dollars.

Our Home Industries.

Chicory—Its Cultivation and Use.

Chicory is a plant belonging to the same family as the common dandelion, to which it is similar in nature. It is a hardy perennial, of easy production, and one which, if allowed to get a foothold in mowing fields, is hard to be eradicated, and becomes a troublesome weed. In rich, cultivated soil, the seed-stalks sometimes grow six feet high—stout, erect, and much-branched. The roots grow deep, especially when the soil is mellowed and dressed with manure. Any soil that will grow parsnips will readily produce chicory.

Its Mode of Culture.

The seed is usually sown in shallow drills, sixteen inches apart, and when well up, the young plants are thinned to three or four inches apart. The soil should be stirred frequently to keep down weeds. In due time the ground is covered with a thick, heavy foliage, eighteen to twenty inches high. When the roots have attained a suitable size, they are dug, thoroughly washed, sliced, and dried. If the roots are allowed to grow too large, they are apt to be woody in the center, and of little value. The seed is obtained from the second years' growth, the same as beets, etc. The roots are gathered just before the plant flowers, as they are then considered in their best condition for use.

Preparation for Use.

As soon as the roots are dug and washed, they are cut and sliced into pieces about an inch square, or a little larger, and dried in the sun or in kilns; the same as is done with apples, peaches, etc. In this condition it is roasted, like coffee, and ground up, sometimes with a portion of pure coffee—more frequently, perhaps, by itself, and mixed afterwards. It is usual, in grinding, to add about two pounds of lard to one hundred pounds of the dried root.

Its Use.

The only use of chicory is for the adulteration of coffee. It is added sometimes by the consumer, for the sake of economy, but oftener by the dealer, for the sake of dishonest profit. When used in small quantities—four to ten per cent.—it aids in settling or clarifying the coffee. It has long been used in France and Germany, where it forms, among the poorer classes, the chief ingredient of that beverage.

Soon after the commencement of the war of rebellion in this country, the price of coffee ran up to so high a figure as to render its use almost beyond the means of thousands who formerly enjoyed the refreshing and exhilerating effects of the genuine article. To supply its place, a great variety of substitutes were recommended and introduced, prominent among which was the article of chicory, which was then, and still continues to be, largely imported from Germany. Its use was loudly advocated by most of the papers throughout the country, on the score of economy.

It is said that the so-called "essence of coffee," now much in use, is chiefly a preparation from chicory, and that that article also forms a large portion of most of the packages sold throughout the Union as "pure ground coffee."

Its Effects, Chemical Characteristics, Etc.

Chicory is destitute of aroma, and does not contain a single particle of anything that forms an actual substitute for coffee. In the process of drying, grape sugar is formed by fermentation; and by the subsequent roasting, this ingredient finds its way into the cup as a solution of burnt sugar. The "bitter principle" which is found in the roasted root is chiefly due to this burnt sugar.

Its medicinal qualities are, to some extent, those of a tonic; in large doses, it acts as a mild aperient. Its use, in any considerable quantity, produces dyspepsia, flatuency, diarrhœa, heartburn, acidity of the stomach, and loss of appetite. As no serious injury may arise from its use, in small quantities, as an adulteration of coffee, it will, no doubt, continue to be employed for that purpose; but it should not be used too freely.

Home Production.

If we *must* use chicory, it is better that we should raise it home, and make it contribute to the prosperity of our own State. Messrs. Harris & Palm, near Washington, Yolo county, were among the earliest to engage in its culture here, having become familiar with the business in Germany. Some two years ago they were raising about one hundred tons annually from about forty acres of land. They dry upon platforms in the sun, having some 15,000 feet of permanent flooring which they use for such purpose. Chinamen are generally employed in the weeding, hoeing, and gathering of the plant. Quite a number of others in the same neighborhood are engaged in the same business, on a smaller scale.

The California Chicory Company

Are now the most extensive growers and manufacturers of chicory on this coast. They commenced operations about two years ago, their factory being connected with the sugar refinery on Branuan street. Mr. C. Spreckles is the President of the Company, Mr. Peter Spreckles, Manager, and Messrs. Kruse & Euler, on Front street, are the agents. The establishment of this company has entirely stopped the importation of the article into this State, and large quantities are now being shipped hence to New York, where there is quite a market for it, as it seems that a good article cannot be raised in the Eastern States; and, in consequence, thousands of tons are imported annually from Germany. The California article is preferred to the foreign—first, because the plant grown here is superior, and also for the reason that the Germans mix it with refuse beet pulp from their sugar factories.

The California Company are now manufacturing at the rate of about 500 tons a year, which amount will be largely increased for the coming season. They grow only a portion of the roots themselves, depending, in part, upon the farmers for their supply. The company have drying kilns in Contra Costa and also in the neighborhood of Half Moon Bay. Large quantities are raised by various farmers in Contra Costa county. A fair price is paid for all that is brought to the kilns of the California Chicory Company.

◆

Woolen Manufactures for the East. The Butte *Record* says that a gentleman engaged in a woolen mill in Connecticut has recently disposed of his interest there, with a view to starting in California. He will be in Oroville in May next, for the purpose of examining the advantages afforded at that point for a woolen mill. California should manufacture every pound of wool she raises. Our water power, railroad facilities, and wool resources, ought to make this the leading State in the Union in woolen manufacture.

◆

Nevada Raisins.—Mr. E. W. Barnam, of Nevada City, has been experimenting in the production of raisins from the Muscat of Alexandria variety. The *Gazette* says "they are quite large, and have the flavor of the best Malaga raisins without their toughness. The grapes were picked, and laid on the roof of the house, sloping towards the sun, where they were dried in two weeks. There is no reason why California should not produce all the raisins for home consumption on this coast."

◆

Traveling Agent.—Mr. Wm. H. Murray will soon visit Stockton, Sacramento and other places for the transaction of business connected with this paper.

Pacific Coast Inventions.

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending January 4th.

Collecting Gold from Ores.—August F. W. Partz, Oakland, Cal.

Lounge and Bed.—August Hauseu, San Francisco.

Rotary Steam Engine.—G. H. Pond, San Francisco.

Process of Preparing Coal for Smelting Ore.—William John Lyud, Golden City, Colorado Territory.

Using Colorado and Similar Coal for Metallurgical Operations.—William J. Lynd, Golden City, Colorado Territory.

◆

Notices of Recent Patents.

Among the interesting and important patents recently issued to Pacific coast inventors, the following are worthy of mention:

Combined Lounge and Bed.—August Hausen, S. F.—This is a very neat and ingenious mechanism, by means of which a handsome piece of parlor furniture may be converted into a bed, or series of beds, for quite a family. The seat of the lounge is made in two parts, and hinged, so that the upper half can be turned over to the front, and present surface wide enough for a double bed. To support the extended half there are legs, which, when not in use, can be folded up, and which, moreover, are slotted and provided with rivets and plates, which are so arranged that the legs are always steady, whether supporting the extended half, or when folded up. The plates and legs are sunk into the wood so that they are flush with it, thus obviating any danger of injuring the cloth covering of the lounge. The head piece is also formed similarly in two parts, so that it can be opened to the same width as the rest, forming a complete bed, while the covering of the lounge, being thereby turned to the bottom, cannot become soiled. The back is hinged to the lounge, so that it too can be let down, if desired, and a mattress placed upon it, affording an extra bed for a child. There is a box which slides in under the lounge, which is provided with a spring or other bottom, forming still another small bed, or it may be used as a drawer, in which the bed clothes can be placed when not in use. To many, such a piece of furniture as this will be invaluable, and, as the whole may be made as ornamental as is wished, it forms an article of furniture handsome enough for any parlor.

Rotary Steam Engine.—G. H. Pond, San Francisco.—This is a novel invention in an entirely new direction, which must attract the attention of all engineers to a careful consideration of its merits. The novelty consists, first, in so constructing the engine that water is introduced into the cylinders and then converted into vapor; secondly, in placing the cylinders at the point where the power is needed, namely: in the circumference of the circle in which they travel; lastly, in causing the cylinders to revolve in a bath of fluid metal, which serves as packing, piston and resisting surface, and renders the engine perfectly steam tight. The cylinders are placed within and near the periphery of a drum which revolves in a tank filled with hot fluid metal to about the height of the journals of the drum. Through a central hollow shaft, water is admitted to a cylinder, just as one end emerges from the metal bath, and is immediately changed into vapor by the heat. This end has a valve which is instantly closed by the pressure of the steam, which, as the other end is open and the cylinder full of metal, causes the drum to revolve until the open end rises above the surface of the bath, when the steam is free to exhaust. In the drum, there are four cylinders, two on each side, at right angles to each other, and thus it is kept continually revolving. The amount of effective pressure depends upon the specific gravity of the fluid metal used and the size of the drum and consequent depth to which the chambers are immersed. As the journals are subjected to a considerable degree of heat, it would be impossible to use ordinary lubricants; hence, plumbago is used, with a peculiarly constructed box. It will be seen from this description that the invention is decidedly novel, while, at the same time, it promises much in the way of advance over old methods. It certainly will repay those interested in mechanical matters to investigate the case thoroughly.

Collecting Gold from Ores.—A. F. W. Partz, Oakland, Cal.—This invention is designed in a great measure to effect an economy in the use of water, in regions where this article is scarce, and at the same time to more effectually collect the metals contained in the ores. It consists of a series of tanks or precipitating vessels where the gold is collected, and in a simple arrangement of pumps, by means of which the water from which the ore has been settled can again be used in the batteries. The invention has been described by us previously, under date of Oct. 16, 1869.

◆

New Invention.

The Jennings Car Brake.—Very many devices for car brakes have been invented, tried, and found more or less successful. The latest of these, and, it would seem, the best, is that of Byron Jennings, of San José. This improvement has been applied to one of the horse-cars on the San José and Santa Clara Railroad, and has, according to the *Mercury*, proved a complete success, and is surely destined to work a revolution in the construction of horse-cars. The object of the improvement is to obviate the immense wear of track and wheels in going around curves. This is accomplished by a division of the axles in the center, and by a double brake, made to brake the wheels of either side separately, or all the wheels together. By applying the brake to the inside wheels on a curve, the friction is taken from the flange of the outer wheels with the rail, which is always immense, and transferred to the surface of the inner wheels and brake. Thus the car swings around the curve naturally, and without the least liability to fly the track.

To test the matter, one of the shortest curves in the road has been made with the horses upon a run, a thing impossible to be done with an ordinary car. The curve tracks on the above road are made of white metal, almost as hard as glass, and very expensive. The difference in cost between that style of rail and the common rail that can be used with the Jennings improvement, would more than pay the cost of an application of the principle to every car on the road. A caveat has been filed on this invention through the Scientific Press office.

◆

Mechanics' Institute—Monthly Meeting.

The regular monthly meeting of the Mechanics' Institute was held on Thursday last, at which the President, Mr. Hallidie, stated that the Committee of Trustees, to whom was referred the reincorporation of the Society, had presented a new Constitution, By-Laws, and Rules and Regulations, and, by an unanimous vote, the same were adopted. The new Constitution differs but slightly from the old, but opens the membership to the public on a more liberal basis. By it the entrance fee is placed at one dollar, and the dues at one dollar and a half per quarter, and any non-resident is allowed the use of the rooms of the Association on the payment of fifty cents per month, in advance.

Mr. Hallidie also stated that the Finance Committee had been unable to finish their report in regard to the late Industrial Fair, but that its financial success would prove as large as had been expected; that $10,000 had been paid on the mortgage; $5,000 for accumulated interest, and they hoped to pay $10,000 more on the mortgage. They had also purchased a large number of books.

Mr. Hallidie then introduced Mr. Hubert Burgess, who continued his lecture on "Lineal and Perspective Drawing," which was listened to with great attention by a very large audience. Mr. Burgess was extremely happy in his mode of explaining his new system of drawing, which is fast winning its way to popular favor, not only in California, but elsewhere. These free lectures are becoming a decidedly popular and important feature of the Institute.

Running Cars with Compressed Air.

A New Orleans company is building apparatus for the application of condensed air on city railroads, which, they expect, will effect a revolution in the present state of affairs; for they claim that by it the expenses of running each car in that city can be reduced from $8 to $10 daily (the rate now) to not over $3. The New Orleans *Commercial Bulletin* gives the following description:

The idea is that each car shall have two cylinders, or tanks, to contain the fresh air, which is to be used as a motor. These cylinders are to be on the top of the car, and are to be charged at the depot by an engine worked with steam. 'Metallic cylinders were first tried, but they were found to be too heavy, and the difficulty of the company has been to find a lighter material available for the purpose. Paper cylinders have been determined on, two on each car. They are made of strong sheets of paper, laminated to a thickness sufficient to bear the great pressure required to contain the air condensed into steam. The several lamina are adhered with glue, and the paper fabric is strengthened with an envelop of cordage. In connection with these cylinders there is to be an engine, for which a special patent has been taken out, and which is otherwise valuable in its application to steam machinery, to receive the condensed air and rotate the wheels of the car.

One of the cylinders has been subjected to a trial of three hundred pounds to the square inch, and had not yielded. Three hundred pounds to the square inch would suffice as a motor. With a platform car, experimented on a street railroad with far less power than that, the experiment resulted satisfactorily. Two iron cylinders, weighing sixteen hundred pounds, were used, which leaked through the riveting. There were twenty-eight persons on the car. Starting with but ninety pounds of pressure to the square inch, and with the weight of cylinders and men mentioned, three miles and a half in seven minutes and fifteen seconds were made; and as to curves, when the motor was reduced to fifteen pounds, the car went around a street corner "as smoothly as a ball would roll on a billiard table."

* * *

ANNEXATION OF SAN DOMINGO.—For some time various paragraphs have appeared in the papers, relative to the annexation of this island by the United States. In the last Congressional session, General Banks was quite prominent in bringing the subject before the attention of Congress, and since then various rumors have been current up to the present time, when it is stated definitely that a treaty for the purchase of the island for the sum of $1,500,000 will shortly be presented to the Senate for ratification.

About a year ago, a New York company, who held a grant of mining lands in St. Domingo, sent out an expedition to that place, with Prof. Gabb at its head, to more fully investigate the resources of the land. It was since this expedition started that the annexation project seems to have assumed a live shape.

* * *

A PERPETUAL FAIR FOR INVENTORS.—Mr. George Wood, of Wood's Museum, New York, has tendered, for the purpose of an "Inventors' Perpetual Fair," one or more of the large halls in his museum, free to all inventors in the United States, for the exhibition of working models and, if necessary, working machinery. Offers of the latest improved engines and shafting, as well as of a number of other machines, have been already received, and the boilers have been set and are ready for connections. The plan is to have no admission fee to visitors, and no charge to exhibitors, other than their proportionate share of the expense for gas and attendance. So writes W. P. Newhall to the *American Artisan*.

SUBSTITUTE FOR LAMP-WICKS.—The *Scientific American* describes such a substitute in the form of a glass tube which has a bottom of wire gauze, and is filled with pulverized gypsum. The oil finds its way to the top by capillary attraction. It may be used without a chimney if desired. Any finely pulverized mineral may be used instead of gypsum.

Coal in China.

Professor A. S. Bickmore, who has visited some of the Chinese mines, read an interesting paper upon the subject before the American Association, from an abstract of which we quote briefly in reference to coal:

The Chinese do not mine for coal below the water line, having no proper pumping apparatus. The best coal in the kingdom remains yet undisturbed; but Professor Bickmore doubts if it will ever be found equal in quality to the coal of England or America. Coal was mined in the mountains west of Pekin six centuries ago, before its properties were known to European countries, and was found in common use in Pekin by Marco Polo, in the year 1290. There is an important mine at Mun-ti-kau, thirty-five miles southwest of the capital, which Professor Bickmore visited. The coal is carried in sacks of two bushels each to Pekin on camels and donkeys. An incline shaft has been sunk to a very great depth below the surface of the earth, following the drift of the coal, up which the coal is brought on sleds, by man-power, one Chinaman for each sled, the capacity of which is one bushel and a half. No machinery of any kind is in use. No artificial means of ventilation are employed. By reason of the fact that the Chinese do not go below the water line, fire-damp is almost unknown. In the north of China coal is ground to a dust and mixed with clay, that it may burn more slowly. The quantity of coal in China is immense. There are large mines in Manchuria, and in the mountains west of the Gulf of Lieutang, in the province of Shensi, and along the Yangts. South of the Meiling mountains the quality is inferior, but everywhere the supply is inexhaustible. Petroleum also was found 160 years ago in the province of Shensi. Du Halde, in his work on China, compiled from the diaries of Jesuit priests as long ago as 1725, says: "Its mountains distil a bituminous liquor, which they call 'oil of stone,' and use for lamps."

The Suez Canal.

We copy the following from the special correspondence of *The Engineer:*

"And now as regards the availability of the canal for long ships. On this head I can form only an unfavorable opinion. The fact that no fewer than six ships ran aground in a few hours is a bad omen. Now, it will be asked, how is it that ships drawing only 17 feet of water ran ashore in a canal 24 feet deep? The reply is simple. If the ships could be kept in the center of the canal there would be no grounding; but they cannot. At a moderate speed, say four miles an hour, it is absolutely impossible for the best steersman to keep the ship from falling off or yawing a little. Besides, the sides of a large steamer—to say nothing of her rigging—tower up above the banks for the greater part of the way, so that they can be seen miles off. With no very strong wind blowing across the canal it will be practically impossible to keep a ship from obeying its influence. She will have lee-way, and this lee-way will set her to one side or the other, in accordance with the direction of the wind. If the helm is used to counteract the influence of the wind the ship will advance, not with her keel parallel with, but diagonal to the canal. If the ship be short this will not much matter, but if she be long her bow will, under such conditions, be in dangerous proximity to the shallow water on one side, and her stern on the other. The slower the speed the greater will be her angle with the line of the canal; and it appears that slow speed must be the rule, for at a velocity of four miles an hour the wash is small as compared with that at greater speeds. I see no remedy for this evil but in the use of guy lines from the bank, which is out of the question, or the employment of a small tug, drawing a very few, three or four feet, of water, to accompany each ship and keep her stern up to the wind. Tug and rudder together would keep the ship in the line of the canal. Without the aid of tugs I feel convinced that a moderate wind would render the canal impassable by such as the P. and O. boats."

* * *

POISON IN THE NURSING BOTTLE.—It is said that the white rubber used for nursing bottles and infant's toys is very poisonous, causing sore mouth, skin eruption, decayed teeth, spinal curvature and death. In Europe the sale of it is prohibited by law.

PITTSBURG STEEL STATISTICS.—The manufacturers of Pittsburg claim the credit of supplying 65 per cent. of all the steel turned out in the United States. The first essays at its production date forty years back, but according to the Pittsburg *Commercial*, it is within the last eight years that the most remarkable progress has been made, which has placed the steel produced there on an equality with the best imported. According to the census of 1860, the six establishments employed in this manufacture, which then existed in Pittsburg, represented capital amounting to $1,080,050, and their annual products were valued at $888,000, a sum less than the annual sales of a single establishment at the present time. These steel works are now eight in number, and represent an invested capital of $4,500,000, and their annual products amount to nearly as much. According to the Assessor's books, the sales for the past year have reached the value of $3,956,845, and these being effected during a period of depression, show the magnitude of the trade.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

PACIFIC
Rolling Mill Company,
SAN FRANCISCO, CAL.
Established for the Manufacture of
RAILROAD AND OTHER IRON
—AND—
Every Variety of Shafting,
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames
—ALSO—
HAMMERED IRON
Of every description and size.

☞ Orders addressed to PACIFIC ROLLING MILL COMPANY Post Office, San Francisco, Cal., will receive prompt attention.

☞ The highest price paid for Scrap Iron 9v143m9p

I. O. O. F.
THE NEW AGE,
A WEEKLY JOURNAL OF SIXTEEN PAGES.
The "Official Organ" of the I. O. O. F. on the Pacific Coast.

Is devoted to Odd Fellowship, the ARTS AND SCIENCES and GENERAL LITERATURE; and as a family paper is not surpassed by any journal in the United States. Subscription price per year by mail, $5. Delivered in the city, per month, 50 cents. Office, Odd Fellows' Hall, 327 Montgomery street, San Francisco. 19v10

Important to Assayers.
Crucibles.
The Patent Plumbago Crucible Co.
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT, Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass. GALLAGHER, WEED & CO., California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S. Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
18v18-9p 519 Front street, San Francisco

$1. Postage Paid. $1.

A CHEAP AND HANDY BOOK
—FOR—
Mechanics, Inventors and Students.
SCIENTIFIC PRESS
NEW EDITION
—OF—
507 MECHANICAL MOVEMENTS.
PUBLISHED BY
DEWEY & CO.

LIST OF CONTENTS.

Æolipile.
Balance, Compensation: Barometer; Blower, Fan; Brake, Friction.
Cams; Capstans; Centrolinead; Clutches; Chasers; Clamps, bench and screw; Cock, four-way; Column, oscillating; Compasses, proportion; Counters of revolutions; Coupling, union; Crank—substitute for the, variable; Cranks, bell and compound; Cyclograph.
Differential Movements; Drag-link; Drill—Fiddle and Persian; Drills, Cramp; Drop; Drum and Rope; Driver, Pile; Dynamometers.
Eccentrics; Ejectors, Bilge; Ellipsograph. Engine, Disk; Engines—Retary, Steam, Valve Gear for; Epicyclic Trains; Escapements.
Fountain, Hiero's: Fusees.
Gasometers; Gauge, Bisecting; Gauges, Pressure; Gear, Steering; Gearing—Bevel, Brush, Capstan, Conical, Crown, Eccentric, Elliptical, Face, Friction, Internal, Irregular, Multiple, Mutilated, Scroll, Sector, Spur, Step, Stud, Sun and Planet; Gearing—Variable, Worm; Governors; Guides; Gyroscope.
Hammers—Atmospheric, Bell, Compressed Air, Trip, Steam; Helicograph; Hook—Boat-detaching, Releasing; Hooks, Centrifugal Check; Hyperbolas, Instrument for Drawing.
Intermittent Movements.
Jack—Hydrostatic, Lifting; Joint—Ball and Socket, Bayonet, Universal.
Ladder—Folding, Self-Adjusting; Lazy-tongs; Level, Self-recording; Lever—Bell-crank or Elbow, Knee; Lewis; Link. Detachable Chain.
Machine—Bohnenberger's, Drilling, Polishing, Punching, Warp-dressing; Main, Flexible Water; Maintaining Power; Meter—Gas (wet and dry), Water: Mill—Barker's, Crushing, Tread, Wind; Miscellaneous Movements; Motion—Alternating Traverse, Rocking, Self-reversing, Shuttle; Motions—Feed, Link, Parallel, Pump, Traverse, Variable Traverse.
Pantograph; Parabolas, Instrument for Drawing; Paradox, Mechanical; Pendulum, Conical; Pendulums, Compensation; Pinion—Lantern, Mutilated, Slotted, Two-toothed; Power, Horse; Presses, Hydrostatic; Propeller, Screw; Pulley—Expanding, Friction: Pulleys—Anti-friction Bearing for, Chain; Pump—Air, Balance, Bellows, Chain, Diaphragm, Steam-siphon; Pumps—Double-acting, Force, Lift, Rotary; Punching Machine.
Rack—Mangle, Mutilated; Racks and Pinions; Ram, Montgolfier's Water; Ratchets and Pawls: Regulator—Gas, Watch, Reversing Motion, Self; Revolver; Rollers, Oblique; Rolls—Anti-friction, Drawing, Feed; Rulers, Parallel.
Saw—Endless Band, Gig, Pendulum; Screw, Archimedes, Differential, Double Reversed, Micrometer; Screws—Endless, Right-and-left Hand; Sectors; See-saw; Shears; Stamps; Stand, Mirror; Stop—for Hoisting Apparatus, for Lantern Wheels, for Ratchet Wheels, for Spur Gear; Stops for Winding Watches.
Test, Friction; Throttle, Spinning; Toggle-joint; Tongs, Lifting; Trap, Steam: Treadles.
Water, Machines for Raising: Weir, Self-acting; Wheel Cam, Lantern, Persian, Pin, Rag, Sprocket, Steering, Waved; Wheels—Crown, Mangle, Paddle, Water; Windlass—Chinese, Friction; Windmills; Wipers.

This book is bound in cloth, and embraces 122 pages. The illustrations are plain, and each figure is clearly described on the page opposite to it. It is a low-priced book for its kind, and there are few persons who have to do with machinery, or are interested in understanding the science and principles of motion, who will not be benefitted and satisfied by its purchase.

A liberal discount made to the trade. Single copies, $1—sent postage free. Address orders,

WONDERFUL
Scientific Discovery.
THE GREATEST EVER MADE,
Having Baffled the Ingenuity of Chemists and Physiologists for Ages Past.

DR. CROWLY'S EMERALD HAIR BALM.

No EXAGGERATION, but a stern reality, verified by the undersigned:

Dear Doctor:—I feel much pleasure to inform you that your "Emerald Hair Balm" has caused the growth of hair on my head—having only used one of your bottles, although I had been bald for twenty-five years You are quite at liberty to use this intimation as you please. Yours truly, JOHN STAPLETON,
California street, San Francisco.

To W. J. Crowly, M. D., No. 20 Montgomery street, San Francisco. 23v19-3m

Important to Californians.

The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods CHEAPLY, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

The plant has no enemies; mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $25 per hundred; 20 per cent. off to the trade. Address,
HENRY HUGHES & J. S. SILVER,
1v20-1m 302 Battery street, San Francisco.

HIBBERD. SANBORN & CO.,
STAIR BUILDERS.

South Point Mills, Berry Street,
Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins. Fancy Newels and Balusters.

Metallurgy.

Metallurgical.

The undersigned respectfully announce to the public (especially to parties interested in mining) that they have opened an office at

No. 36 FREMONT STREET,

And WORKS at H. J. BOOTH & CO'S FOUNDRY, northeast corner First and Mission streets, San Francisco, where Ores in small or large quantities of all kinds can be worked by Pan Amalgamation, Chlorination or Smelting, and all kinds of Assays and Analyses made. We will also sample any Ores entrusted to our care; and in all cases returns made in the shortest time possible. We will give consultations on the best methods of successfully working Sulphurets or Refractory Ore.

Drawings Furnished for Quartz Mills, Smelting and Chlorination Furnaces.

By having had long practical experience in working Gold, Silver, Copper and Lead Ores, we hope thereby to get a share of the patronage of the mining public. ☞ Mines Examined and Reports made.

IN THE PROBATE COURT OF THE CITY AND County of San Francisco, State of California.

In the matter of the Estate of ABRAHAM CREEMER MESSERVE, deceased.

On reading and filing the petition of Benjamin Shellard, Administrator of the estate of Abraham Creemer Messerve, deceased, setting forth that he has filed an account of his administration upon said Estate in this Court, and that the same has been duly heard, allowed, and confirmed; that more than ten months have elapsed since the publication of notice to creditors, and that no claims against the said deceased have been presented to said Administrator, and the Estate is in a condition to be closed, and that the real property remains to be distributed among the heirs of said deceased; and praying, among other things, for an order of distribution of said real property among the persons entitled,

It is ordered, That all persons interested in the Estate of Abraham Creemor Messervo, deceased, be and appear before the Probate Court of the City and County of San Francisco, at the Court Room of said Court, in the City Hall, in said City and County of San Francisco, on the seventh day of February, A. D. 1870, at eleven o'clock in the forenoon of that day, then and there to show cause why an order of distribution should not be made of the real property of said Estate among the heirs of said deceased according to law.

It is further ordered, That a copy of this order be published at least for four successive weeks before the said seventh day of February, A. D. 1870, in the SCIENTIFIC PRESS, a newspaper printed and published in said City and County of San Francisco.

SELDEN S. WRIGHT, Probate Judge.
San Francisco January 5th, A. D. 1870. jan8-4w

Reading for the Hour.

Barnum the Giant Killer.

An occasional contributor, who is now in New York, writes us thus: * * The Cardiff Giant is played out. This is what did it: Barnum, who early in the game perceived "a mice," and who saw that something might be made of the thing if properly handled, offered the proprietors a large sum for an interest. But it was no go. It would not look well to have Barnum in it. He had too much the name of being connected with humbugs. So his offer was indignantly refused. To revenge himself, he hunted up a plaster-cast maker in Syracuse, and ordered six *fac-similes* of the giant; one apiece for New York, Philadelphia, Chicago, St. Louis, Cincinnati and Louisville. The one first completed was taken at once to New York, and placed in Wood's Museum. Then there was a commotion. The proprietors of the genuine giant rushed in hot haste to New York, and demanded an injunction against the exhibition of the bogus one. The Judge laughed at them. No comfort *there*. They were disconsolate. There was nothing to be done but to bring their treasure to the city, and rely upon its superior attractions to draw the crowd away from the "base imitation" to itself. It came; was seen; but didn't conquer. Not much. The first day it was exhibited to a considerable crowd; the second, to a mighty small one; the third, to a beggarly array of empty boxes. The game was up. That finished the "proprietors." The *fac-simile* made a *sick family* of them. Don't, by the way, charge that joke to *me*;—it is an old one. But it fits well here; for a sorrier-looking set you never saw, than these same proprietors. If they had only let in Barnum at the start! But they bearded the Great Mogul of Humbug upon his own ground, and so came to grief. Served 'em right.

The Power of the Flag.—During the war now raging in Cuba, a man was captured under suspicious circumstances by the Spaniards, tried, and condemned to be shot. He being, however, an Englishman by birth, and an American citizen by naturalization, the English and American consuls interposed, and declared that the authorities had no right to execute him. The remonstrances were not heeded, and the man was led out to die. As the muskets were already leveled, the two consuls gallantly sprang one to each side of the condemned man, and suddenly threw over him the Stars and Stripes and the Union Jack, daring the Spaniards to fire on the neutral flags. There was hesitation and consultation on the part of the authorities; but the consuls remaining firm, the prisoner's life was spared.

Map of the Hub.—The *Proof-Sheet*, a type founders' trade periodical, published in Philadelphia, contains a laughable "Map of Boston and the adjacent Country." It represents the hemisphere viewed from such a point in space that Boston appears as the geographical center of the globe. The Hub is represented to be about the size of Lake Ontario, and New York is too small to figure at all. The great lakes are the Boston water works; Mexico, Iceland and South America contain the gas works; the South Pacific is dotted with Boston bath houses; Madeira is the Yankee vinegar factory; and in the center of Africa is the Timbuctoo office of the *Atlantic Monthly*.

California Manganese in Liverpool. Lewis & Son's Liverpool Metal Circular, of November 16th, quotes manganese very dull at $52.20 per ton for 70 per cent. of fine quality, and adds: "Californian, of which there is a large stock, is almost unsaleable, owing to its inferior quality."

The Tchuktchi.

Who They Are.

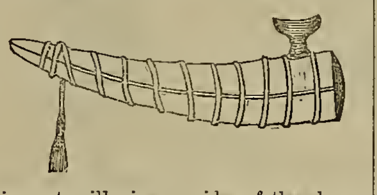
At the extreme northeastern point of Asia, bounded by the Polar Ocean on one side, and the sea of Behring on the other, lies the land of the Tchuktchi. The few travelers who have ever visited that bleak promontory, describe it as one of the dreariest regions of the earth. The climate is dreadfully cold, as may be expected in a country confined between icy seas. Before July 20th, there is no appearance of summer, and winter already sets in about August 20th. In this desolate nook of the old world, lives the only aboriginal people of North Asia which has known how to maintain its liberty to the present day.

Their Habits.

They live in low tents and in rather a natural way. Polygamy is general, and the men change their wives as often as they please. Still, though the women are certainly slaves, they are allowed more influence and are subjected to less labor than among many savages. The custom prevails (among others) of killing all deformed children, and all old people, as soon as they become too infirm to undergo the fatigues of a wandering life, for the people are continually changing their abodes.

Trade.

The Tchuktchi are continually carrying on an active trade with their neighbors, the Russians. They bring to Ostrownoje, a frontier town, large amounts of skins and furs, which they exchange for tobacco and ironware. Tobacco is the article of prime importance. Their pipes are larger at the stem than at the bowl, which holds but a small quantity of tobacco. The accompanying cut will give an idea of the shape. In smoking they swallow the fumes of the tobacco, and often, after puffing away for awhile, become completely intoxicated for the time.



A great number of other tribes of Siberia collect at their fairs, for the purpose of bartering their commodities against the goods of the Tchuktchi.

A Fair at Ostrownoje.

A government commissionary, assisted by some Cossacks, superintends the fair. All preliminaries having been arranged, the orthodox Russians repair to the chapel for the purpose of hearing a solemn mass, after which, the hoisting of a flag in the tower announces the opening of the market. At this welcome sign, the Tchuktchi, completely armed with spears, bows and arrows, advance with their sledges, and form a wide semi-circle around the fort, while the Russians and others ranged opposite, await the tolling of the bell, which begins the active business of the day.

The Russian Trader.

At the very first sound, the trader, grotesquely laden with packages of tobacco, kettles, knives, or whatever else he supposes best able to strike the fancy of the Tchuktchi, rushes as fast as he can towards the sledges, and in the jumble not seldom knocks down a competitor, or, is himself stretched at full length on the snow. But, unmindful of the loss of cap or gloves, which he does not give himself time enough to pick up, he starts afresh, to make up for the delay by redoubled activity. Before he reaches the first Tschuktch, his eloquence breaks forth in an interminable flow, and in a strange jargon of Russian, Tchuktch and Jakute, he praises the excellence of his tobacco, or the solidity of his kettles.

The Tchuktch Trader.

The imperturbable gravity of the Tchuktch forms a remarkable contrast to the greedy eagerness of the Russian. Without replying to his harangue, he merely shakes his head if the other offers him too little for his goods, and never for an instant loses his self-possession; while the Russian, in his hurry, not seldom hands over two "pouds" of tobacco for one, or pockets a red fox instead of a black one. Although the Tchuktch have no scales with them, it is not easy to deceive them in the weight; for they know exactly, by the feeling of the hand, whether a quarter of a pound is wanting to the poud (about thirty-six pounds).

The fair seldom lasts longer than three days and Ostrownoje, which must have but few stationary inhabitants indeed (as it is not even mentioned in statistical accounts, which cite towns of seventeen souls), is soon after abandoned to its ultra-Siberian solitude.—*The Polar World.*

Fire.

The nature of fire has caused much trouble to philosophers in former days. It was a long time considered that fire was an elementary form of matter, and that burning was the escape of this principle, which had previously been pent up in the combustible substance, visibly manifested by the flame.

It was only in 1783 that the true theory of combustion was discovered by a French chemist named Lavoisier, who hit upon the idea of weighing the products. His theory is now everywhere accepted.

Burning is merely a chemical change—a chemical combination of the burning substance with oxygen, and the light and heat evolved are only such phenomena as are produced in a more or less marked degree during every chemical change. The products of ordinary combustion are only two, carbonic acid gas and water or watery vapor. These being colorless, transparent, and entirely devoid of taste, escape unnoticed in common life. If, however, as can be done by chemical means with ease, we collect the smoke and weigh it, we shall find that it weighs more than the original fuel, and this extra weight is exactly equal to that of the oxygen of the air consumed in the process.

The products of combustion, the carbonic acid and the aqueous vapor, are not lost, but, after spreading through the atmosphere, are absorbed by the leaves of some tree, and here, in nature's laboratories, are reformed into fresh wood, and the wood which we have once burned may be used again by future generations.

A criminal, as well as fool, was that man Clark, of Covington, Kentucky, who gratuitously supposed that a gun was unloaded, pointed it at his child, pulled the trigger, and drove a charge of shot through the boy's head. That a grown man should commit such an act is absolutely criminal, and deserves the severest punishment. Such cases are getting too common, and the transgressor should be made such an example of, that fear of punishment may supply the want of brains for people in the future.

John, as a Shootist, is to be highly commended, if he only continues to do as well as he lately did in Virginia City, when, according to a telegram, "one Chinaman shot another in the stomach, bruising the skin considerably." If the wounded man had had the sense to hold his stomach out at arm's length, he might have, perhaps, escaped without injury to his delicate cuticle.

Hints and Recipes.

To Harden Plaster of Paris Casts.—It is said that the addition of a small quantity of finely pulverized marsh-mallow roots to calcined plaster of Paris will prevent the mass, when mixed with water, from hardening so rapidly as it commonly does, so as to prevent its applicability to many purposes. It will require nearly an hour to become thoroughly set; and then it will be found to have acquired such an extreme toughness and tenacity as to permit it to be filed, turned and bored, and otherwise manipulated, almost as satisfactorily as ivory, bone or meerschaum. Mixed with different coloring matters, an excellent imitation of marble can be produced.

Orange Marmalade.—Cut the oranges in half, then take out the pulp and juice, separating all the skins and pips. Put the rinds into salt and water for a night; the next morning put them into a stewpan with fresh water. Let them stew until soft, so that a straw can be run through them easily; cut the peels into thin slips. To every pound of fruit add one pound and a half of coarse white sugar. Put the juice, pulp, and peel, with the sugar, into the stewpan, and let it boil twenty minutes. Seville oranges must be used, and the marmalade is better if kept six months. The juice and grated rind of two lemons to every dozen oranges is a great improvement.—*Jessie Piesse.*

Oil for Burns.—A remarkable case of the utility of oil in case of burns is given in a German paper: A ballet girl whose dress took fire at Leipsic, and burned her to such an extent as to produce most horrible agony, was placed in oil, when her sufferings instantly ceased. She remained in the bath nine days and nights, during which time the oil was renewed five times. When taken out, she suffered no pain, and was entirely freed from the effects of the fire in three weeks.

Red Dye for Wool.—A good, bright, red color may be obtained in the following way: Stiff paste is made of lac dye and sulphuric acid, and allowed to stand for a day. For dyeing ten pounds of wool, one pound of tartar, two-thirds of a pound of salts of tin, and three-quarters of a pound of the paste are required. The wool must be boiled in the bath for three-quarters of an hour, after which it must be rinsed and dried.

Paste Blacking.—3 gills vinegar, 4 oz. ivory black, 1 oz. oil of vitriol, 1 oz. sperm oil, 2 tablespoonfuls of brown sugar. Put the oil, ivory black, molasses and sugar into a bowl together, stir them up well, then add the vinegar. Let it remain two or three days before adding the vitriol; then bottle it, taking care to have the corks well resined. It is best to keep it six months, but may be used directly.

A Silent Coal Scuttle.—Great annoyance is often caused to invalids by the ordinary method of putting coals in the grate by means of a coal scuttle. A very simple remedy, and one which should be introduced into every sick room, consists in placing the coals in paper bags, holding about four pounds each, and laying them quietly on the fire with the hands, when the bags quietly ignite, and leave the coals to be distributed noiselessly over the fire.

To Prevent Feathers Working Through Ticks.—Empty the feathers from your tick, turn it wrong side out, and lay it on a table. Then, with a piece of beeswax, slightly warmed, rub the tick thoroughly, giving the entire surface a light coat of the wax. No more feathers will ever work through that tick until the stuff is worn through.

To Take Stains out of Silver or Silver Plate.—Steep the plate in soap lye for four hours; then cover it over with whiting wet with vinegar, so that it may stick thick upon it, and dry bran, and the stains will not only disappear, but the plate will look exceedingly bright.

Rats may be prevented from gnawing a harness or other material, which absorbs grease by mixing with the oil applied a little cayenne pepper, say a teaspoonful to the quart. The rats get bite for bite, and clear out before doing any damage, feeling uncommon *smart.*

Cement that will Resist Red Heat and Boiling Water may be made as follows: Dried clay in powder, 6 ℔s; iron filings, 1 ℔; make into paste with boiled linseed oil.

Price Reduced, Jan. 1st, 1870.

The SCIENTIFIC PRESS, a first-class finely-printed and illustrated paper, is now furnished at $4 a year, which is exceedingly low-priced for a journal of its class and reputation on this coast.

During the past year the publishers of this journal have largely increased the reading space in the paper, introduced a leading department relating to farming and gardening, and published more articles relating to mechanic arts and miscellaneous subjects, both instructive and interesting for the hour. We find this course is well approved by our intelligent patrons everywhere. Located in the mines, cities or agricultural districts, many prefer a journal which brings them information of the more important discoveries in sciences, of inventions and developments in the progress of the leading arts and industries on this coast, to a periodical technically and more specially devoted to either science, mining, or farming alone—whether issued at home or abroad.

With this number we adopt an abbreviated and more convenient title for our paper, but wish it distinctly understood that we shall not abate our mining advocacy—or change other leading departments embraced in our past volumes, except to increase and improve them. The three leading interests represented in the SCIENTIFIC PRESS,—Mining, Farming and Mechanic Arts,—closely allied and associated on this coast, "form the base and groundwork of prosperity" of the community in the field it occupies.

Our present patrons can assist by advertising its worth and its price to others, and enable us to continue to increase and improve its reading columns.

Respectfully,

DEWEY & CO.,

Publishers and Patent Agents.

CURE FOR COUGH OR COLD.—As soon as there is the slightest uneasiness of the chest, with difficulty of breathing, or indications of cough, take during the day a few of "*Brown's Bronchial Troches.*" Containing demulcent ingredients, they allay pulmonary irritation. Have them in readiness upon the first appearance of a cough or cold.

PATENTS ON THE PACIFIC COAST.—To those of our friends who desire to keep posted upon inventions upon the Pacific coast we say, subscribe for the SCIENTIFIC PRESS, published by Dewey & Co., San Francisco, Cal., at $4 per year. The opening of the railway across the continent has given to all patents a much higher value in that portion of our country known as the Pacific slope, and all interested will find the paper above alluded to a valuable reference.—*Mechanic and Inventor, Detroit, Michigan.*

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24v18-4w

TREATMENT OF REBELLIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. HOWLAND.

SPECTACLES, Opera Glasses, Telescopes, Marine Glasses, Magnifying Glasses, etc., are to be found at C. Muller's, 205 Montgomery street. *

BLOCK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 24v19-3m

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

RETURNED.—Dr. J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

SEND FORMER ADDRESS when you wish your paper directed to a new place.

New Mining Notices.

Glenwood Mill and Mining Company.—

Location of Works: Greenwood, El Dorado County, California.

NOTICE.—There are delinquent on the following described stock, on account of assessment levied on the seventh day of December, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Lucy Janeson	24	70	$14 00
Michael McCarthy	15	70	14 00
J H Sayre	36	140	28 00
J H Wood	31	67	13 40
J H Wood	not issued	105	21 00
J J Miller....balance due	34	220	30 75

And in accordance with law and an order of the Board of Trustees, made on the seventh day of December, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, No. 318 California street, San Francisco, Cal., on Tuesday, the first day of February, 1870 at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

O. D. SQUIRE, Secretary.

Office, 418 California street, San Francisco. jan15

Imperial Mining Company.—Location of

Works: White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of January, 1870, an assessment of twenty-five (25) cents per share was levied upon the capital stock of said Company, payable within thirty days, in United States gold and silver coin, to the Secretary, No. 319 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the tenth day of February, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eight day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. E. MOODY, Secretary.

Office, 319 California street, San Francisco. jan15

Mining Notices--Continued.

Alleghany Consolidated Gold Mining Company, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of December, 1869, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the seventh day of February, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street, San Francisco. jan8

Wenban, at Cortez.

Any stock upon which said assessment shall remain unpaid on the twentieth day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the eighth day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.

Office, 426 Montgomery street, San Francisco. dec18

Cassell Silver Mining Company.—Location

of Works: Cortez, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of December, 1869, an assessment of three dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, or to S. Wenban, at Cortez.

Any stock upon which said assessment shall remain unpaid on the twentieth day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the eighth day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.

Office, 426 Montgomery street, San Francisco. dec18

Latawana Mining Company.---Location:

Hamilton City, White Pine, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the twenty-second day of December, 1869, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at 614 Merchant street, Room 26, or at 526 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the nineteenth day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. MARTINON, Secretary.

Office, 614 Merchant street, Room 26, or 526 California street, San Francisco. dec18

Pinto Mining Company.—Location of

Works: Silverado, Pinto District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of January, 1870, an assessment of fifteen (15) cents per share was levied upon the capital stock of said Company, payable on the fifth day of January, 1870, in United States gold coin, to the Secretary, No. 426 Montgomery street, San Francisco, Cal., or to HOMER S. KING, ESQ., Agent of Wells, Fargo & Co., Hamilton, Nevada.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of February, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventh day of March, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Advertising and Subscription

Rates for the Scientific Press.

SUBSCRIPTIONS IN ADVANCE:—One year, $4; six months, $2.50; single copies, 10 cents; Monthly Series, $4.50 per annum; Quarterly Series (stiff paper binding) $5.

Lowest Rates for Advertising:

We shall adhere to the following rates (payable in gold coin) for advertising in the SCIENTIFIC PRESS from this date:

	1 week.	*1 month.*	*3 months.*	*1 year.*
One sq. (10 lines agate)	$1 50	$ 3 00	$ 8 00	$ 32 00
Two squares	3 00	6 00	15 00	60 00
Three squares	4 50	9 00	20 00	76 00
One-fourth column	6 00	12 00	28 00	100 00
Half column	12 00	20 00	54 00	200 00
One column	20 00	40 00	100 00	400 00

RATES BY THE LINE.

Per line.—One week, 25 cents; one month, 80 cents; three months, $2; one year, $5.

Per line, ten lines or more.—One week, 20 cents; one month, 30 cents; three months, 80 cents; one year, $3.20,

MINING AND LEGAL ADVERTISEMENTS will be inserted at special rates—less than one-half the cost of daily publication.

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form. We will otherwise assist advertisers in getting up their notices, when desired.

☞ All advertisements in the PRESS appear in both the ☞ the MONTHLY AND QUARTERLY SERIES of the SCIEN- ☞ TIFIC PRESS, which (by special arrangement) are ☞ placed for FREE READING in the principal hotels, ☞ steamboat and steamship saloons, depots, and pub- ☞ lic reading rooms and libraries in San Francisco and ☞ Pacific States. Many volumes are also bound, thus ☞ affording permanent advertising.

The PRESS now receives the largest and best advertising patronage of ANY WEEKLY PAPER west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—*our advertisers.* Better referees, or more reliable names, cannot be found in the advertising columns of any newspaper in the world.

SUTRO TUNNEL COMPANY.

CAPITAL STOCK, - - - $12,000,000.

DIVIDED INTO 1,200,000 SHARES OF

TEN DOLLARS EACH,

FULL PAID STOCK.

OFFICERS OF THE COMPANY.

President	SAMUEL MERRITT.
Vice-President	MICHAEL REESE.
Treasurer	J. SELIGMAN & CO.
Secretary and General Agent	W. K. VAN ALEN.

BOARD OF TRUSTEES—Samuel Merritt, Michael Reese, Abraham Seligman, John B. Felton, Joseph Aron, Wm. H. Sharp, Henry Barroilhet.

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, SEVEN MILES IN LENGTH BY FOUR THOUSAND FEET IN WIDTH, EMBRACING FIVE THOUSAND AND TWENTY ACRES.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of ALL mines discovered by the Tunnel.

4th—A royalty forever of TWO DOLLARS on each and every ton of ore extracted from any part of the Comstock Lode, and

5th—The right of appropriation of all the water carried off through the Tunnel.

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, and be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to all parts of the mines, and through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make available many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt as to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, as has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwall, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata and Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots and mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very important revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Company two dollars per ton, forever, on every ton of ore extracted from any portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of this great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, and confidence in, all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coast,

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

Steam Engines and Boilers constantly on hand and for sale.

We would call particular attention to our

SCOTT & ECKART CUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Off at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 50 or 60 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Mont'y Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Plainers, Shapers, Drills, Etc.

On hand and for sale, Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

☞ We are prepared to furnish all kinds of Machinery at short notice, as our facilities are unequalled on the Pacific Coast.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalied Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

Ayer's
Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

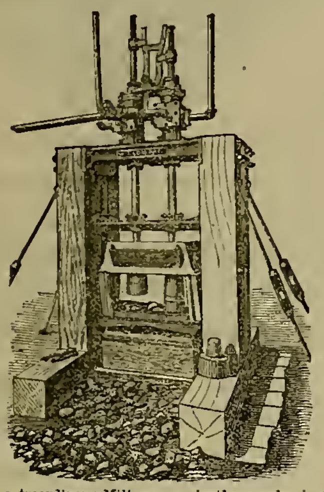
Machinery.

THE WILSON

Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

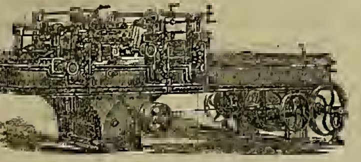
A. BICKNELL, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

Woodworth Planers,



PLANERS AND MATCHERS,

With patent expansion, feed gear and other improvements made at Worcester, Mass., in the most finished and substantial manner; also every description of Richardson Meriam & Co's, Smith's and Wood's celebrated

Wood Working Machinery.

Embracing Mortising, Sash and Moulding, Smith's Stickers, Slat and Door Tenoning, Boring, Shaping, Scroll Sawing, Planing, Rod and Dowell making and Re-sawing Machines, Wood and Engine Lathes, etc., for sale at Eastern prices, at the Machinery Depot of

BERRY & PLACE.
112 and 114 California st., San Francisco.

☞ Agents for Blake's Patent Steam Pump, (warranted the best in the market); Davis & Furber's Woolen Machinery, etc. Being the selling agents for most first class Eastern builders, millmen and others in want of Machinery can save money by giving us a call. Illustrated Catalogues sent free.

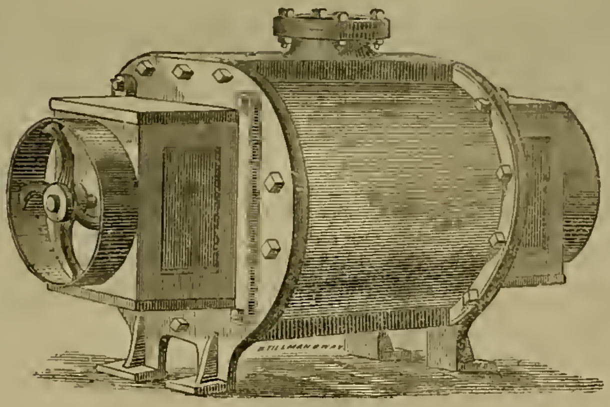
To all who may wish to obtain a thorough knowledge of the industrial resources of the Pacific Coast, the Press will be found a valuable paper.—*Oakland Transcript.*

ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

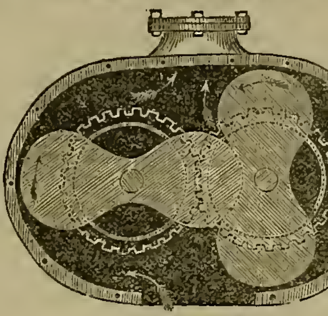
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 21, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

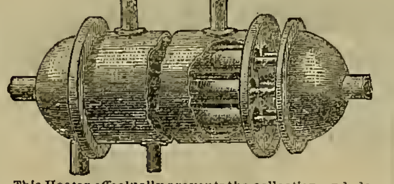
Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,
4v16-3m **Globe Iron Works, Stockton, Cal.**

CROSS' COMBINED Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,
16v18-3m Patentee, Sacramento, Cal.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont street,
1v1 San Francisco.

International Hotel,

JACKSON STREET,

BETWEEN MONTGOMERY AND KEARNY STS.,

SAN FRANCISCO, CAL.

THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stop at. The Beds are new and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.

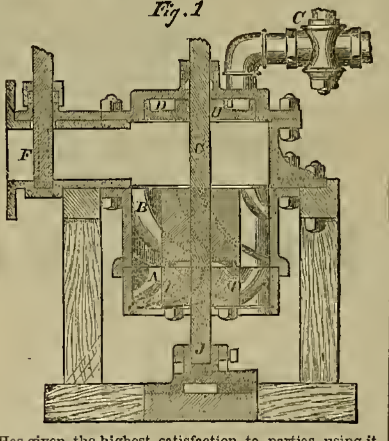
Prices varying from $1 50 to $2 per day for Board and Room.

FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.

☞ Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House free of charge, and to any part of the city for 50 cents
21v12 F. E. WEYGANT, Proprietor.

Lind's Improved Water Wheel

Fig. 1



Has given the highest satisfaction to parties using it. We are now prepared to sell it at reduced prices. Will also contract for all kinds of Machinery—Flour, Saw and Quartz Mill. All our work guaranteed. We will send competent men to put up our Wheels and Machinery. We contract for or do it ourselves. Our extensive acquaintance with millwrights on this coast enables us to furnish millmen with the best of workmen at short notice. Drawings for contracts furnished gratis. Send for circular.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

CAUTION AGAINST FRAUD.

Declared by Connoisseurs to be the only good Sauce. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for Lea & Perrins' Sauce, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-1yeow

Volunteer Compliments.

From an endless series of appreciative testimonials and frank acknowledgements, we give the following:

Suisun City, Cal., June 26, 1869.

Messrs. Dewey & Co:—This is the third time you have presented me with Letters Patent within twelve months. Gentlemen, you have dons all I have asked of you—you have heen houest; you aro men that su inventor can rely upon for doing business for him, snd h need not fear of being swindled or wronged in suy way. I would give you business to do in your various departments in preferenco to any one else. Many thanks to you for your success. You have obtained valuable patents for me, and I appreciate your kindness, your honesty, ability and success. Yours, Richarn Knott.

"Tidal Wave" Office, Silver City,
Idaho Territory, July 27th, 1869.

Messrs. Dewey & Co.—Gentlemen:—Allow me to express my high appreciation of the ability and business management of the Mining aud Scientific Press Patent Agency, and to say thst our husiness relations have been marked with the utmost promptitude upon your psrt and with entire sstisfaction upon mine.
Yours, etc., Jno. S. Butlen.

San Francisco, May 5, 1869.—Messrs. Dewey & Co. Gentlemen:—Allow ms to express to you many thanks for services rendered me in procuring my pstent, which has just come to hand. I would also say that your work has been faithfully done, and your advice and representations hsve in sll cases been honest and truthful.
Respectfully, Geo. Inwood,

Portland, Oregon, May 2, 1869.

Messrs. Dewey & Co—*Gentlemen:*—Receive my kindest thsnks for your attention in the matter of bringing my application for a Patent to a successful issue.
Thomas Mann

Grass Valley, Dec. 2, 1868—*Messrs. Dewey & Co:*—Having received the patent for Symons & Co's Tossing and Refining Concentrator, through your Agency, we return our sincere thanks to you for your unrivalled success. Yours, respectfully, Symons & Harry.

Lexington, April 3, 1869.

Dear Sirs:—Tho Letters Pstent have just come to hand. For the prompt and business-liko manner with which you have put the matter through, plesse accept my thanks. Geo. W. Teasdale.

To Dewey & Co., Publishers M. & S. Press.

Stockton, April 8th, 1869.

Messrs. Dewey & Co.:—Your favor of the 6th inst., accompanying patent for improvement in horse shoes, is received. I heg you will accept the earnest assurance of my grstitude for your kind assistance and valuable services. Very truly yours, W. R. Watson.

Somersville, Cal., August 25th, 1869.

Messrs. Dewey & Co.—Dear Sirs: Allow me to return you my thanks for tho very able manner in which you have conducted the business entrusted to your care. You will plesse forward the document (British Patent) by Bamher's Express to this plsce. Yours, respectfully,
Geo. Hawxhurst.

Jamestown, Cal., July 6th, 1869.

Messrs. Dewey & Co.—Gentlemen:—The Patent for our Ore Washer and Concentrator wss duly received by express. We return you our thsnks for the promptness and successful msnner which have attended your efforts in our hehalf. Yours, Wm. G. Heslep.

Santa Cruz, December 30, 1869.

Messrs. Dewey & Co —*Gentlemen:*—Yours of the 24th December, inclosing my pstent for construction of earthquake-proof wall, was duly received last night. I am highly pleased with the way in which the husiness has been done. The ability which carried it through, and the scrupulous care bestowed on its preparation, are above praise; and I will gladly intrust to your hands any further husiness I may have to do, which will soon take place on s very useful and important invention.
Very truly yours, A. McPherson.

We have hsd frequent occasion to have business relations with the psteut agency connected with this establishment, and have had nothing left to desire in regard o it. Fidelity, promptness and courtesy, soon srranged everything for us to our complete satisfaction. Having hsd frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

Nevada City, Nov. 3d, 1868.

Messrs. Dewey & Co.—Gentlemen:—Your favor of the 30th ult., is just received, informing me of the successfull prosecution of my application for a patent on my "Hair Cutting Shears." Pleaso sccept my sincere thanks for the speedy and successful manner in which you have conducted the case, and believe me, as ever,
Very truly yours, Lee D. Craig.

Mayfield, Csl., June 26, 1869.

Dewey & Co., *Patent Solicitors, San Francisco*—Gentlemen:—In scknowledging the receipt of my Letters Pateut, allow me to express my thanks for the skillful and trustworthy manner in which you have conducted my business before tho Depsrtmeut at Washingtou. I am perfectly sstisfied with the high degree of sbility and integrity displayed in the management of my case, and I know of no similar agency in which I could place corresponding trust. Yours truly, J. M. Johnson.

San Francisco, April 19, 1859.

Messrs. Dewey & Co., Patent Agents.—*Gentlemen:*—Allow me herewith to tender you my sincere thanks for tho efficient assistance you have rendered mo in securing my patent, and other papers, as well as the promptness and energy displayed by you in our husiness transactions. Very respectfully yours, C. E. Jaycox.

Yearly Subscription Reduced to $4.—Jan. 1, 1870.

The Scientific Press

An Illustrated Journal of Mining, Farming and Mechanic Arts.

The Scientific Press, devoted to Scientific and Mechanical Progress, Mining, Farming and Mechanic Arts, contains more Valuable Reading Matter thau any other weekly journal west of the Rocky Mouutains. It is the best printed and ouly finely-illustrated paper on the Coast. Its articles are able, timely, and reliable, and written in a more interesting and easily comprehensive style than scientific papers in general. Now iu its twentieth volume, it is printed on superior paper, coutaining sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe. All our better citizens have an active interest in the new discoveries and in the development and progress of the three great industrial pursuits named above, which are closely allied on this coast and jointly represented in the Press, rendering the paper a popular and influential journal with all industrial readers.

To Inventors on the Pacific Coast.

Our U. S. and Foreign PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of loug establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventious patented through our Agency will have the benefit of an illustration or description in the Scientific Press. We transact every hranch of patent business, and obtain patents in all civilized countries.

The large majority of United States and Foreign Patents granted to inventors on the Pacific Coast during the past few years have been obtained through our Agency. Established in 1860, we have an extensive patent lihrary, with full record of cases on this coast, with complete U. S. reports, and can give the best and most reliahle advice as to the patentability of new inventions. Advice and illustrated circulars free. Our prices are now as favorahle as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

The Illustration of Inventions

In the Scientific Press is a high recommendation for them, and is the hest and cheapest method of bringing them to the notice of the public in a proper manner, hesides being the most effectual method of selling valuable patent rights and patented articles.

Engraving on Wood

Of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also engraviug ou metals.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowod with tho National Land Grant in 1856, furnishes advanced instruction in the various branches of Mathematicsl, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," Nsw Haven, Conn. 13v6-1y16p

VOLUME XX.
Number 4.

A New Explosive—Dualine.

The attention of mining and military engineers in Europe is much engrossed at the present time in a new explosive, recently invented by Mr. Nobel, inventor of nitro-glycerine and dynamite. It will be recollected that dynamite was devised to meet the objections to the use of nitro-glycerine. We are told that "dualine" has now been introduced to meet the objections to dynamite.

This new explosive consists principally of nitrate of ammonia and very fine saw-dust, which has been acted upon by nitro-sulphuric acid. It is said that it will neither decompose (even by being accidentally brought into contact with acids), nor congeal, nor pack together, nor lose any of its properties, during cold or hot weather. Its explosion does not cause the development of any noxious gases. When fired by a flame or coal, it will burn in the open air without exploding. Twenty-five pounds of dualine, contained in a strongly-made keg, over which a large fire was built, commenced burning rather slowly only after the staves had been burned through. But, if confined in a strong inclosure, as in a well-tamped blast-hole, it can be exploded like powder by a fuse or spark. The stronger the inclosure is, the greater is the effect of the explosion. In open air, or with a tamping of loose sand, or under water, it is necessary to use a cap in order to cause explosion.

Dualine is said to be so little sensitive to concussion that it may, without danger of premature explosion, be used for the bursting charge of shells. It acts on rock and coal less violently than nitro-glycerine and dynamite do; its explosion produces in coal a larger quantity of lumps and round coal than even a corresponding charge of powder. A remarkable insensitiveness to concussion and friction, and its inexplosive nature, render it much less dangerous than common powder. It may be stored, transported, and applied with hardly any risk at all.

Absolutely cheaper than either nitro-glycerine or dynamite, it is also relatively cheaper than common blasting powder; for hardly one-fifth of the work and time required in using the latter is needed for successfully operating with dualine. So free is it from the development of noxious gases that miners may resume their work immediately after a blast has been fired. In the Dudweiler mine, for instance, not well ventilated, five blasts were made in quick succession; yet the miners were not in the least molested by the gases developed by the combustion of ten ounces of dualine used for the charges of these blasts.

From the above description it may be inferred that dualine is very similar, in composition, to gun-cotton, but more convenient for use. In regard to its efficacy as compared with dynamite, it is considered about equal; but slower in action—in this respect corresponding to gun-cotton. However, it is extremely difficult to get at comparative results in blasting experiments, as in most instances, the experimenter must be satisfied with the average results of a great number of trials undertaken under various conditions. But it is nevertheless easy, in one respect, to fix a difference between the two materials, which leaves no doubt as to the superiority of the dynamite for certain purposes.

If equal quantities of dynamite and dualine, provided with primers, are allowed to explode upon iron plates of equal strength, the effect indicates such an evident difference, that one must adjudge to the former a much more rapid and violent action. This will certainly be recognized in blasting rocks. With regard to the burning of dualine, in contact with flame, there appears to be some difference of opinion, notwithstanding the experiment reported above. Of the dynamite, however, it is sufficiently established that it will never explode on holding a flame near it, but simply burn, even if enclosed in strong wooden boxes.

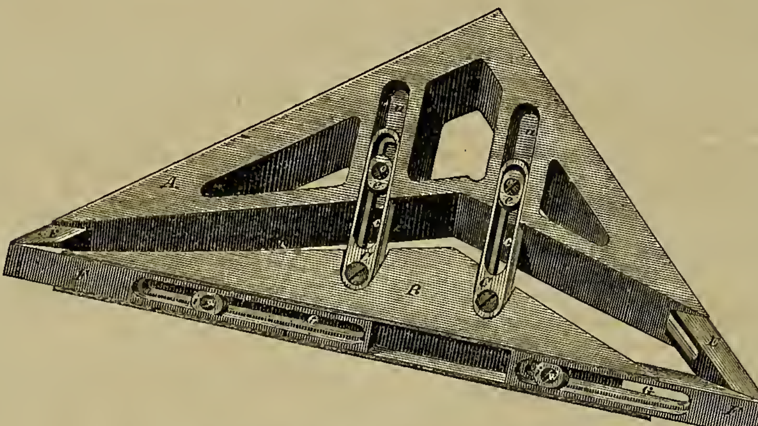
If the facts, as related of this new explosive are correct, it may be destined to occupy, ere long, in *mining* operations on this continent the same place which it appears to have obtained in Europe since last May, when the first trials were made with it. We presume that some of our enterprising manufacturers of explosives have already had their attention called to this new agent, and that in due time, if it really possesses the advantages above described, it will be introduced to practical use on the Pacific coast.

* * *

CALIFORNIA MEDICAL GAZETTE—FLORA OF SAN FRANCISCO.—Prof. H. N. Bolander, late State Botanist, is giving, in the *California Medical Gazette*, a catalogue of the plants growing within a space of one hundred miles north and south of San Francisco and as far east as Mount Diablo. He has been assisted in preparing it by Dr. A. Kellogg and G. H. Bloomer. The Latin and English names of each plant are given, and also its natural *habitat*. The January number of the *Gazette* devotes twelve pages to the catalogue, and it is "to be continued."

Extension Pitch-Board.

In building stairs, the carpenter needs some rule, by means of which he can measure and construct, of exactly the same size, for the same flight, the height and the tread of the steps. Hitherto, for this purpose, stair-builders have commonly used a triangular piece of board, which, however, is seldom available a second time; for, owing to the varying heights of the stories in different houses, and to the various angles at which the stairs are built, a new pitch-board must commonly be made for each flight. Hence, in visiting builders' shops, one often sees in some corner a pile of old triangular boards, which, having served their purpose once, are thrown aside—never, perhaps, to be of use again.



DREW'S PATENT EXTENSION PITCH-BOARD.

To obviate the waste of material thus incurred, and, moreover, to prevent the loss of time consequent on making ever new pitch-boards, an enterprising stair-builder of this city has invented a very ingenious apparatus, which is so constructed that it may be set to the desired size for any flight of stairs. The details of this "extension pitch-board" will be seen from the illustration.

The pitch-board is of triangular shape, with one side shorter than the other. It consists principally of two pieces, A and B, of wood or metal, which, when closed together or when extended to any size, and the sides produced, in the manner hereafter shown, form a right-angled triangle.

The two pieces, A and B, are joined together by the two slides, C, C. One end of these are fitted into a slot in the piece, B, and is there loosely secured by means of pivots, bolts or screws; the other end moves in a channel, *a*, which is made in the piece, A. The slides are provided with a longitudinal slot, *c*, which is countersunk around its upper edge. A small plate, *e*, rests in the sink, and a screw, *o*, passes through it and the slot and into the piece, A, below the slot; so that, by loosening the screw, the piece, B, can be drawn off from A any required distance, and then firmly held there by tightening up the screw. The channel in the piece, A, in which the slides move, may be made in the form of a dove-tail, narrow at the top, in order to keep these steady. The groove or slot in B is cut away on each side of the slide, so as to allow the piece B, to turn to any required angle.

The slides, E, are let into the edges of A, and the slides, F, into the edges of B, so that they are flush with them, and a fair edge is presented whether they are closed up or drawn out. In order to keep these sliding pieces firmly fixed at any desired point, a long slot, G, is made through them, and a plate, *i*, and screw, *n*, serve to secure them in the same way as *e*, and *o* secure the slides, C.

As the relation of the rise to the tread of the stairs varies according to the angle desired, the relative position of B must be made to vary correspondingly, and this is effected by drawing out one of the slides, C, farther then the other. To use this pitch-board, having determined the rise and tread of the stairs, we loosen the screws, *o*, and draw out B. We then produce the slides, E, E, the proper distance, so that the sides of A (thus extended) correspond to rise and tread, and fasten these slides by means of the proper screws. Then producing the slide, F, until it touches the end of a slide, E, and moving B and producing the other slide F until it touches the end of the corresponding slide, E, fasten the whole by the screws *n* and o.

This apparatus has been patented through the SCIENTIFIC PRESS Agency to John R. Drew, of the firm of Dillon & Drew, corner Natoma and Fifth streets San Francisco, to which address any applications for further information or the purchase of State rights, may be made.

* * *

A CALIFORNIA SHINGLE MACHINE.—According to the Humboldt *Times*, the new shingle machine invented by H. C. Babcock, of Eureka, Humboldt county, has been thoroughly tested, and has proved a complete success. It rives and shaves shingles on both sides. The first machine put up is now running on Salmon creek by horse power. Two horses rive and shave from twelve to fifteen thousand shingles per day, and the work is done more accurately than can be with the drawing knife. There is no clogging or trouble in adjusting the shingle bolts.

* * *

EMIGRATION TO COLORADO TERRITORY.—Gov. McCook, in his message to the Territorial Legislature of Colorado, says that he has received communications from three German colonies, one containing forty families, and the other two over 200 families in each, declaring their intention to emigrate to the Territory next spring. He adds that almost every day he receives letters asking for information. He, therefore, wishes preparations to be made for emigrants, and publications issued containing reliable statistics concerning the agricultural and other resources of the country.

Communications.

Mills and Mines of Colorado—No. III.

BY ALMARIN B. PAUL.

[Written for the Scientific Press.]

Lower Empire.

The mill of the Knickerbocker Company, of New York, is located at what may be termed Lower Empire, a place of some fifty houses, and no very large population; one of those mining towns which have seen better days. It is a beautiful location, being a small valley or flat surrounded by high and rugged mountains. It is very picturesque. I prophesy for it renewed prosperity.

The Knickerbocker Mill

Has twenty stamps of 500 pounds each, and bears more resemblance to our California wet-crushing mills than the ones previously spoken of. The superintendent is Dr. S. C. Monson, of New York. To all wet-crushing mills here are copper plates in abundance—what the copper plates don't take up is lost, and they have about the meanest ores for copper plates imaginable.

There is another feature quite prevalent here, and that is, they clean up the batteries every twenty-four hours. They say they make the rock pay better by doing so. This does not speak very well for the copper plates. There are nine Freiberg pans connected with the mill, which are used now and then for sulphurets.

Rae's Electric Process.

Latterly there has been introduced Rae's Electric Process. For this there are two wooden barrels, with iron heads, twenty-seven inches in diameter and six feet in length. These barrels are so arranged that they revolve around an iron shaft which passes through them. On this shaft are zinc arms, which dip into the material as it revolves. The inside of the barrel is lined with copper. (Zinc and copper thus arranged form the two poles of an electric battery.) The pulp as it flows from the stamps is worked in charges of 1,000 pounds each. In cleaning up, the adjustable heads are taken out and the gold scraped off of the coppers.

What the result has been by this mode of working I have not been able to learn. The process was first brought out by Dr. Rae, in Syracuse, New York, where very satisfactory tests were made.

Remarks on Electrical Processes.

It would seem that we must soon, if we have not already, hit upon the right manner of working our gold and silver ores by electricity. That they are to be so worked, I am fully convinced. There are too many now experimenting in this line not to produce some practical system, either singly or by combinations. One trouble to the advancement of this system is the cold shoulder which anything new gets. There are but few men who can stand the expense of doing all the testing at their own expense, and this when no one gets encouragement. Some depend on encouragement; without it they fail, while others do not ask it. Encouragement is cheap; so let all lend an ear, cull the good and reject the bad. We have not learned all that there is to know in either electricity or metallurgy.

The weather here is quite like California—clear, cloudy, warm and cold by spells. For a few days it will be very cold, down to 10° below zero, then warm and pleasant, all owing to which way the wind blows, and whether the sun is out or in.

◆

Jonah's Gourd.—Commentators, we believe, are pretty generally agreed that the "Jonah's gourd" of the Bible was what is now known as the common castor oil plant. The original *kikayon* translated "gourd" is believed to refer to that plant. Its rapid growth, heavy shading foliage, and the rapidity with which it withers, when injured or cut down, is thought to further favor the idea.

Alaska River—The report of Captain Raymond, of the Engineer Corps, describes the Yukon river in Alaska as the third largest in the world,

The Standish Steam Plow.

[Written for the Scientific Press.]

EDITORS PRESS:—Having some years ago become interested in our swamp and overflowed lands, I have, in the last six years, devoted much thought and study to the proper reclamation and cultivation of the same. Believing that nearly all this work should be done by machinery, I have examined the plans and descriptions of every excavating and embanking machine of note in this country and Europe, as well as of the ponderous engines used in the construction of the Suez Canal, and finding none that would accomplish the work as fast and cheaply as it should be done, I have, as you are aware, invented a machine for ditching and leveeing by steam.

To the matter of steam cultivation, I have given scarcely less attention, having made myself familiar with the various devices that have been put into successful operation, as well as with numberless failures.

Unrivalled in our reaping, mowing, heading, thrashing and other agricultural machinery, we are far behind our English cousins in cultivating by steam. Indeed—must I say it?—behind even benighted Africa—only four steam plows having ever been put into successful operation in the whole United States, though large numbers are employed in England, and at least two hundred were in operation in Egypt seven years ago. Numberless devices have been tried and found wanting, and record of their failures have been published in numerous scientific works. Yet year after year, all over our country, men tread again and again the same beaten track, never once looking at the record, and, therefore ignorant of the lessons to be gathered from the experience of their predecessors, grope their way, as best they can, only to continually reduplicate the story of unsuccessful effort and disheartening failure.

Of all the devices for steam plowing,—and their name is legion,—two only have been successful, and but one entirely satisfactory. Under the former may be classed the Howard and the Fowler plowing apparatus, used in England and Egypt, each of which consists of a gang of plows drawn by stationary engines. Traction engines drawing a gang after them, have thus far been found, after numerous and costly experiments, to be impracticable.

The Fowler and Howard plows may be said to be entirely successful. They certainly plow from fifteen to twenty acres per day, in a more thorough manner, and at less expense per acre, than by the ordinary plow. But these English plows are too expensive for general use. Three have been imported into the United States, at a cost, when put in successful operation, of from twelve to fifteen thousand dollars each. It has been left to California to produce, on an entirely different principle and at much less expense, the only steam plow that can be said to be entirely satisfactory. I do not mean to say that this first trial plow is faultless. Some parts are not sufficiently strong. But the principle upon which it works is regarded by all who have given the matter a thorough examination as greatly superior to that of the English plows, and entirely satisfactory. This plow has lately been at work in this vicinity, and the following editorial from the Petaluma *Argus and Journal*, shows the estimation in which it is held here:

"From the back windows of our sanctum, we look out upon the smoke of the steam plow, as it courses back and forth across the adobe flats, cutting its 12-foot swathe, turning up the annis and soap roots, and leaving them free from dirt, to wither and die in the sun, plowing at times, two acres per hour, and giving the tough, dry, sun-baked adobe, such a cutting and turning, raking and stirring, mixing and whirling, airing and pulverizing, as it never got before, and this, too, with a plow not intended for anything like such heavy work. The adobe has found, at last, its master, and the advent of the steam plow will probably double the value of this class of lands. An acknowledged success in ordinary soil, it was doubted if it would work in adobe. That doubt is now exploded."

Let no one regard this as "rose-tinted" or extravagant. It is correct in every particular. A score of our best citizens attest these facts, as well as the careful and cautious editor of the *Argus and Journal*. Having watched this plow day after day with an eye to its defects, I endorse the whole. It is true, the arrangements for supplying the plow with wood and water were defective. Sometimes the steam would get low, and the plow would be obliged to wait. It is equally true, that a portion of the gearing was weak and frequently gave way. But iron is cheap, and there is no law against making the weak part strong, as an occasional croaker has seemed to imagine. It is a poor brain that supposes these outside and easily-avoided annoyances effect in the least the merits of the invention.

It is true, the old plow is huge and unwieldy. What of that? It was built to test and demonstrate a principle, and it has done so most thoroughly. The drawings for the new plow show that it will be neat, compact, symmetrical and *strong*. There will be no breaking of gearing there. The size and weight, as a whole, has been greatly diminished, while the cutting power is nearly twice as great as before.

It has been perfected at great expense of time and money. The resources of the inventor are running low. Capital, cool, cautious and calculating, is unwilling to invest except upon terms that ignore the right of brain-work to remuneration. Why can not something be done by the Legislature? [Our correspondent will perceive by our last issue that there is already a bill before the Legislature to aid in accomplishing the very thing he devises, in the form of an appropriation of $10,000, to be awarded to the inventor who shall place before the public the best steam plow, provided such plow shall be deemed practical. —EDS. PRESS.]

The introduction of this plow would largely increase our agricultural exports and resources, and add millions to the wealth of the State. Penny-wise and pound-foolish wiseacres may object to it; but an enlightened policy would encourage all inventors, so largely conducive to the welfare of the public. You, yourself, Messrs. Editors, are familiar with all these facts, and I ask for this article the sanction of your endorsement, believing you would thus be largely subserving the public good.

A. B. BOWERS.

Petaluma, Jan. 5, 1870.

◆

Aniline Colors Soluble in Water.—The insoluble colors may thus be made soluble according to Dr. Zinsman: A solution of gelatine in acetic acid of about the consistence of syrup is first made, and the aniline color in fine powder is gradually added, stirring all the time so as to obtain a homogeneous paste. The mixture is then to be heated over a water-bath to the temperature of boiling water, and kept at that heat for some time. Colors in this state, if a very clear gelatine is employed, will be applicable to many decorative purposes. Book-binders, paper-stainers and printers will find them useful. They may also be used to color confectionery and soaps. Before they are used for confectionery, however, it will be well to make sure that no arsenic is present.—*Mechanics' Magazine.*

Oil Boring in Pennsylvania.—"The methods used in boring are constantly changing, and are in some respects quite different now from what they were five years ago. The derricks are built higher and wider, as the wells are generally deeper, and the tools longer and heavier. Wells are bored quicker now than then; instead of five or six months, a well is now bored nine hundred feet deep in forty-five to sixty days. The crude oil is no longer shipped in barrels, but wholly in bulk, in large iron or wooden tanks on the railroad. The refined oil, however, goes in barrels."

Gold and Diamonds in South Africa. The diamond fever in Cape Colony is described in a late Boston letter. The writer says that the natives are searching in thousands, groping about on their hands and knees with iron spoons. White men stand no chance. The writer also gives an account of the gold operations at the Tatin, the fame of which has drawn miners from other parts of the country and from Australia. Some Australians, after going down eighty or ninety feet, struck the vein, and were getting from fourteen to sixteen ounces per ton by crushing.

"J. S." vs. "C. H. A."

EDITORS PRESS:—Ridicule is *not* argument. I shall not, therefore, avail myself of the rather tempting opportunity for the use of this weapon, afforded by the attack of your correspondent "J. S.," the *animus* of which becomes amusingly apparent towards its close. A comparison of this attack with its object, by any one capable of discriminating between positive assertion and the mere expression of opinion, confessedly not irrevocable, will, I think, show that a somewhat strained construction, to say the least, has been put upon portions of the letter.

While I think "J. S." does me some injustice in the charges of self-sufficiency, flippancy and undue prejudice, the letter, at least, of which would not survive the test of personal acquaintance, I freely confess that "querulousness" and "acrimony" do but faintly express my feeling toward that spirit of humbug which fosters the nonsense of "rebellious ores" as a foil to pompous announcements of impending "revolutions in metallurgy;" and, in the desecrated name of science, spreads through the land disgusting capital, discouraging labor, and discrediting our mineral resources.

"J. S." may yet discover, by personal experience, that people without a tithe of his knowledge or ability can obtain, for the crude, abortive conceptions of their brains, that pecuniary aid and favorable consideration which he will with difficulty procure for the finished and proved result of years of patient toil and intelligent investigation. There is such a thing as speculation in processes, as well as in stocks.

With these remarks I dismiss the subject, not to again recur to it unless it should occur to some one to assail the *matter*, rather than the *manner*, of my remarks on rebellious ores and new processes.

C. H. A.

◆

Petroleum Explorations in India.—The English Government has selected Benj. S. Lyman, an American geologist, to make a survey of the oil fields of Indostan, and of the valley of the Himmaleya Mountains. The *United States Railroad Register*, in mentioning the fact, says: "The exceptional character of our Pennsylvanian and Canadian deposits is marked by this enforced selection of an American geologist by the British Government. English geologists are educated in a school of nature rich in coal, but poor in oil. Disturbed and limited, by movements which have been almost incessant in all ages, the English formations are irregular to the last degree; and so cleft and laminated, that nothing of the organic substances, animal and fucoid, when turned to oil, could be retained. But the principal formations were deposited in the ancient seas of this continent under such regular and general conditions, that they spread for hundreds and even thousands of miles, and are superposed with a wonderful conformability. Our oil was forbidden to escape, and hermetically sealed for future use by sheets of mud and layers of clay, hundreds and, in some districts, thousands of feet thick."

Porphyry Pavements.—The Cincinnati *Gazette* says, that in St. Louis somebody had some limestone to sell at four dollars per square, and somebody else some porphyry at twenty-one dollars and eighty-nine cents. It was decided to try porphyry for paving 8,000 squares. Now it is found no better than limestone—indeed not as good—and is already breaking up. The Council is in doubt whether to pay the contractors $14,000 to be released from the contract, or to proceed with the rest of the work. Over $100,000 has already been thrown away.

A Good Idea.—An English physician proposes that druggists be compelled by law to put upon the label of a bottle containing any poisonous substance, not only the word "Poison," as is now done, but also the antidote for that poison, in each particular case; with directions for proceeding in case it is taken by accident, until a physician can be procured.

Pigs.—The pig is naturally the neatest animal on the farm, and yet most farmers compel him to be the dirtiest.

Mechanical Progress.

Improvements in Agricultural Steam Engines.

We condense the following from *Engineering*: "To an unprofessional observer, the portable engine of to-day may appear the same as those exhibited seven or eight years ago; but a careful examination will show numerous points of improvement. Thus, the workmanship generally is better; proportions also are better, and more care is taken to provide ample bearing surfaces and efficient means of lubrication. The pressure of steam carried is gradually creeping up, and portables working regularly at 70 lbs., 80 lbs., and 90 lbs. per square inch are now to be met with. With higher pressure have come improvements in the boiler work. Still there is room for improvement in this direction. We should like to see the practice of placing a large manhole at the side of the fire-box casing abolished, and greater facilities for washing out provided in the form of well-arranged mud-plugs. A mud collector under the barrel of the boiler would do good service, and add scarcely anything to the cost. The flat-topped form of fire-box casing, having the crown stayed directly to the crown of the inside fire-box, which is now becoming a favorite with many locomotive engineers on the Continent, might be adopted for portable engines in many instances with advantage, and with a saving not only of dead weight, but we believe of cost also; while in all engines worked at the higher pressures we hope to see longitudinal lap joints superseded by welded joints or by butt-joints with inside and outside covering strips. All engines, too, should be provided with two safety-valves, and more care should be taken to protect the boiler by efficient cleading. As pressures increase, it will be found advisable to relieve the boiler of the strain due to the working of the engine by connecting the cylinder and crank-shaft plummer-blocks by framing of some kind, the boiler being of course allowed to expand and contract freely. On the Continent this is now very generally done by the fixing of the engine proper on a cast iron base plate, which is in its turn fitted to the top of the boiler.

Then again, we find that steam-jacketing is now becoming the ordinary rule with all the best makers. Arrangements of some kind for heating the feed water by the exhaust steam are now supplied by almost all makers, and the practice of leading the exhaust pipe through the boiler is becoming a thing of the past. In the construction of the details, steel is coming extensively into use, and portable engines with steel crank shafts, piston rods, guide bars, and even connecting rods, are now far from rare."

A French Compressed-Air Brake.—This differs from the one which we have before described. The inventor is Auguste de Bergue: "When the steam is cut off the air may be admitted through adit valves in front of the engine to the exhaust pipes, and thence to the steam chests, where it forms a sort of cushion of resistance, the momentum of the train compressing the air constantly until the whole force is deadened and the cars finally brought to a stand-still. The compression is so even and gradual that all shocks and jerks are avoided, and the stoppage is effected in about the same time as that required by the friction brakes, while the wear and tear upon wheels and tracks is wholly obviated. In cases of emergency it may be reinforced by the hand-brakes, and a train going at the rate of 30 miles an hour be brought to a sudden stand."

Rubber Tubes Made Gas-Tight.—M. Jouanne's method is to give the tube a thin coating of a varnish made by dissolving two parts of gum arabic and one and a half of treacle in seven parts of white wine and three and a half of strong alcohol. The alcohol is added slowly, and at the last,—and with constant stirring, or the gum will be thrown down.

New Boiler Jacket.—One of the latest plans consists in surrounding the boiler with a sheet iron envelope which is larger, and filling the space between with plaster of paris. When this becomes hard, the envelo e may be removed if desired.

Imitations of Damasked Steel.

In a review of Crookes and Röhrig's translation of Kerl's Metallurgy, the third volume of which is just out, the London *Mining Journal* of Dec. 11th thus remarks upon the method in use at the Don Steel Works, Sheffield, to produce imitations of damasked steel: "It was introduced by Mushet in 1801, and consists in melting malleable scrap iron with charcoal and oxide of manganese, in crucibles directly, without using any blister steel. The furnaces are 288 in number, each being of sufficient size to contain two pots, charged with 100 lbs. With the whole number at work, a casting of twenty-five tons weight may be made, the pouring of the 576 pots being completed in five minutes. In order to keep up the supply, the pots are conveyed from their melting holes to the casting-place on small barrows, instead of being carried by tongs, as was formerly the custom. The steel produced is to a great extent employed in making castings for immediate use, such as railway crossings, wheels and bells, instead of being run into ingots to be subsequently worked up under the hammer. The molds used for this purpose are made sufficiently refractory by the use of a thin layer of burnt clay produced by grinding old melting pots; this is applied immediately over the pattern, the remainder of the box being filled with ordinary molding sand. This method of steel casting was first practiced at Bochum, in Westphalia, where it is still carried out on a very large scale. Castings made to pattern, and not intended to be subsequently hammered, must be annealed, and allowed to cool very slowly. A very similar process has recently been introduced in the United States by Messrs. Smith, of Philadelphia, for casting iron, and some artistic specimens recently exhibited at the Boston Institute of Technology excited great admiration."

Forty-Horse Turbine on Thirteen Feet Fall.—Gwynne & Co., London, have built a turbine forty-two inches in diameter to take the place, at a Yorkshire flour-mill, of an iron water-wheel nineteen feet diameter and twelve feet broad. It does double the work with the same amount of water. *Engineering* describes and figures it. We copy part of the description: "The water is conducted by pipes to a cast iron spiral casing which rests on a strong cast iron cylinder with six large openings for the escape of that part of the water which flows out at the bottom of the wheel. This cylinder forms the foundation plate of the turbine, and carries a bearing, lined with lignum vitæ, for guiding the bottom end of the turbine shaft, the weight of the shaft and wheel being carried by a strong thrust bearing at the top. In the spiral casing is fitted the guide wheel, which can at any time be taken out, by unscrewing a few bolts, without disturbing any other part of the turbine, should this be necessary for clearing the water ports or for repairs. The guide wheel has twenty guide vanes, through which the water is directed, in a nearly tangential direction, to the wheels. The buckets of the wheel are formed in two symmetrical halves, joining in the middle in a sharp edge, and the water enters the buckets at this edge, which divides it into two halves, one half flowing through the upper half of the buckets, the other through the lower."

Large Single Standard Steam Hammer. *Engineering* for Dec. 17th illustrates and describes a 4-ton steam hammer recently constructed by Berry & Sons, which is the largest ever made with a single standard. "The standard is built up of wrought iron plates and angle irons, forming a strong box girder which is united at the base to a massive cast iron base plate. The cylinder is twenty-eight inches in diameter and five feet stroke, and is bolted firmly to the side plates of the standard, these plates being made of double thickness at the point of attachment. The cylinder has top and bottom flanges cast on it which fit the upper and lower edges of the side plates, and relieve the bolts of strain. The hammer bar is thirteen inches in diameter, and is forged in one piece with the piston."

Titanic Steel.—The London *Mining Journal* says that one tool made of "Mushet's special steel," the product of the Titanic Steel Co., is equal to about twenty made of any other. Some works are using it entirely for lathe tools and drills.

Scientific Progress.

A Final Zoic Catastrophe.

The following is part of the conclusion to a memoir by Prof. H. Wurtz. We are obliged, by lack of space, to reduce and condense:

"There are chemical changes now active on the earth's surface, whose continuance must inevitably bring about the final extinction of man, and ultimately that of all other life upon our planet.

What furnishes the actual fundamental chemical nutriment or pabulum of vital existence? No chemist will contradict, when I say that it is the carbonic acid of the atmosphere. How long is this going to last? There is one mode of consumption, active and continuous, which will ultimately exhaust the air of its carbonic acid, and thus put an end to organic life. This agency is itself due to vital influences. It is that by which marine animals with calcareous shells or skeletons secrete carbonates from the ocean water, the carbonic acid of these carbonates having been originally derived from the atmosphere. Such carbonic acid thus passes into solid forms, permanent and forever unavailable thereafter. This is where the great machine runs down, and Affinity obtains its final victory over its mysterious antagonist, Vitality.

Whenever the last molecule of carbonic acid produced from the combustion of all the carbon on the earth shall have been locked up in this shape, no form of life now known to us can any longer be possible, and the present Zoic Cycle must end. Comparatively and geologically speaking, the end is near; though millions of years may yet intervene. But long before this end of *all* life, the atmosphere must gradually diminish in its capacity to produce food suitable for man. Man, by burning up the carbon stored in eras past in the earth's *viscera*, is doing his utmost to preserve the status of the machine, possibly even partially and temporarily *rewinding* it; but it must still continuously run down. In the oceanic depths, this precious constituent of the air is continually undergoing

"A sea-change
Into something rich and strange,"

Never to reappear in form available to life, until indeed that time shall arrive when "the elements shall melt with fervent heat;" and, when, under the influence of this heat, the calcic and magnesic carbonates shall be converted into igneous silicates, rendering up again the treasure of carbonic acid in their marble grasp, the atmospheric oxygen, representative of Affinity, enemy of Vitality, shall also then be at least partially withdrawn by oxidation of sulphides and of ferrous oxide; and the earth be thus far advanced in preparation for a new Zoic Cycle."

Mollusks Akin to Vertebrates.—A letter has just been published from Prof. Kupffer, of Kiel, the distinguished embryologist, in which he states that startling vertebrate features are traceable in the early stage of development of a species of *Phallusia* which he has been studying. The new London scientific periodical, *Nature*, says:

"He reserves for the present the details about the exact formation of the nervous system, but quite confirms the fact of the existence of a notochord. He says: 'At this stage one could not imagine a more beautiful model of a vertebrate embryo, with the neural tube on one side of the axis and a visceral tube on the other.' He describes the neural tube as not merely an almost spherical vesicle, but as prolonged in the form of a fine hollow thread into the tail above the notochord or axis."

Dr. Livingstone.—An extract of a late letter from Dr. Livingstone is as follows: "The work to be done is only to connect the sources which I have discovered from 500 to 700 miles south of Speke and Baker's with their Nile. The volume of water which flows north from latitude 12° south is so large, I suspect that I have been working at the sources of the Congo as well as those of the Nile. I have to go down the eastern line of drainage to Baker's turning point. Tanganyika, Nyige, Chowambe (Baker's?) are one water, and the head of it is 300 miles south of this. The western and central lines of drainage converge into an unvisited lake west or southwest of this. The outflow of this, whether to Congo or Nile, I have to ascertain."

Polarization of the Corona.

Prof. Pickering figures and describes, in the *Journal of the Franklin Institute*, the form of the polariscope with which his observations were made. A sheet iron tube is closed at one end with a plate of quartz, and at the other with a prism of Rochon, which has the property of giving two images of any object seen through it, separated by an angle of nearly 3°. We quote:

"Looking through the tube we see two images of the quartz touching, but not overlapping. When the light is polarized, these images assume complementary tints, which vary with the plane of polarization and the thickness of the quartz."

With this instrument, which he says is very delicate, Prof. P. draws the conclusion that the light of the corona is unpolarized. He closes the article thus:

"The strongest argument against the polarization of the corona is furnished by the spectroscope; the presence of bright lines and absence of dark ones, as observed by Prof. Young, denoting incandescence, a view strengthened by the consideration that each square centimetre of the surface of the corona would receive several thousand units of heat per minute. I am well aware that my results are at variance with those obtained by previous observers, including some of the most eminent astronomers of the day, but, as far as I can learn, this form of polariscope has not been used for the purpose, and therefore hope that my experiment may be repeated during the next eclipse."

Another Oxygen Process.—The London *Mechanics' Magazine* has the following: "The mineral sources of oxygen being comparatively expensive, MM. Montmagnon and Delaire have betaken themselves to that cheap reservoir, the atmosphere, and have further availed themselves of the discriminative action of wood charcoal and water on certain saline solutions. According to our authors, 100 liters of fresh wood charcoal will, when exposed to atmospheric air, occlude 925 liters of oxygen but only 705 liters of nitrogen. Now it would appear that when the charcoal saturated with gas is thoroughly saturated with water, there will be expelled 650 liters of nitrogen but only 350 liters of oxygen. Thus we have now left in the pores of the charcoal 575 liters of oxygen and only 45 liters of nitrogen; that is, oxygen practically pure for industrial purposes. To extract the gases, the authors employ a pump, and they tell us that if again exposed to charcoal, the oxygen will be obtained almost pure. There can be no doubt of it. They give no account of the cost of oxygen; but it is clear that it will be represented chiefly by the machinery and the cost of working it."

Molecules, not Structures, Producible in the Laboratory.—The following is from Dr. Debus, before the Chemical Section of the British Association: "Alizarine, the beautiful compound of the madder-root, has been obtained by artificial means in the course of the year by Messrs. Lieberman and Græbe. Results of such a nature render it highly probable that, at no distant period, it will be in our power to prepare, artificially, nearly all, if not all, the substances found in plants and animals. Here I must not be misunderstood. Organic structures, such as muscular fiber or the leaves of a tree, the science of chemistry is incapable of producing, but molecules, like those found in a loaf, or in the stem of a tree, will no doubt one day be manufactured from their elements."

Sheffield Scientific School.—The Geological Department has received,—says the last annual report,—several very valuable additions. Among these, the most remarkable is a slab with twenty-one footprints of the Otozoum upon it, each of which is about fifteen inches in length. The slab is of a correspondingly gigantic size, measuring twenty by thirty feet.

Photographs of the Megalithic Monuments.—At a recent meeting of the Ethnological Society, London, it was stated that a scheme is in progress to obtain funds for the purpose of procuring a series of photographic representations of the megalithic monuments found in England and France, and if possible in other parts of Europe and in Algeria.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

CLAIM SOLD.—*Chronicle*, Jan. 8th: The Good Hope has been sold to H. F. McCarty for a Philadelphia Co. This claim is in the Alpine District, three miles from Markleeville. We learn that work will commence in a short time.

COMMENCED.—On Wednesday work was commenced on Buckeye No. 2 claim by the Exchequer Co. of London. On Monday, additional men will be put on.

GOOD AVERAGE.—Some ore from the Pennsylvania mine assayed at Silver City averaged $62.99 in gold and silver to the ton.

SCHENECTADY.—*Miner*, 8th: Fine ore is now being taken out. Rumor has it that the building of a quartz mill will be commenced by the Co. within the next 60 days.

TARSHISH.—The same journal gives a history of the ore deposit from '62 to date. The Monitor C. M. Co. and the S. S. M. Co. are now taking out the genuine Tarshish ore, and skeptics in regard to its value are advised to reserve their decision for a few months.

AMADOR COUNTY.

ONEIDA.—*Ledger*, 15th: We learn that the mill will soon be started again. During the past month extensive repairs have been made, and it is in splendid order. The shaft has been pushed with vigor, and is in condition to be worked to advantage.

WATER.—We learn that a survey is to be made to bring the Butte ditch on the hill above Sutter Creek for the quartz mills.

BUTTE COUNTY.

REPORTED RICH STRIKE.—Oroville *Record*, 15th: We hear a rumor that the Cherokee Flat Blue Gravel Co., have struck dirt that will pay by the million. They are tunneling into Table mountain, and are liable at any day to break through the rim rock into pay dirt. If the reports are true, Cherokee has quadrupled in value.

THE RAIN.—The miners at Cherokee Flat commenced washing on Thursday morning, but they will not be able to work many days unless the rain continues.

CALAVERAS COUNTY.

RAILROAD FLAT.—*Chronicle*, 15th: Chapmen & Co. are negotiating for additional machinery; the engine at their mine not being of sufficient power. "Salty" & Co. have been taking out very rich ore; the walls enclosing the vein and vein-matter, are ten feet apart and present unmistakable indications of a true vein....Sundermyer & Co. discovered a new vein, parallel with their mine, near Wet Gulch. The ledge was considerably broken up at the surface, but in a few feet a solid vein appeared, a foot wide, containing considerable gold, visible to the eye....Jerome ——, struck rich gravel near Nelson's Gulch, in a ravine which has paid well, up to a lava formation. He sunk a shaft through the lava 30 feet deep, finding gravel on the bed-rock which prospects as high as $4 to the pan....The sulphuret works of Mr. Thoss, at West Point, are expected to be running this week. Several lots of heavy sulphuret ore are in readiness here, to test the efficiency of the "Thoss process."

EL DORADO COUNTY.

OREGON HILL.—Placerville *Democrat*, 15th: Shepherd & Co. are still hammering away with the Pacific mill on rock from the Oregon Hill mine, to the tune of from $2,000 to $3,000 per week.

GOLD DUST.—Shipped, last week, from this place, $9,000. The amount shipped in 1869, $410,000. The total yield for El Dorado county for that year will not vary much from $1,000,000.

INYO COUNTY.

CERRO GORDO.—A Los Angeles telegram dated 11th, says: Five tons of argentiferous galena arrived this afternoon from the Union Smelting Works at Cerro Gordo.

LOS ANGELES COUNTY.

JAPALA—A telegram dated 13th is as follows: An average assay of rock from a newly-developed ledge in the Japala Silver mine, gives $188 to the ton. It will soon be actively worked.

NEW STRIKE.—Telegram, 15th; Rich diggings have been struck near Soledad cañon, three miles from Sears' mill, by two Mexicans. They took out $450 with one mule and a very small arastra, from three tons of rock.

NEVADA COUNTY.

BOWERY.—Grass Valley *National*, 12th: This company are now taking out ore from drifts in the 72-foot level, which will pay $100 to the ton. They are hauling to the Gold Hill mill. A crushing of 95 tons, made a few weeks ago, yielded over $100 per ton.

WHITE PINE.—This ledge, near Deadman's Flat, will be prospected again. Lumber is being hauled to the ground, and it is the intention to commence sinking a shaft.

WM. HENN MINE.—Same of 15th: We saw a load of excellent ore, from this mine, to-day, being hauled to Larimer's mill. Gold in abundance could be plainly seen. The company are now down over 200 feet, and prospects are flattering.

O'CONNOR.—*Union*, 13th: We saw some rock yesterday at Ben Macauley's mill, from the O'Connor, or rather the Grass Valley Consolidated mine. Good judges say that the forty tons will give $30 per ton. The hoisting works are complete and in good order. A thirty-five horse power engine is used. The ledge is from 3 to 6 feet thick, and is opened up by drifts and shafts extensively.

WEST EUREKA MINE.—Same of 16th: Work is being prosecuted with vigor. The ledge in the shaft looks well, and bears heavy sulphurets. In a week or two the miners will commence drifting.

MANZANITA CLAIMS.—*Gazette*, 13th: Marselus & Maltman started up their hydraulic works last week. The apparatus is of the most improved style. They have one of the (32-inch) Globe nozzles, and are running from 650 to 700 inches of water. This is forced through an aperture of 5⅞ inches in diameter, the head being 175 feet. The stream is of immense power, and does 50 per cent. more work than the same amount of water with the same head would do if divided into four streams. They have fifteen Chinamen employed. In addition they employ four or five white men, who are engaged in blasting. There is a deep bed of pipe-clay lying over gravel, which is blasted out, and then picked into pieces that will run through the flumes. The entire length of flume is 3,500 feet. The tunnel has been run 1,100 feet, and another year will be required to complete it. On the first of January, the running was suspended, but will be resumed if sufficient rain falls to warrant a fair supply of water. Mr. Maltman thinks we have scarcely commenced placer mining in this county.

CHANCE FOR MINERS.—Same of 15th: The California mine, mill and hoisting works will be leased on favorable terms. The mine is in good condition to work; the machinery is new and of the best kind.

PLACER COUNTY.

NEW AND RICH DISTRICT.—Grass Valley *Union*, Jan. 14th: A party organized here three weeks ago for prospecting, report success, having struck quartz in the eastern part of Placer. A location called the Champion has been made, and rock brought to this place to be tested. The Champion is from two to six feet thick, and stands almost perpendicularly. It is so situated as to be easily drained, and convenient to it is all the water needed for hoisting and other purposes. The prospectors, who are men of experience, are sure that they have discovered a district which will be one of note. The rock shows beautifully in free gold, and is not picked rock.

PLUMAS COUNTY.

RUNNING.—Quincy *National*, 8th: We hear that Judkins & Kellogg have rented and are running the Caledonia quartz mill. They are also extending their ditch to the McClellan ravine.

A SLUG.—Waggoner, in the old Cummings claim on Dutch Hill, took out a 28-ounce chispa one day last week.

ENGINE.—The Indian Valley Co. (Blood & Treadwell) has a water engine on the way to furnish power for the mill. It weighs about 7,000 pounds. The owners expect to have it running within two months. It is a recent invention.

EXCITEMENT.—Messrs. Banker, Lowrey & Whittaker have struck a pay streak in the gravel in one of the ravines opposite Greenville, and are now averaging about a half ounce per day to the hand. A large number of claims, covering acres of ground, have been located. As soon as a supply of water can be had, the claims will all be worked.

SAN BERNARDINO COUNTY.

COSO.—Los Angeles telegram, 12th: Receipts of bullion and dust here are quite large, a steady yield of dust and small lumps of gold being received from the Coso mines, San Bernardino county.

SIERRA COUNTY.

NORTH SIDE—SLATE CREEK.—Gibsonville cor. of *Messenger*, 15th: Cook's tunnel at Whisky Diggings is in 700 feet, and progressing. Next above and running for the same ridge is the tunnel of Messrs. Porter, Brown & Stewart. This was several years ago run 900 feet, when work was suspended. It is now resumed in a business-like manner. Gravel was struck near the commencement, but very little pay found, and the present object is to push ahead in search of a more extensive channel in the rear. Old Pilot Tunnel No. 1, run in 500 feet to hard cement ten years ago, is being opened again by Hoffenden, McDonald and others, under a belief that the cement formerly struck is but a narrow dike with a gravel channel behind it. The Niagara claims are laid up. The North American Co., with a large yard of gravel, is awaiting water. These claims lie so high that only the melting of snow will give a supply. They have 800 feet of their new tunnel completed. Phœnix and Gem Redding companies are said to be getting out first-class gravel. There is not much doing in the old Swiftsure claims. One or two are skirting about for pay gravel. The Nevada Co's lower diggings, which they work through an incline from their tunnel, have been flooded since water to run their wheel failed them. They have them cleared, and are at work below now.

GRASS FLAT DISTRICT.—The same journal publishes the new laws of this district, formerly known as Gardner's Point District, which were adopted at a Miners' Meeting held on the 6th of November last. Ten dollars in coin or work, holds a claim for one year, each year dating from December 1st.

SISKIYOU COUNTY.

QUARTZ.—Yreka *Union*, January 14th: It is rumored that a good vein of quartz has been struck near Maxwell's mill, Shasta Butte. Pieces of float rock, containing gold, have been found in that vicinity for the last seven or eight years.

Arizona.

POINTER.—Prescott *Miner*, January 1st: We are indebted to "Uncle" Billy Pointer and Thos. W. Boggs for specimens of ore from the Pointer lode, Walker's District. One is decomposed, showing free gold; the other is said to contain plenty of gold in sulphurets.

PROSPECTING PARTY.—To-morrow, some 25 or 30 frontiersmen will start for the country north, with the purpose of giving it a thorough prospecting.

BIG BUG.—Messrs. L. C. Gray and F. H. Wunderlich arrived in town Thursday, from Big Bug District. When they left, the mill was running. It was crushing ore from the extension claim on the Eugenie lode. The ledge was looking first-rate. Hitchcock and McCarthy, who were running the mill, were well pleased with the prospects.

VULTURE.—A Los Angeles telegram of the 17th says: Three hundred ounces, gold bars, were received from Arizona within the past few days, by one house. A large portion of it was from the Vulture mine.

Colorado.

AT GOLD DIRT.—Boulder *News*, January 4th: We learn that Sam. Conger has discovered another silver lode between the Boulders, with a large crevice, samples from it assaying over $15,000 per ton. The Grand Island lode has been worked the past fall, and the ores hauled to Black Hawk, 18 miles, and sold to Prof. Hill, netting the miners over $100 per ton, when properly assorted.

SMITH & PARMELEE. — Central City *Herald*, January 4th: The ore lately taken from the mine has given a larger yield than for some time back. About sixty hands are now employed; the largest force by any single company in the mountains. The 25 stamps are kept at work to their full capacity, night and day.

BALD MOUNTAIN.—The warm weather has enabled the mills in Nevada and Black Hawk to resume work. Chatfield is running Pyrenees quartz. Whitcomb, Clayton's, and the Quartz Hill companies are running to their full capacity. The latter has a new pump, which supplies all the water wanted.

MINING ITEMS.—Georgetown *Miner*, 6th: The Par is turning out large quantities of very rich ore....Huepeden & Co. shipped, during December, silver bullion $5,951.74, coin value....The grading for the new reduction works of Stewart is progressing. ....A new discovery has been made on Sherman mountain, the surface ore of which assays $76.27 per ton....The new shaft on the Caledonia is being sunk with good results. The walls are well defined, and the ore deposit is looking well....The Monster lode crevice is wider and the mineral deposit stronger than was supposed....Frank DeLamar presented us yesterday with some fine specimens of ore from the North America lode. Work is going on rapidly on the lode.

BULLION FOR 1869.—The same journal gives a full report, with details. The total value of bullion, gold dust and ore shipped during the past year, is $400,000.

SHERMAN MOUNTAIN.—An assay of selected ore from the E Pluribus Unum gave a yield of $4,500 per ton, and 65 pounds of very select, treated at Stewart's, by smelting in crucibles, gave a yield of $13,000 per ton.

EDGAR MOUNTAIN.—At the Bank may be seen specimens from the Shaffter lode, with metallic gold, that would in California create a sensation. Yet the shaft is only 15 feet deep. Ten tons of ore are now under treatment at the Fairmount mill.....Discovery shaft on Edgar lode is 74 feet deep. Drifting is going on at 42 feet. It is a true fissure vein, with a strong deposit of pay mineral.

REPUBLICAN MOUNTAIN.—The Toronto tunnel cuts the trend of the richest belt of lodes in the country....A contract has been let to drive Griffith tunnel 300 feet.... Par tunnel is to be driven 600 feet further.

ITEMS.—Central City *Register*, 13th: The Franklin Co.'s mill in Gilson gulch has been running on Seaton ore with success.... Brastow's stamp mill in Lake gulch is running on ores from the California lode, Nevada, for Stalker. Cheney is repairing his mill....Chas. H. Morris has accepted the management of the Whale mine....L. A. Klein, of the German claim, brought in a pan heaped full of specimens that fairly glistened with the gold, which was all through them. The weight is about eighteen pounds, and the value estimated at $500.

GILSON GULCH.—We saw nearly a thousand ounces of silver retort the other day at the Franklin mill. A lot of Seaton ore assayed 300 ounces to the ton....The Freeman lode has 4 to 6 inches solid ore.... The parties who have leased Kinney's claim are down 120 feet, and have a vein 6 to 10 inches wide which is worth 120 ozs. per ton.

Montana.

BULLION FOR 1869.—*New North-West*, Dec. 31st: Deer Lodge county produced in 1869, $24,270,000 in gold, besides $100,000 in silver from Philipsburgh.

RUNNING.—The James Stuart mill at Philipsburgh is running constantly on Hope ore. The machinery is in excellent order. Times are brightening.

ROCHESTER.—Cor. of same: Hendree & Woodworth's mill is pounding away on rock from the French lode. Hitchcock & Williams are running a tunnel on Kitty Redus lode, taking out fair quartz. Lewis & Marshall are sinking on the Fellowcraft.

CEDAR CREEK MINES.—Correspondents generally confirm the reports of the richness of the new mines. "Old Stone" says jumping is going on, and that before June 1st there will be hard fighting. Claims have also been taken up in Oregon gulch, the north fork of Cedar creek. Few claims have been opened yet. No chance left to get claims, though there will probably be plenty in the spring, for many of the farmers of the county own claims. He thinks it will be as good a camp as Alder.

HIGHLAND GULCH.—Little doing, except on the Only Chance lode, and in the gulch below town. In Basin gulch, Allen, Mills, and Boyer have struck pay, and Leach & Hotchkiss have refused $5,000 each for their ground.

PHILIPSBURG.—Cor. of Helena *Gazette*, Jan. 16th: The mill is running; but three more might be added without pressing the mines, or reducing the price of crushing. The present machinery will reduce twenty tons per day; at $20 per ton, here is $400 per day, while the cost cannot be estimated at more than $120.

RADERSBURG.—Cor. of same: There has been some excitement in this camp within the past few days, over the discovery of new diggings in Keating gulch. As high as three dollars to the pan has been found.

THE NEW MINES.—A Cedar Creek letter from James and Barney Haney says: "On No. 14 above discovery the pay streak is 32 feet wide and 7½ feet of gravel, and on No. 26 it is 4½ feet; above this there is not more than 2 feet of gravel. There is water on 9 miles of the gulch, when it sinks and there is none on the 3 miles below. The highest prospect found on Nos. 14 and 26 above discovery, is twenty cents to the pan. There are from 50 to 60 men coming and leaving the gulch every day."

"Stampeder" writes that the accounts are very conflicting. Another writes that the whole county is staked off, and that every man must be there by May 15th, or his claim is jumpable. Another says the gulch is narrow and the claims shallow. John Wing writes: "The more I see and hear the more I am convinced of the uncertainty of there ever being much of a camp here. Indeed, the chances are ten to one that it will prove a small camp, and probably a second Elk Creek bilk. To say the least, if the mines are extensive, they have yet to be found."

MORE BRICKS.—We saw yesterday, at the banking house, two nice gold bricks. One was the product of the I. X. L. mill, and turned the scale at 192 ozs. The other belonged to the Whitlach Co., and was the result of their last run in the Diamond City mill. This weighed 172 ozs.

Idaho.

FLINT DISRICT.—*Tidal Wave*, Jan. 13th: From. W. H. Clark we learn that Flint is still alive. The Baldhead, the Faderland, the Never Sweat, the Tenants in Common, the Justice, and two other companies, are at work. Clark brought over the result of his first clean-up from the Twilight, which we hear looked healthy. There is a report that the Rising Star intends to resume work in a short time.

Nevada.

COPE DISTRICT.

ORE.—Elko *Independent*, Jan. 12th: Six tons of ore from the Mountain City Mine, reached this place yesterday. It is to be forwarded to San Francisco for reduction.

MILLS.—The Atchison & Drew mill, at Mountain City, is running on good rock, and the Canty mill will be started to-day on choice ore.

NEW DISCOVERY.—We learn that George Cowles has discovered a fine quartz ledge seven miles from Mountain City, in the direction of Bull Run. The ledge comes up boldly, and the top rock assays $350 to the ton in silver.

MINING SALE.—Same of 15th: One hundred feet in the Argenta mine was sold last week to Dixon & Riley for $5,000 in coin.

HUMBOLDT.

GOLD RUN DISTRICT.—*Register*, 15th: A shaft 67 feet deep has been sunk on the Register vein, which, at that depth, is three feet wide. The ore is argentiferous galena, and averages 60 per cent. lead, and from $49 to $60 per ton silver. Several tons have been shipped to San Francisco.

RAILROAD DISTRICT.—*Independent*, 13th: R. F. Hafford this week brought some gorgeous specimens of copper-silver ore from the Indian Chief, a ledge discovered thirty days ago near the summit of the railroad range. The vein is six feet in width, and shows a regular foot-wall at the surface. The ore assays in silver from $60 to $170, and averages 50 per cent. in copper.

REESE RIVER.

BULLION.—*Reveille*, 10th: Yesterday the Manhattan Co. shipped six bars of bullion, and to-day five more, which, with the six bars Saturday, make the total $29,674.54, shipped overland to New York.

SECRET VALLEY ORE.—Same of 11th; We gave last week the working of fifteen tons of ore, which averaged $550 per ton, produced by the Corwin & Paige mine. We were shown last night three samples of ore from as many claims. The miner who exhibited the dark, waxy looking rich ore. told us of several large lots that were about to be hauled to this city for reduction, the yield of which has been estimated at over $650 per ton.

HOT CREEK.—Same of 13th: This district is again attracting attention. We learn of important operations to be commenced in the early spring.

SARATOGA.—Same of 15th: This mine, one of the early locations on Lander Hill, belongs to the New York and Austin Co. The lessees have tapped a chimney of superb ore. Twenty tons have just been worked at the Manhattan mill, the first class of which—a small lot—yielded upwards of $3,000 to the ton. The yield of the second class was large, but we have mislaid the figures. Even the finely pulverized matter, which is usually thrown upon the dump, yielded at the rate of $238 of silver per ton.

BULLION.—For the week ending this date (15th) the Manhattan mill produced 16,472 ounces of bullion.

WASHOE.

OPHIR.—*Enterprise*, 11th: The company are hoisting away again with two tanks. The pump is also kept in constant operation.

IN OPERATION.—Same, 13th: Nearly all our mills are in full operation on ore, principally from the Comstock range—though several so-called "outside" mines are yielding good ore.

GOULD & CURRY.—14th: An assessment of $15 per share is levied.

The Mariposa mill, on Cedar ravine, is now running on Hale & Norcross ore, and the Summit mill on ore from the Sacramento, Cedar Hill.

SUTRO MINE.—16th: A considerable amount of ore has been taken from this mine and will be sent to the Evans mill, on Cedar ravine, below the Mariposa, this week for crushing.

WHITE PINE.

WEEKLY MINING REVIEW.—*News*, 15th: Nothing startling for the week. We are just now in the hibernating condition, and a few weeks of dullness must be counted upon. The bullion shipment for the week is very light—$46,397.33. Operations are resuming in almost every one of the undeveloped mines.

BULLION FOR THE YEAR.—Total shipped from White Pine District for 1869, is $1,938,888.44. That shipped from the 20-stamp mill at Newark is not included in this statement.

ITEMS.—Aurora Consolidated takes out 20 tons per day. Ore improves in quality. ....Aurora South has 5,000 tons on dumps, and work is progressing favorably....Auburn has 200 tons out, and waits for a mill. ....Farewell is now shipping ore to the Chicago mill....The agent of a New York Co. has secured the Grant & Colfax.... Original Hidden Treasure talks of a tunnel. ....Mountain Boy shaft 20 feet down. Ore to be worked at Staples' mill....Minor's Dream wants ore milled....Manhattan is pushing work vigorously....Mineral Point has rich base metal....Vulcan has struck it at 18 feet....Pogonip & Othello have shut down until Spring....Silver Vault prospect was never better.... Truckee has 50 tons on dump; has suspended operations for 60 days.

MILLS AND FURNACES.—Wiland & Co.'s furnace has resumed operations. Now running on ore from the Cody and Imperial. Capacity, 3½ tons bullion in 12 hours. Shipment this week, 18 tons bullion of average of $94 silver silver the ton of metal....Rathburn & Co's furnace has been relined, and was fired yesterday....Van Wyck & Co's furnace will start up next week....Silver Springs smelting works at Shermantown, are again in full blast....The Hawthorne Co. has nearly completed its furnace....A smelting furnace has been in operation for ten days in Clover District....Staples Mill Co. have bought the dump of the Sagebrush mine, containing 300 tons of fair ore. ....Bartlett & Vreeland mill is working ore from the Hemlock mine, on Pogonip Flat.

OUTSIDE DISTRICTS.—*News*, 15th: Outside districts are languishing for want of capital—except, perhaps, Eureka, Egan, and Ely. The latter has met with a check in passing below base and finding free milling ore, just as its large smelting works were in full blast. Egan is proving more extensive and richer than it was thought to be. Eureka is building furnaces at a rapid rate, and is already shipping base bullion. Cave, Patterson, Robinson, San Francisco, Nevada, Warren, Snake, Silver Cañon and Silver Creek districts are noiseless. Robinson (41 miles east) has a new 5-stamp mill, motionless, incomplete, and under attachment. Silver Park and Shoshone will each have two mills early in the spring; and Cooper, Sacramento, Piermont and Kern each expect one.

New Incorporations.

The following have been recorded in the Secretary of State's office, Sacramento:

NENADA AND MOUNTAIN LAKE ICE CO.—Jan. 10. Capital stock, $100,000. Place of business, Nevada City, Cal. Object: To procure and sell ice, pack and refrigerate meats, and buy and sell stock in California and Nevada.

HARTWELL M. CO.—White Pine, Nev. Jan. 6. Capital stock, $1,680,000. Trustees: Geo. F. Hartwell, Chas. B. Gould, Henry J. Young, Joseph Fuller and David Avery. The principal place of business to be in San Francisco.

HOME PILE TUNNEL CO.—White Pine. Jan. 6. Capital stock, $1,640,000. Trustees: James Brodie, L. W. Kline, John Hay and Anson Scholfield.

THE PIUTE M. AND M. COMPANY.—Piute district, Nev. Jan. 11. Capital stock $1,600,000. Trustees: E. P. Swett, W. A. Dunbar, Edward Read, B. J. Hull and W. D. Read.

CAL. PACIFIC STEAMBOAT CO.—Jan. 11. Capital stock, $1,000,000; to continue five years. The trustees for the first year are D. C. Haskin, James W. Ryder, Wm. F. Rolofson, J. P. Jackson, Francis Avery, L. C. Fowler and D. W. C. Rice. Place of business, San Francisco and Vallejo. Object: Navigation of the waters of the San Francisco and San Pablo Bays, the Straits of Carquines, and the Sacramento and Feather rivers, with steam vessels and barges.

CALIFORNIA SILK CULTURE ASSOCIATION. Jan. 13th. Capital stock, $250,000. Trustees: Henry Hamilton, Thos. A. Garey. Geo. J. Clark, John H. Stewart and Dudley Pine.

SAN DIEGO BAY-SHORE R. R. CO.—Jan. 13th. Capital stock, $100.000. Directors: Levi Chase, S. S. Culverwell, E. W. Morse, W. A. Winder, W. Jeff. Gatewood, J. S. Menassec and Geo. A. Johnson.

GEARY STREET AND OCEAN R. R. CO. Jan. 19th. Capital stock, $80,000. Trustees: J. B. Haggin, H. S. Gates, John A. Wise, Geo. A. Rossiter and Tyler Curtis.

The following have filed articles of incorporation with the County Clerk, S. F.:

CALIFORNIA PAVING CO.—Capital stock, $500,000, in 500 shares of $1,000 each. Trustees: J. T. Doyle, A. W. Von Schmidt, A. S. Hallidie, James P. Flint and John Heuston, Jr.

FATHER MATTHEW TOTAL ABSTINENCE AND BENEVOLENT SOCIETY.—Jan. 18th. Trustees: Thos. H. Gallagher, Peter Rafferty, Thomas Davenport, Edward V. Poole and Joseph Boyd.

WEST INDIAN BENEVOLENT ASSOCIATION. Jan. 18. Trustees: R. E. Muir, Wm. J. Simmonds, Jas. E. Francis, E. F. Carleton, Wm. Smith and Edward Hall.

Meetings, Elections, Etc.

AMADOR M. CO.—Jan. 17th. Trustees: J. D. Fry, President; Thomas Bell, Vice President; M. J. McDonald, J. W. Gashwiler, M. Reese. J. F. Lightner, Sec., and John A. Faull, Supt.

CONSOLIDATED VIRGINIA S. M. CO.—Jan. 6th. Trustees: Thomas Bell, Solomon Heydenfelt, Wm. E. Barron, A. K. P. Harmon and H. J. O'Reilly.

CALIFORNIA INSTITUTE OF ARCHITECTS. Jan. 17th. President, D. Farquharson; Vice President, S. C. Bugbee; Corresponding Secretary, L. R. Townsend; Recording Secretary, W. H. Williams; Treasurer, S. H. Williams.

San Francisco Mining Stock Market.

The market for mining stocks, during the past week, has been tolerably active, if we take into consideration the present state of the weather and the rather apathetic feeling which has prevailed for some time past. Chollar-Potosi and Yellow Jacket were extensively dealt in, early in the week selling at an advanced price; but toward the close a recession in price is noticeable. Savage, Sierra Nevada, and Original Hidden Treasure also sold to a large extent.

CHOLLAR-POTOSI—has been prominently before the Board. During the week closing January 14th, 1,073 tons of ore were extracted. We have nothing new to report from the ore-producing localities. Work at the new shaft has been carried on in day-time only, but by the 20th they expect to have everything in readiness to continue operations day and night. On the 14th they sent forward bullion amounting to $20,647 49, and on the 18th, $11,620 85.

BELCHER—also ruled active toward the close, at a slight recession. On the 18th inst. the first bullion for some time past was dispatched to the office in this city, being valued at $6,131 87. They have sent 906 tons of ore to the mill, leaving 200 tons at the dump. At the above date the stope was reported to be twelve feet thick and of good quality. ——CROWN POINT also exhibited increased activity toward the close at a reduced price. On the 15th inst. the main east drift from the shaft, on the 1,100 level, was in 655 feet—face in porphyry; and the east drift from the 1,000 level had attained a distance of 500 feet, the face also showing porphyry.

GOULD & CURRY—attracted few buyers. For the week ending January 16th, 452 tons of ore were extracted. In the southwest drift, on the seventh station, the quartz indications have given out, and they have come to heavy clay and porphyry. In the northwest drift, same level, on the 18th inst., they found a small bunch of quartz, which shows no metal.

HALE & NORCROSS—was dull of sale. During the week closing January 15th the mine yielded as follows: Upper mine, 175 level, 76½ tons; 300 level, 127; lower mine, third level, 16½; fifth level, 4½; sixth level, 1,185½; total, 1,410 tons. On hand at dumps, 6,505 tons of ore, of which 2,309 is low grade. The mine continues to look well.

SIERRA NEVADA—commanded considerable attention during the past week, at quite firm rates. Letters to the 15th inst. state that the east gravel deposit is proving to be a large body, and is reported to show good prospects. The Superintendent thinks it of more importance than the west body. For the week ending the 14th inst., 10 tons have been taken from the ledge, and about 423 from the gravel deposit.——OVERMAN is not in large demand. It is stated that the improvements in the "raise" on the 500 level continue to look well. The yield of ore from that point for the week has considerably increased, having extracted 710 tons.

Mines of Missouri.

The value of the mineral deposits of Missouri are hardly appreciated by the world in general. The immense amounts of iron and lead and other metals will some day give large returns and add greatly to the wealth of the State. We mentioned, some time ago, the discoveries of tin there, which promised well. From a private letter of a mining engineer of considerable experience and talent, a graduate of Freiberg, we make the following extracts:

I could have shown you as big a thing right here in the midst of civilization, as you found anywhere in those Rocky Mountain regions. I do not refer to actual mountains of iron or of lead, although we have those here, but to tin. Will you believe me (whatever the papers may say on the subject) when I tell you that we have here inexhaustible quantities of ore, resembling the Altenberg (Saxony) tin Zwitter [or "Stockwerk," where the ore impregnates the rock to quite a distance around the veins, and the whole mass is treated.—ED.], but containing from 3 to 5 per ct. of tin. (?) I have satisfied myself by upwards of thirty assays, made from average specimens which I broke off from the lode and conducted by myself in such a way that "salting" was an impossibility. Analysis of the button, obtained by assay, gave a slight trace of iron as the only impurity.

The above is in a very favorable situation for working. A couple of mammoth lodes, cut perpendicularly through a mountain about one thousand feet high, at the base of which is a fine little river, furnishing water enough for as extensive a dressing-mill as may be desired. The mining can all be done by adits, and the ore be dumped directly into the crusher feed-box, and pass *downward* through the whole process, until the metallic tin finally runs out of the refining kettle into molds at the bottom. The mines are only eight miles from the railroad. * * *

Times have been dull this season in Missouri, so far as mining is concerned, except for the iron men. Several new furnaces have been and are being built at Carondelet, and a host of new iron banks have been opened along the railroad lines. * * * The great lead mine of the United States, the *Mine la Motte*, a tract of 26,000 acres, and unlimited lead, nickel, copper and iron deposits thereon, changed hands this summer, and operations on a large scale are now being carried on. * * * The lead deposits of this State are very rich and very extensive; but the slovenly and desultory way in which mining is carried on, hides them under a bushel, as it were. * * *

This want of engineering skill has been the great draw-back in Missouri. People there are unwilling to go to the expense of getting educated engineers, and hence waste a great deal of money by not knowing how to manage. Hitherto operations have been carried on in a miserable manner and at odd hours by anybody. In fact, there are but one or two mines there which have been conducted at all properly. But the deposits are immense and very rich, and the numerous railroads, which run through the State, render easy access to the great markets.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

Cashmere Goats from the East.

By the Colorado, from Panama, on Thursday last, there arrived at this port a large importation of Angora or Cashmere goats, direct from the region of the Black Sea, where this superb wool-bearing animal flourishes in its highest perfection. The entire number which reached here was 90. They were from the provinces of Angora, Castambar, and Babyzar. They were taken, in teams, direct from the steamer to the 17-mile house on the San José road, where they will remain about 20 days, and where a portion of the flock will be offered for sale. Those remaining unsold after that time, will be taken to the ranch of Butterfield & Son, on the San Bonita creek, Monterey county.

Some of these animals were driven 800 miles to reach Constantinople, their first shipping point, from whence they were shipped to Liverpool, and thence to this port, *via* New York. About thirty head died during the transit—twelve between here and New York, mostly young kids, from the effects of Isthmus water. We inspected them at the steamer the day after their arrival, and were surprised at the remarkably good condition in which they appeared after so long and tedious a trip. Their condition, under the circumstances, fully demonstrates the hardiness and vigor of these animals. Messrs. Deihl & Brown were the importers.

Messrs. Butterfield & Son have a large number of these animals on their ranch, of various grades, such as seven-eighths, five-sixths, and higher up to full-blooded. They have now about 200 rams fit for service. Mr. B. assures us that these animals do even better in this State than in their own country. The introduction of blooded sheep and goats into California is worth the attention of wool growers throughout the Pacific coast. The fleece of these Cashmere goats commands a high price, and the breed is invaluable for mixing with our common breeds. The efforts of Mr. Butterfield, and other stock masters, to improve our breed of sheep and goats is most praiseworthy, and cannot fail to lead to important results in the rapidly increasing wool-growing interest of this coast. We shall have something to say at an early day with regard to the facilities which our foot-hills present for this business.

Improvement of Grain by Natural Selection.

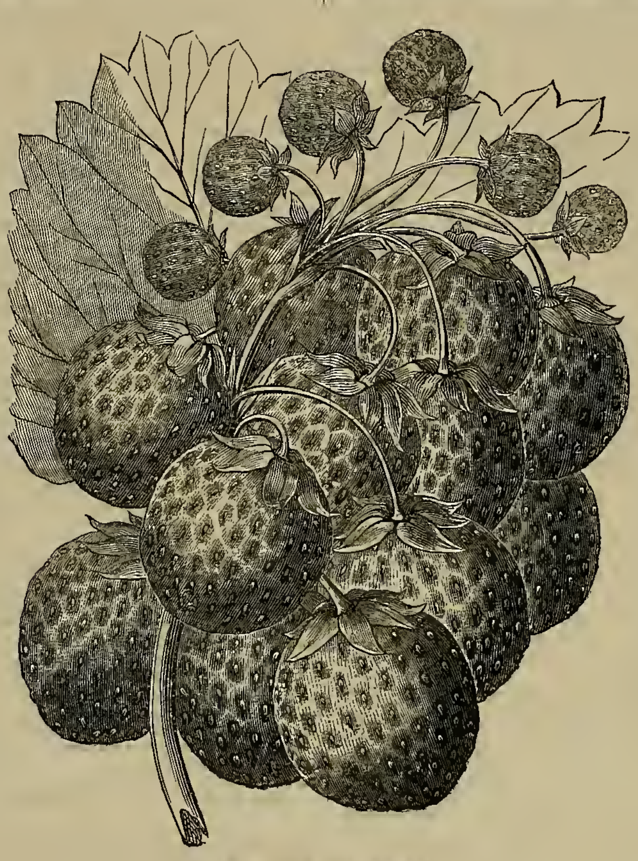
At the Exeter meeting of the British Association, Mr. Hallet, of Brighton, read a paper giving an account of his experiments upon the improvement of grain by applying the principles of "natural selection." By this method he succeeded in obtaining a grain of wheat, which, when sown, produced a whole multitude of stalks, each of which bore a magnificent ear well filled with grain. The quality is maintained by the descendant seed, and the produce is thus increased more than a hundred fold. Mr. Hallet lays down the following principles as the result of his observations:

1. Every fully developed plant, whether of wheat, oats or barley, has an ear superior in productive powers to any of the rest on that plant. 2. Every such plant contains one grain which proves more productive than any other. 3. The best grain in any plant is found in its best ear. 4. The superior vigor of this grain is transmissible in different degrees to its progeny. 5. By repeated careful selections the superiority is accumulated. 6. The improvement, after a long series of years, reaches a limit. 7. By still continuing to select, the improvement is maintained, and practically a fixed type is the result.

WINDSOR FOREST has about 1,700 deer. The Athol Forest, in Scotland, has 30,000 deer on its 80,000 acres.

The Strawberry.

Fifty years ago we were dependent for this delicious fruit almost entirely upon the four or five wild species which were found growing, naturally, in the fields. Indeed, it is only about thirty years since any special efforts were made on this continent to produce new and improved varieties from seed. The country owes a debt of gratitude to Mr. Hovey, who was one of the first to move in the matter, by the introduction of his famous Hovey's Seedling. The narration of what has been accomplished since that time would require a volume. It is wonderful to compare the small, seedy, dry berries—the best known forty years ago—with the large and luscious varieties which are now numbered by hundreds. Careful and improved cultivation has not only improved and increased our varieties, but has been equally successful in increasing the yield from a given vine or tract of ground.



THE COLFAX STRAWBERRY.

There is no fruit in the world that is grown so easily, so successfully, or so economically, in every country and clime, as the delicious strawberry. While it adapts itself more perfectly and more readily than any other to the varied conditions of climate and soil, it is, at the same time, more susceptible to improved conditions of culture. Still, many are deterred from planting from a mistaken idea that they do not understand its culture, or that it requires much care to raise it.

There are, of course, sorts that are better adapted to extremes of temperature and climate than others, and there are some modes of cultivation that are better than others; but we have neither time nor space now to go into particulars. The special object of this present writing is to call attention to one of the most approved varieties now cultivated, though not of very recent origin, which bears the name of our present honored Vice President, Schuyler Colfax. This plump, round and delicious berry is faithfully delineated in the accompanying engraving. It fairly makes one's mouth water to look at the picture.

The Colfax Strawberry

Was first introduced at South Bend, Ind., about fifteen years ago, by Mr. Colfax, it being one of a number of seedling berries that had been presented to him by an amateur friend. The "Small Fruit Instructor," a pamphlet published by Messrs. Purdy & Johnston, at Palmyra, New York, from which we gather the facts here given with regard to this variety, says of it:

> "We have known it for twelve years, and must say that, for productiveness and hardiness of plant we have never seen its equal; and we are prepared at any time to pay $100 for 100 plants of any sort that will produce as much fruit from the same sized bed for as many years in succession as this sort, or for even one season. * * * The plant is purplish green, and extremely hardy. * * * It forms astonishing hills —fully double the size of the Green Prolific, the Agriculturist, or of any grown in the same specimen bed the past season—over thirty in all. The fruit is medium size, round, and very uniform, hanging in clusters that have been the astonishment of all who have seen it; color, very dark crimson; flavor, sub-acid, with a very large percentage of juice. Not sufficiently firm to carry to distant markets."

This berry does not seem to have been very generally known to the pomological world until quite recently, when its cultivation was undertaken by Messrs. Purdy & Johnston, at their nursery in Palmyra. They have recently named it as above, and introduced it to the world. In a circular now before us they say:

> "We have tried to trace its origin, but unsuccessfully. We, therefore, on account of his first introducing it, have named it the 'Colfax.' It is no new, untried 'mushroom' sort with us, and we can, therefore, speak of it understandingly. * * * We venture nothing in saying it is the most productive strawberry within our knowledge."

LARGE VS. SMALL FARMS.—One great trouble with large farms arises from the fact that farmers owning large tracts of land usually have all their means locked up in land, and, therefore, have no capital to farm with. In such cases we would say, "Sell one-third of your land for the means to properly work the balance with, and you will have just as much produce as before, have plenty of money, and keep out of debt." The farmer needs capital to carry on his business as much as the merchant; but as things now are in this State, it is rare that the farmer gets any bank accommodation until he gets his wheat into the storehouse, and then it comes second-hand, with increased rates, and storage and wastage added. Very few farmers in California have anything like the capital they could use to advantage.

Diversified Products.

We would call the attention of our readers to the following summary of facts, as indicative of the progress being made in the introduction of diversified products into the great agricultural industry of this State:

An experimental crop of Louisiana sugar cane will be planted the coming spring at Twitchell's Island, in the Sacramento river, near the junction of the San Joaquin. If its growth can be made practical, a sugar manufactory will be established there.

Parties in Solano county have raised, during the past season, large quantities of canary seed. From eight to twelve hundred pounds of this seed can be raised to the acre, and it brings from five to ten cents per pound in this market.

Other parties, also in that county, have raised about 50 tons of coriander seed, the yield of which is about one ton to the acre. It is extensively used in the manufacture of bitters, cordials, etc., and the price ranges from four to ten cents per pound.

We have already noticed the fact that parties in Monterey and San José counties have been experimenting in the culture of the sorghum or the Chinese sugar cane, with gratifying results.

Large quantities of the ramie plant will be raised in the neighborhood of San Francisco bay the coming season. Fifty thousand roots have been ordered from New Orleans, portions of which will be sold to parties who may desire to enter into this branch of culture. Arrangements have been made with an English house to take all that may be produced in this State.

The same parties who ordered the ramie roots from New Orleans have also ordered, from France, a large quantity of madder seed, which, we presume, it is their design to sell to such parties as are desirous to undertake its culture. They have also set out 20,000 cuttings of yellow osiers.

Some successful experiments in tobacco culture have been made the past season in San Diego county, which will no doubt be repeated on a larger scale next season. The tobacco crop of Indiana, the past season, was about 12,000 hogsheads. There is no reason why that culture should not succeed better here than there.

A Los Angeles gentleman has been experimenting with cotton the past season, and the result has convinced him that it may be successfully grown in that county, without irrigation. The bolls gathered were of good size, finely opened, and the staple pronounced "remarkably fine." We do not regard the experiments hitherto undertaken on this coast for the culture of cotton, and pronounced failures, as by any means conclusive that we may not yet be able to produce our own cotton in California.

The culture of flax might and ought to be largely increased in this State. So far, as we have been able to learn, it has been a universally profitable crop here (much more profitable than wheat), when the location was chosen with judgment. There is a good demand for the seed. The oil mill in this city has been obliged to import 250 tons the first year, more than half its entire supply. The castor oil bean should also be more generally cultivated. The culture of broom corn might also be profitably extended. The same might be said of chiccory. The gathering of wild mustard, or its cultivation as a special crop, might undoubtedly be made a profitable business. Probably one of the most profitable manufactures which might be undertaken in this State, that would properly come under an enumeration of this kind, is opium. We are not aware that the culture of the poppy has ever been attempted here. An interesting and most successful experiment has been made in Vermont, the particulars of which we will endeavor to give next week. What our State most needs is a diversified and improved system of agriculture, and a more general application of capital and intelligence to this branch of industry. When our energies are properly exercised in this direction, this State will grow and thrive as it has never yet done since the first ten years of the gold excitement.

Transplanting Trees—Good Advice.

Mr. W. F. Kelsey, of Kelsey's Nursery, in Oakland, makes the following sensible remarks in his descriptive catalogue, recently published:

It is universally admitted by experienced orchardists, that nursery trees grown without irrigation are better adapted to stand transplanting in our dry soils, and hot climate, than irrigated trees. Trees so cultivated are not forced to grow out of season; the wood and buds are well ripened, and the bark is fresh and healthy. They are not overgrown, are in better root, in stronger stock, and in more fully matured growth.

In the selection of trees, a good stocky tree, of stout and vigorous habit, with unimpaired constitution, of neither stunted nor of forced growth, young and healthy, should be chosen for orchard planting.

In the preparation of the soil, that which is deeply and thoroughly tilled is the best. Where the trees are to have little or no irrigation, the ground must be plowed deep, and kept very light by cultivation. Capillary attraction operates to bring the moisture from the subsoil to the surface. Could the moisture collected be retained in the soil, it would supply the plants during our long dry summers. A loose surface prevents the moisture beneath from soon escaping in the air. Allow no grain, grass or weeds to grow among them, as such plants exhaust the soil of moisture, to the damage, if not the death of the tree. And to further insure the tree against the drouth of summer, a few inches of litter or coarse manure, as a mulching, will be of great service. If the supply of moisture is very plentiful, vegetables may be cultivated in the orchard, but not otherwise.

In moving, handling, etc., care should be used so that it should be done without tearing, twisting or breaking the roots, and the roots should *never* be allowed to get dry. When moved to a distance, they should be carefully packed together, and bundled with straw, or some material that will exclude the sun and air from the roots and protect the tree from getting bruised. At all times avoid exposing the roots to the sun, dry air, frost and bruising. Keep covered and moist.

Before planting, all broken roots should have the ends smoothly trimmed with a sharp knife. If a tree should get badly dried, lay it down and bury it root and top for two or three days, or until it fills with sap, and the bark looks fresh. Then, when planted, the trunk should be protected from the sun and winds.

Every young tree, excepting evergreens, when first transplanted should have its branches cut back to within a few inches of the trunk. Enough buds should be left to make new branches, and supply the tree with leaves. It is also expedient to cut the tree back to the height at which the head is desired to form. A new and vigorous growth is preferable to old limbs in a transplanted tree. Fresh bark and rich foliage are certainly better than thin, scattering leaves and sun-burnt branches.

Leaves are the lungs, and must be healthy, or the tree will suffer. They are also a shade for the branches and trunk, keeping the bark fresh in summer. On a newly-transplanted tree the leaves are most likely to be strong and luxuriant when started quite close about the trunk, while if long, slender limbs are allowed to remain, the bark gets shriveled, and the leaves are sickly.

THE STANDISH STEAM PLOW.—An interesting communication, under the above head, will be found on another page of our present issue, from a well known civil engineer. It was received too late for our last issue. We bespeak for it the consideration which the importance of the subject deserves. We regard the success of the Standish steam plow as intimately connected with the agricultural prosperity of this State, and fully indorse the remarks of the writer with regard to its practicability. If California fails to render the necessary aid to this invention, the honor and chief profit of the enterprise will eventually be enjoyed by some other locality.

GIVE YOUR STOCK GOOD WATER.—Stagnant or foul water is injurious to all animals. It causes blood poisoning, and this leads to many febrile complaints, and is one of the great causes of abortion in cows and other animals.

Herdwick or Navarre Sheep for the Sierras.

BY PROFESSOR ROWLANDSON, F. G. S. L.

It is claimed that there exists in California not less than 40,000,000 acres of soil, suitable for arable cultivation. This would still leave a balance of 120,000,000, the possible employment of which merits some consideration. If we deduct one-third from the latter named figures for forests, naked rocks and snow-covered mountain tops, there will remain 80,000,000 acres susceptible of agricultural utilization. The question is, "How can this be most economically and rapidly accomplished?" My reply to this question is, that it can in no way be better done than by covering our elevated lands and steep declivities with the Herdwick or Navarre sheep. The identity of the two has been apparent to me since I perused the article in the SCIENTIFIC PRESS, describing the latter as having been introduced into Missouri, and at the same time noticing some of their prominent qualities. I have, since last noticing the subject, obtained additional and strongly corroborative proof of the correctness of this pre-formed theory of the origin of the Herdwicks.

A California Witness.

Knowing and being personally known to a considerable number of the French sheep butchers residing in this city, I have, since my attention has been re-drawn to the subject, taken advantage of this acquaintance, with the object of ascertaining whether any of these persons were acquainted with the indigenous sheep of the mountainous district around Navarre. Amongst others, I have conversed with M. Jean Bayle, who informed me that he is a native of the department of the Pyrennes, where he has lived until he came to America. M. Bayle, being to my personal knowledge a well-informed, observant and truthful person, it will be seen that it was fortunate that I met with him, so far as further elucidation of the origin of the Herdwicks is concerned. He describes the Pyrennian sheep as possessing long necks, "rimy" faces, and "rimy" and speckled legs, and active travelers. So active are they that in a country celebrated for the athlectic character of its natives, the possession of any extraordinary amount of this quality by any one is commonly locally described as being as *lishe* as a Herdwick. He concluded his observations, without any prompting, to the effect that when penned (that is, folded,) they will not feed, a quality also pertaining to the Herdwicks.

Respecting the anatomical peculiarity of possessing an additional rib as compared with the generality of sheep, M. Bayle could not afford any information, as he never had his attention drawn to the subject. If, on future examination, it is found that this extra rib is common to both Herdwick and Pyrennean sheep, the identity of the two races will be reduced to a certainty. In any event, however, this fact appears certain—that, identical or not, the Herdwick and Navarre breeds of sheep form the species of stock best adapted to the secondary and still greater inferior soils of our more elevated foothills and Sierras.

Possibilities of Sheep Raising in California.

Assuming 80,000,000 acres of our mountainous tracts to be available for rearing and feeding the breeds of sheep under notice, and making the large allowance of eight acres to each ewe, wether or buck, of two years and upwards, along with their due proportion of younger animals, the space named would amply suffice for feeding 10,000,000 grown animals, with their natural quota of yearlings and lambs, the annual value of which may be estimated as follows:

Sale of 2,500,000 full mouthed wethers and drafted ewes @ $3	$7,500,000
Sale of 1,500,000 lambs @ $1	1,500,000
Sale of 40,000,000 ℔s wool @ 12½c	5,000,000
Total	$14,000,000

From which deduct:

Wages and rations for 5,000 shepherds, assistants, etc., at $50 per month, or $600 per annum	$3,000,000	
Sundry other charges, say	500,000	
		$3,500,000
Net annual return		$10,500,000

This magnificent amount, be it reflected, is capable of absolute realization, proving, in the most remarkable manner, the truth of the old Spanish proverb, "That wherever the foot of the sheep treads, the land is turned into gold." No danger here arising from "rebellious ores" (which, however, is only another name for metallurgic ignorance), "caving in," being drowned, or petering out; for nature annually renews the verdant supply.

Briefly Summing Up.

Amongst other concomitant advantages may be mentioned these prominent ones, viz: The mutton would be in constant demand; as it would be the finest in the world, superior to Southdown, it would also be most convenient to the best markets—the mining districts. The wool of a quality suitable for blanketing and coarse clothing; adjacent to water power, that could economically manufacture it into the necessary fabrics, and also near to where these goods are chiefly in demand. The actual profits, however, would be more than those set down, when the land becomes fully stocked, as the amount of lambs that might be annually drafted would amount to more than the number above set forth.

The very limited area previously known to me, on which are domiciled the variety of sheep possessing in so eminent a degree the fitness for mountain pasturage, is one reason why I never urged this subject on the flock-masters or the owners of Scottish moorlands, seeing the difficulty that existed in producing a change of breed, within any reasonable period; for it is to be borne in remembrance that such lands are already occupied by another—the black-faced breed. As, however, I learn now, almost to a certainty, that any number of similar sheep can be procured from the Pyrennes, it is my intention to call the attention of the proprietors of Scotch and Welsh mountain sheep walks to the benefits that would accrue to them by energetically promoting the change of breed which I have indicated—a task which to them will not be so easy as to residents of the United States; because the latter have only to begin *de novo*. But in Britain they will also require to extirpate the pre-occupants.

The Pacific Railroad Company,

Possessing, as it does, such an immense area calculated for no other variety but sheep and goat husbandry, is particularly interested in this matter, and ought to vigorously promote the object recommended. To do so advantageously, however, in place of the allotment of alternate sections of 640 acres each, larger ones of our more elevated mountain land should be allowed—comprising territory sufficient to feed, say 8,000 sheep per section, and give occupation to four shepherds. In such an event private sheep marks ought to be recorded, the obliteration or falsification of which should be made a misdemeanor punishable by imprisonment.

The Growth of Tree-Trunks.

A paragraph has been round the scientific papers stating that a French naturalist has been measuring the tree-trunks in a forest, and found them all broader in the east-west than in the north-south direction; the cause of the unsymmetry being ascribed, not very obviously, to the rotation of the earth. Well, another French arborist has been similarly gauging the trees in the neighborhood of Toulouse, and he finds that the greatest swelling of their trunks is towards the east-south-east point of the compass. The explanation offered by this second investigator is more philosophical than that of his predecessor. He refers the deformation to the early morning sun, which warms the easterly parts of the tree more suddenly than the rest, stimulates the flow of the sap, which grows sluggish during the cool of the night, and draws up the nourishing moisture from the soil in greater abundance on the excited side than on those portions of the trunk where the warming is more gradual and its effects less active. Naturally, increased vitality on one side, be it animal or plant, results in developments, or larger growth of that side. There are traditions of some plants turning their flowers toward the sun; the truth may be that the sun only promotes the growth of those blossoms upon which it sheds its direct warmth. As Dulong said, every degree of the thermometer entails a law of nature.—*Every Saturday.*

MILK AND PORK.—According to the experiments made at the Michigan Agricultural College, the amount of milk consumed by pigs to produce one pound of increase was, for the first week, 7.20 lbs.; for the second week, 7.70 lbs.; for the third week, 12.52 lbs.; for the fourth week, 10.66 lbs.

Our High Mountain Lands.

The editor of the Lower Lake *Courier*, having made a trip through some of the more elevated portions of the mountain lands of Lake county, says:

Here is a large scope of country that the Government surveyors have not considered worth their while to survey; nor is it hardly worth the expense. It is not now, nor will it ever be, agricultural land. It will never pay to locate it in 160-acre lots, and pay Government prices for it. Still, were there some way that a person or persons could purchase a large tract in which many spots of pasturage would be inclosed, it would then be worth something to its owners as a stock range, and to the State in the way of assessments. As it now is, merely held in possession, of course no taxes are paid on it; the open spots of land are grazed by the stock that are driven from one to another, as the grass is eaten off them, and abandonment and "jumping" of claims held by possession is the occasion of frequent and bloody conflicts, and encourages a loose and lawless state of society. Were the General Government to donate all lands returned by the surveyors as "bad lands" to States in which they lay—for school purposes—and the States then to auction them off in 1,000-acre lots to the highest bidder, giving a title therefor, it would be a vast improvement on the present state of affairs.

This paragraph has an important bearing in connection with the communication of Prof. Rowlandson, in another column. We think the suggestions of the Professor and of the *Courier* eminently worthy of a careful consideration.

GROWERS' COMBINATION FOR THE SALE OF PRODUCE.—The Humboldt *Times* recommends that the farmers of that county should do as those of San Mateo have done—form a club for their mutual benefit and protection. It says that such a combination is necessary to prevent losses and exhorbitant commissions in the sale of potatoes and other produce in this city.

A POOR CROP requires nearly as much labor for cultivation and harvesting as a good one, while the profits of such a crop are annually eaten up in high wages; but a good crop leaves a handsome balance for profit. Viewing the situation, then, in whatever light we may, one fact is prominent—the necessities and advantages of improved farming.

AGRICULTURAL LECTURES.—Farmers in the vicinity of Centralia, Ill., have made arrangements to have a course of agricultural lectures delivered at that place during next month.

MECHANICAL PROGRESS.—Improvements in Agricultural Steam Engines; Compressed Air-Brake; Imitations of Damasked Steel; Steam Hammer. 51
Underground Railways. 68
SCIENTIFIC PROGRESS.—A Final Zoic Catastrophe; Dr. Livingstone; Polarization of the Corona; Another Oxygen Process; Molecules, etc. 51
FARMING AND GARDENING.—Cashmere Goats from the East, Improvement of Grain; The Strawberry; Farms; Diversified Products; Transplanting; The Growth of Tree Trunks; Herdwick or Navarre Sheep for the Sierras; Our High Mountain Lands; S. F. Market Rates, etc. 65
READING FOR THE HOUR.—The Lightning's Autograph—Ill; Small Feet in China; Hints and Recipes, etc. 60
S. F. Shareholders' Directory 53
MINING SUMMARY.—Items from various counties and districts in California, Arizona, Colorado, Idaho, Montana and Nevada. 42

Notices to Correspondents.

"L. C.," Bulliona, Alpine Co.—The crystals sent were of zincblende; for the test, see "Notes on Contributions to Our Cabinet."

"J. W. L."—If your ore is chromic iron, it should have a black to brownish black color, give a brown streak, be hard enough to scratch glass, opaque, brittle, and have a luster between that of metallic and that of non-metallic substances. Before the blowpipe, it should be infusible; but melted (with difficulty) with borax, it should give a fine green glass. The ore usually occurs in serpentine. It is valuable for the manufacture of chrome colors.

THE YOSEMITE VALLEY.—It is stated that Messrs. Hutchings and Lamon have gone to Washington, to try to get a confirmation of their claims to the Yosemite. It would seem to be the general opinion that these gentlemen have rights as *bona-fide* settlers, under the preëmption laws, but that the valley must rema in State property, the Legislature of California giving them a fair equivalent. What outsiders think, may be seen from the following paragraph from the Chicago *Tribune*:

> If Messrs. Hutchings and Lamon have any preëmption rights, Congress is not the place to enforce them. If they have none, Congress ought not to give them any. If they had a case which would probably result, through an action of law, in giving them the land which they claim, then we think that the offer made to them by the Commissioners of the Valley, of leases for ten years at a nominal rent, with an agreement to purchase their improvements, ought to satisfy them.

◆

A VERY NEAT PUBLICATION is the January number of the *Railroad Gazetteer*, which appears in an improved shape. It contains a large amount of gratuitous information of interest to travelers, to whom it is given without charge. The whole affair reflects great credit, with regard to both form and matter, on the enterprising publishers, Messrs. H. S. Crocker & Co., of Sacramento.

◆

THE DAILY CHRONICLE announces the commencement of its eleventh volume. DeYoung & Co. have conducted it during the past year with a great deal of spirit and activity; frequently issuing a double-sheet well stuffed with attractive reading. It is a cheap (five-cent) daily, and its success indicates that Californians appreciate their half dimes in the new order of things.

Drilling Machines.

There is a wide field for good drilling machines on our coast, and the need of them is deeply felt. The cost of hand-boring is such that explorations cannot be carried on to a sufficient extent in many cases where there is every favorable indication present to warrant such exploration, and the want of a large capital, consequently, is fatal to many operations which would add immensely to our wealth if they only could be prosecuted properly.

There seems to be a movement among the owners of drilling machines to try to introduce them into this State; but we fear that the proper method is not being taken. It will not do to first form a company with a large capital, sell to them the State right to the patent at an enormous price, and then throw all the responsibility as to the future success of the machine on their shoulders. The non-success, moreover, of one such case would have a damaging effect on all succeeding machines, however good they might be.

The only proper way to introduce any such invention is, to take contracts, and thereby practically demonstrate its worth. Statements of what has been done in some regions to us practically unknown, and bare assertions of what can be done, are not sufficient. Nor is it enough to select a certain spot, and invite the public to see a machine run a few moments; everything may be fair, but nobody is satisfied.

The value of any such machine is simply in the economy effected over present methods. However beautiful one may be constructed, or however nicely it may work in theory, if it cannot do more practical work in our mines, at a less expense than what we may have already, it has not the slightest real value for practical men; and the greater or less value of any machine corresponds to the greater or less amount saved by using it. Miners, therefore, naturally, and rightly, demand that it should be practically demonstrated, in their own particular cases, that they will be gainers by using any such apparatus. An invention which can thus satisfy them will be universally adopted; one which will not, does not deserve success.

We call, then, upon the inventors of such machines to commence by taking contracts and competing, in fact, with hand labor. There is no want of persons who are ready and desirous of giving such contracts, and every facility for a fair trial will be offered. In this way there will be no chance for suspicions of unfair play, nor will there be any difficulty in disposing of large numbers of any successful machine at reasonable prices. A successful trial will be advertised far and wide, and success once established, there will be no danger, in so broad a field as ours, with regard to the profits.

◆

LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEEL.—These wheels, used extensively in the East for a long time, it will be seen by an advertisement on the last page of this paper, are being adopted in many places on this coast. Leffel & Myers, of Portland, Oregon, are the manufacturers, and P. S. Sanderson, No. 112 California street, San Francisco, the general agent.

◆

GAS-LIGHT JOURNAL.—We welcome the number for Jan 3d,—which is, for some unaccountable reason, the first we have seen of this valuable journal for several weeks. We regret the loss of Prof. Wurtz's *Chemical Repertory* for so long a time. We always find something good in it.

◆

RAILROAD CONSTRUCTION. — The New York *Tribune* estimates that, in 1869, 7,845 miles of railroad were constructed, at a cost of about $300,000,000, which would be over 100 miles more than were built in any one year. The next largest number comes in 1856, when 3,643 miles were built.

Cheap Railroads.

The subject of building cheap railroads, in order to be able not only to extend them more generally throughout a thinly-settled country, but also to check the increase of huge monopolies, is attracting considerable attention at the present day. Could we have a system of roads cheaply and extensively constructed throughout the western part of our country, the beneficial results would be immense.

Saint-Pierre and Goudal System.

Among others who have given their attention to this subject, two French engineers—MM. Saint-Pierre and Gondal—have invented a railway which is interesting in its details, and for a description of which we are indebted to *La Propagation Industrielle*. This requires but one rail and an asphaltum road-way, and can be constructed at a very moderate expense. Moreover, it admits of quite heavy grades, and it is not always necessary to build a special embankment, as a common roadway can be used if moderately level.

The Rail.

The rail, shown on a large scale in Fig. 2, has the shape of an inverted V, and is fastened on wooden stringers. Its weight is about fifty pounds to the running yard. It rises about four inches above the surface of the ground. Where carriage roads cross the track, this rail is discontinued the proper distance, and is replaced by two "counter-rails," firmly fixed in the ground and about two inches high, which serve as guides to the running wheels of the locomotive, and prevent them from diverging to either side.

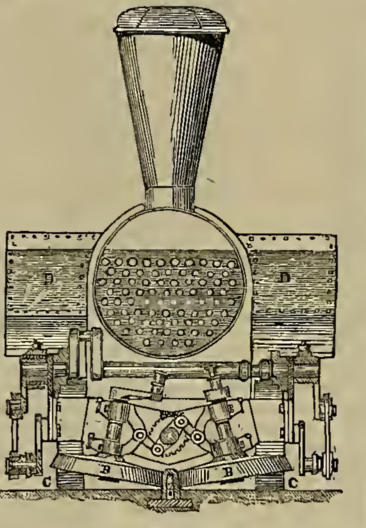

FIG. 1.—THE ENGINE.

One peculiar feature is, that it is proposed to lay a telegraph cable along the inside of the rail, as shown at A, Fig. 2, instead of having wires supported on posts, as is commonly done.

The Roadway.

On each side of the track, at equal distances from it, are laid two bands of compressed asphaltum, about ten inches wide and four inches thick, which rest on four-inch beds of beton. These are laid after the French manner of compressing pulverized asphaltum, by passing heated rollers over it (instead of melting the substance and running it into the required shape), and are placed about 3¼ feet apart, making the whole width of the road some five feet. On these bands or layers run the vertical driving-wheels of the locomotive.

The Locomotive

Is represented in section in Fig. 1. The distinguishing features which need mention here are, principally, the different sets of wheels and the apparatus for holding the water and fuel.

There are two sets of wheels: the running or vertical ones, C, C, which are worked similarly to those of the common locomotive driving-wheels, and those marked B, B. These latter are four in number, and have the inclination shown in the illustration. They are of the same size as the wheels C, C, and are worked at the same speed and by the same power. They press with a certain degree of force on the rails, and thus aid in propelling the locomotive, and at the same time keep it going in the right direction. By means of this additional power, the train can be run up the necessary inclines, and the wearing of the asphaltum ways by the slipping of the wheels, C, C, is reduced to a minimum.

On the front part of the locomotive, and on the wagons, are smaller wheels, placed in the same position as B, B, which serve to guide them, and prevent their getting off of the road. A vertical wheel before and one behind run on the rail, and take a part of the load off of the driving-wheel. The coal and water are carried in tanks, D, D, on each side of the boiler, thus rendering unnecessary the use of a tender. A cow-catcher removes sticks, stones, etc., from the asphaltum roadway.

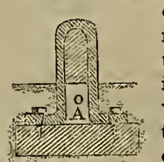

FIG. 2.

We have not space to give further details, and merely add the estimated expenses of constructing such a road.

Expenses of Construction.

It must be remembered that the estimates given are on a French basis, and that the price of labor in France makes things much cheaper than they would be in this country. The estimates are for each mile, calculated for a line twenty miles long, and are as follows:

Making and laying the rail complete	$3,366 per mile.
Making and laying the asphaltum ways.	1,868 per mile.
Rolling and stationary stock, comprising 3 stations, 3 water tanks, 4 locomotives, 6 passenger wagons, 12 freight wagons.	1,546 per mile.
Various	213 per mile.
Total	$6,993 per mile.

Say, then, the cost varies from $7,000 to $8,000 to the running mile for a line of the length of twenty miles, calculated for a railroad in good condition. This is merely a very general calculation, of course, as in a proposed line the number of bridges and other works which make up a very large item, cannot be generalized with accuracy.

◆

Notes on Contributions to Our Cabinet.*

We give the following examinations, as examples of how they are conducted, and as we often receive letters, asking how to determine a given mineral. The specimens examined were among those which happened to be sent to us. The first was examined by Mr. Henry G. Hanks, of San Francisco, whose interest in, and knowledge of, the minerals of this coast, are inferior to those of no other person:

1. Ilmenite (No. 453) from Georgetown, El Dorado Co.—Color, black; lustre, sub-metallic; streak, iron black; hardness, 5; sp. gravity, 4.6; powder, magnetic; fusible only on the thinnest edges; with microcosmic salt and with borax gives the reactions of oxide of iron; with microcosmic salt and tin gives the reaction of titanic acid; after fusion with bisulphate of potassa, the aqueous solution throws down a dense precipitate of titanic acid on being boiled.

2. Zincblende from Bulliona, Alpine Co. Outward characteristics: color, black and yellow; streak, dark brown to yellow; lustre, resinous and brilliant on a cleavage face; easily cleavable; hardness, 4; crystalline form, combinations principally of dodecahedrons. Blowpipe reactions: infusible; on charcoal with strong heat get zinc sublimate, which is yellow when hot, and white when cold; melted with soda, stains silver (sulphur); treated with protonitrate of cobalt gives the green color of zinc.

---

* Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., adds much to the value of such specimens.

◆

DR W. A. BAYLIS is preparing ground on the Coyote River, for planting twelve acres of mulberry trees.

Our Home Industries.

Glass-Making.

The manufacture of glass, besides being a very important industry, is also in some of its details one of the most interesting and beautiful of all processes. It demands, moreover, great skill and experience; and a large amount of brain has been put into even the most common of our bottles and glasses.

Its History on this Coast.

The enterprising firm of Baker & Cutting were the first to start works on this coast; but their attempt was not long continued on account of the great difficulty in getting good workmen, materials, etc. Some time after their trial, Dr. Geo. W. Post, in traveling about the country, thought that he saw sufficient inducements to warrant another experiment, and in 1862 he, with Messrs. Taylor, Cutting, Kohler and Turner, erected a small experimental furnace at North Beach. The initiatory attempts promised well; but the police authorities objecting to such a factory in that vicinity, they removed to the Potrero, raised their capital to $100,000, and in 1863 commenced running what are known as the Pacific Glass Works. In 1866, these works were leased to Messrs. Bennett & Co., who have kept them going up to the present time.

The San Francisco Glass Works.

These were put in operation in 1863 by Newman & Brenaan, and were located on Townsend street, between Third and Fourth. The list of articles manufactured was very large, including various kinds of white as well as black and green glass, and the quality was equal to that of imported ware. Forty men and boys were employed. The furnace contained eight large crucibles. The works, after running very successfully over three years, were destroyed by fire. But they are to be rebuilt at the corner of R street and Fifth avenue, South San Francisco, near the end of the second long bridge, and will be in operation in a few months under the efficient management of the former superintendent, Mr. C. Newman. All classes of druggists' and chemists' ware, lamp chimneys, funnels, demijohns, carboys, bottles of all descriptions, etc., are to be made. The manufacture of pressed ware, which includes glasses and goblets, is eventually to be introduced. The details of the manufacture are similar to those hereafter described at

The Pacific Glass Works.

This factory stands at the corner of Iowa and Mariposa streets, at the Potrero, not far from the Long Bridge. Mr. J. C. Bennett is the superintendent, and very kindly conducted us over the works, showing us the various details of this very interesting manufacture. The agent is Mr. John Taylor, 514 Washington street.

The Materials.

The sand for common glass comes from Oakland, some 40 tons being used monthly. For superior work, the finer and more costly Monterey sand is used. The lime comes from San José; the soda-ash (about 40,000 pounds used monthly) comes mostly from England. Arsenic is used to give brilliancy to the glass; black oxide of manganese (from Red Rock) to remove the green color of iron oxide and to give an amber tint; zaffre (a cobalt mixture), for a blue color; Hungarian black lead (plumbago) for the amber tinge; salt and saltpeter for fluxes. Some 100 to 115 tons of Sidney coal are used monthly in the furnace, and 10 cords of pine wood weekly in the annealing ovens. The fire-clay for the crucibles comes mostly from Germany, partly from England; the dressed rattan for the wicker-work around the demijohns from China.

Making the Crucibles

Is a very important part of the business, and requires great skill and care. The imported clay is freed from external impurities and burned (in part) thoroughly in an oven. Then two parts of burned and one part of raw clay are ground together in a mill, put into a box, moistened, and thoroughly worked from three to four weeks by daily turning and treading with the bare feet. It is then built up by hand in a mold to crucibles 33 inches high and 40 inches in diameter, the bottom being 4 and the sides 2½ to 3 inches thick. These stand in the drying room generally about six months, that they may acquire the requisite hardness and dryness. When needed, they are put into the "pot-arch," gradually and carefully heated during 36 hours, until they are red hot, and then carried on an iron carriage and deposited in the furnace.

Mixing the Materials.

In the mixing room the various materials are put on the floor and thoroughly mixed together. The sand is taken as a basis, and to this some 40 per cent. of soda-ash, 15 per cent. of lime, and the requisite amount of the other articles, together with broken bottles, are added. The mixing is done in the day-time, and at evening, when the blowers have finished work, the ingredients are put into the crucibles. Enough is added at various times to fill the pots with molten material, the melting occupying the whole of the night. In the morning the mass is as fluid almost as water. It is then allowed to cool and thicken a little, and just before the blowers commence work, is heated again to the proper consistency.

The Furnace

Is round, and contains seven crucibles and seven corresponding openings in the dome-like top. The one now in use—of the Greenhouse pattern—has lasted two years, an unusually long time, having been very carefully constructed. Six months is a good average time. The crucibles last about eight weeks. Around the furnace runs a raised platform, on which the blowers work, and at whose edge are fastened the molds, etc.

The Process of Blowing.

The blower takes a hollow steel pipe, some six feet long, and dipping one end into the liquid mass in the crucible, gently turns it until the requisite quantity adheres. Then quickly removing it, he rolls the mass on a flat stone, to shape it a little, and then plunging it into the mold, blows through the tube until the mold is filled with the hollow glass. Removing the bottle, whose body is now made, he places it in the door of the furnace, deftly breaks off the neck, which he has drawn out until it is very long and thin; with another iron tool runs a small quantity of melted glass around the neck, and shapes this with a small instrument. In much less time than it has taken to describe the process, the bottle is completed and placed in the annealing oven, where it takes three days to harden and anneal.

To each one or two of the blowers there is a boy to hand the tools, take them away, etc. The neatness and celerity with which each different bottle is formed, makes the process extremely interesting and instructive.

The Packing, Blacksmith Shop, Etc.

The bottles after being annealed (without which process they would be extremely brittle), are carried to the sorter, who, by holding them up to the light, immediately detects any flaw or imperfection, in which case the bottle is rejected and goes back to the mixing room. The sound bottles are carefully packed in cases for the market.

In the blacksmith shop are innumerable molds of every shape and size. Those wishing it, can have their bottles cast in special molds, with their name, trade mark, etc., on them, these being reproduced on the bottle.

Demijohns.

The making of demijohns is a speciality here, and all sizes are manufactured. After being blown, the article is carried to a lower room, where rattans, which have been soaked several days to make them more flexible, are woven around them in a peculiar fashion, which forms a strong protection. The superiority of this wicker-work is such, that a demijohn can be dropped from a height of several feet on to a hard floor without the least danger of breaking, as the superintendent practically proved.

Workmen.

When under full headway, there are employed 18 blowers with 21 boy assistants, 16 outside men in various capacities, and from 5 to 30 Chinamen to make the wicker-work for the demijohns. The blowers are paid by the piece. An experienced hand can turn out daily 75 to 80 soda-water bottles, 115 to 120 dozen mustard bottles, 50 to 70 dozen half-gallon jars, or 75 to 80 dozen ordinary black wine-bottles.

At the factory are made green and black bottles of all shades, shapes and sizes; demijohns and carboys of superior quality; telegraph insulators of a new pattern; side-walk and sky-lights, and other articles too numerous to mention. The value of the articles made amounts yearly in round numbers to $100,000, or from $8,000 to $13,000 per month.

Patents and Inventions.

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending January 11th.

Medicine or Liniment for Treating Nervous Diseases.—Joel F. Smith, Forest Hill, Cal.

Platform Attachment for Grain Separator.—John Whiteside, Salinas, Cal.

DESIGN.

Printers' Type.—Thomas M. Cash, San Francisco, Cal., assignor to Hsgar & Co., New York City.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than any other agency.

Pacific Coast Inventions for 1869.

It is a subject of general remark that California produces a larger number of valuable patents than any other portion of the United States with a similar number of inhabitants. The only reason that we can assign for this fact is, that we are an observing people.

Nearly all improvements and inventions have been brought about by employing some common and well known mechanical power or movement, or some manufacture as a means of producing or avoiding an effect analogous to that which originally impressed the inventor or discoverer. A subject, an idea, and then a principle, is the common process of inventing; and whether our California people are naturally more observing than the inhabitants of other portions of the country, or whether "necessity is the mother" of their efforts, we will not attempt to establish.

California presents a field for more varied pursuits than any other portion of our country of an equal area. This fact may, in a degree, account for the versatility of our inventions. Improvements in apparatus for working the precious metals are subjects of frequent patents, and we have had, during the past year, quite a number of valuable ideas patented in this line. No little stir was made at one time concerning an electric process employed by Messrs. Pioche & Nolf, of this city; but we believe that besides the patent obtained by them, only one other, that of Prof. A. F. W. Partz, of Oakland, has been issued. Chas. D. Smith, of Drytown, Cal., has patented a Revolving Sluice Concentrator, which promises to be a valuable aid in saving sulphurets, while various other patents have been obtained for improvements in mining apparatus, some promising well. We cannot refrain, in this connection, from alluding to a new crushing mill, patented by J. Harvey Day, of Walla Walla, W. T., which, although not yet practically tested, is expected to perform wonders in reducing our auriferous boulders.

In the agricultural line, we have a steam plow, patented by Linus Stewart, of this city, while in gang-plows, which seems to be a favorite hobby of our California inventors, a large number have been patented, and some have met with success. Besides these inventions, a large number of agricultural implements and tools have also been brought out.

We note for the year an unusual number of patents under the head of Navigation—both aerial and marine. Among the former, is Mr. Marriott's "Avitor," which, the inventor has proved, will so far accomplish the object he is seeking as to move through the air in obedience to its rudder. Mr. Marriott has shown in aerial navigation what Fulton did with his first steamboat—he has demonstrated that a body having a certain amount of buoyancy, and constructed upon correct principles for the purpose for which it is intended, can be driven through the air by propellers. Whether or not a practical success will be made, we wait to see. In marine navigation, we have several propellers, patented respectively by Adam Wingard, Simon B. Morey, A. C. Loud and C. T. Finlayson, each claimed as having decided advantages over the common paddle-wheel. Steam engines have been improved by several patents, and a method of preventing the destruction of boiler tubes in surface condensing engines, patented both in this country and England, by Geo. Hawxhurst, of Somersville, Cal., is meeting with decided success; being used, we believe, on most of the large steamships on this coast.

Hardly had the terror inspired by our last heavy earthquake been dissipated, when our inventors turned their attention to overcome or alleviate the effects of the next one. The first idea seemed to be the want of some registering or telegraphing apparatus, which would give timely warning of the approach of the earth-wave. This idea seems to have been abandoned; and we immediately have various patents on the construction of buildings in order to render them "earthquake proof;" amongst which, we name one by William H. Foyo, of this city; another by A. MoPherson, of Santa Cruz, both having decided points of merit. Mr. A. F. Cooper, of this city, has secured a patent on an elastic foundation for houses, which he claims will break the force of the shock before it reaches the structure; while various devices have been secured to prevent the falling of chimneys during the shock.

We can calculate, if we accept the plans of these gentlemen, that the next shock will meet with less encouragement than the last, in which case we would hope that its disgust will cause it to leave us alone thereafter.

The hook-and-eye machine, exhibited at the late Mechanics' Fair, was an invention of this year, and one of great merit, especially so as no machine for that purpose was ever patented in the United States before.

On sewing machines, we have quite a variety of patents. A great desire has been manifested by inventors to do away with the treadle motion or pedals for driving the machine, and applying some mechanical motor. Patents on various devices driven by spring power have been obtained, and one by Jacob Zuckeman, of this city, is, we believe, meeting with success in the East. An electric motor has also been invented in this city, which many think will finally take the place of both the spring and foot power.

The above are but a few of the more interesting and important patents which have been secured for inventors during the past year, by Dewey & Co., of the Scientific Press.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Platform Attachment for Grain Separators.—John Whiteside, Salinas, Cal.—Inventions for the better convenience of workmen on any machine always repay the addditional cost, when there is any, with a high rate of interest. All our experience tends to prove that the better the comfort of the laborer is attended to by the employer, the more profitable to all is his work. The object of this invention is to save time and money by attaching certain platforms to grain separators, enabling the persons handling the grain to work with greater ease and rapidity. In the hitherto usual manner of attending to these machines, boxes or trestles are used by the band-cutters to stand upon, which are very inconvenient. Instead of these, the inventor attaches platforms, one on each side of the feeder's platform, which are light, and can readily be detached from the separator when desired. By the use of these platform attachments much inconvenience and trouble are obviated, as the ground in front of the separator is left free and unobstructed, so that any loose grain can be removed at any time, whether the machine is at work or not, without interfering in the least with the table tenders.

Liniment for Nervous Diseases.—J. F. Smith, Forest Hill, Placer County, Cal. This is a compound for relieving pain and effecting a cure of nervous diseases, as neuralgia, rheumatism, nervous headache, paralysis, toothache, and others of a similar character, by external application. This compound is to be known as "Smith's Pain Eradicating Liniment."

Elevated and Underground Railways in New York.

The New York elevated railway, the principle of the construction of which was fully described in the Scientific Press of the 27th of March last, is now completed and in running order, from the foot of Greenwich street, near the Battery, to 39th street. It was the intention to have had a formal opening of the road for public travel on the first of January; but unexpected delays have compelled a postponement for another month.

The novel, aerial look of this road, has impressed some that there is danger from its apparently frail support; but engineering skill has fully provided against anything of that kind. The only remaining special fear that the cars may run off the track, has also been properly and surely guarded against, by engineering devices, by which, if they do leave the rail, they cannot fall from the frame-work, or in any way endanger the lives of the passengers. It is probable that the cars will run every three or five minutes. The speed on this road will be three or four times as great as that of the ordinary street cars. The road, thus far, has cost about $800,000. Should the experiment, to its present outward terminus, at the Hudson river depot, prove a success, it will be extended to the northern limits of the city, and another will also be built on the eastern side of the island.

An Underground Road.

Notwithstanding the promise of success for the elevated railway, the project for an underground railway, to start from near the City Hall, and to extend to the Central Park and beyond, is more talked of than ever. Ten or twelve millions of dollars will be required for the construction of such a road. Efforts are now being made to secure the necessary capital, and work will not be commenced until sufficient is subscribed to complete it with all possible dispatch, to Union Square. It is proposed that work shall be commenced simultaneously, at short intervals, all along the line. The excavation will be pushed forward day and night, most of the earth being hauled away during the night, while the streets are unobstructed. At least 1,000 carts will be at once set to work for this purpose. Cars will commence to run as soon as the road is completed to Union Square. If the road proves a success, it will be continued on to Central Park and beyond, with the ultimate purpose of passing under the Hudson river, and thus opening an uninterrupted railroad communication with the main land.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Advertising and Subscription Rates for the Scientific Press.

Subscriptions in Advance:—One year, $4; six months, $2.50; single copies, 10 cents; Monthly Series, $4.50 per annum; Quarterly Series (stiff paper binding) $5.

Lowest Rates for Advertising:

We shall adhere to the following rates (payable in gold coin) for advertising in the Scientific Press from this date:

	1 week.	*1 month.*	*3 months.*	*1 year.*
One sq. (10 lines agate)	$1 50	$ 3 00	$ 8 00	$ 32 00
Two squares	3 00	6 00	15 00	60 00
Three squares	4 50	9 00	20 00	76 00
One-fourth column	6 00	12 00	28 00	100 00
Half column	12 00	20 00	54 00	200 00
One column	20 00	40 00	100 00	400 00

RATES BY THE LINE.

Per line.—One week, 25 cents; one month, 80 cents; three months, $2; one year, $5.

Per line, ten lines or more.—One week, 20 cents; one month, 30 cents; three months, 80 cents; one year, $3.20.

Mining and Legal Advertisements will be inserted at special rates—less than one-half the cost of daily publication.

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form. We will otherwise assist advertisers in getting up their notices, when desired.

☞ All advertisements in the Press appear in both the ☞ the Monthly and Quarterly Series of the SCIEN- ☞ TIFIC PRESS, which (by special arrangement) are ☞ placed for free reading in the principal hotels, ☞ steamboat and steamship saloons, depots, and pub- ☞ lic reading rooms and libraries in San Francisco and ☞ Pacific States. Many volumes are also bound, thus ☞ affording permanent advertising.

The Press now receives the largest and best advertising patronage of any weekly paper west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—*our advertisers.* Better referees, or more reliable names, cannot be found in the advertising columns of any newspaper in the world.

Crucibles.

The Patent Plumbago Crucible Co.
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology. and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School." New Haven, Conn 13v6-1v18n

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, seven miles in length by four thousand feet in width, embracing five thousand and twenty acres.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of all mines discovered by the Tunnel.

4th—A royalty forever of two dollars on each and every ton of ore extracted from any part of the Comstock Lode, and

6th—The right of appropriation of all the water carried off through the Tunnel.

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, and be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to all parts of the mines, and through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make available many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt as to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, as has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwall, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata and Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots and mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very important revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Company two dollars per ton, forever, on every ton of ore extracted from any portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of this great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, and confidence in, all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coast,

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full-paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

Important to Californians.

The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods CHEAPLY, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

The plant has no enemies; mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $25 per hundred; 20 per cent. off to the trade. Address,

Metallurgy.

Metallurgical.

The undersigned respectfully announce to the public (especially to parties interested in mining) that they have opened an office at

No. 36 FREMONT STREET.

And WORKS at H. J. BOOTH & CO'S FOUNDRY, northeast corner First and Mission streets, San Francisco, where Ores in small or large quantities of all kinds can be worked by Pan Amalgamation, Chlorination or Smelting, and all kinds of Assays and Analyses made. We will also sample any Ores entrusted to our care; and in all cases returns made in the shortest time possible. We will give consultations on the best methods of successfully working Sulphurets or Refractory Ore.

Drawings Furnished for Quartz Mills, Smelting and Chlorination Furnaces.

By having had long practical experience in working Gold, Silver, Copper and Lead Ores, we hope thereby to get a share of the patronage of the mining public. ☞ Mines Examined and Reports made.

507 MECHANICAL MOVEMENTS.

PUBLISHED BY
DEWEY & CO.

LIST OF CONTENTS.

Æolipile.
Balance, Compensation: Barometer; Blower, Fan; Brake, Friction.
Cams; Capstans; Centrolinead; Clutches; Chasers; Clamps, bench and screw; Cock, four-way; Column, oscillating; Compasses, proportion; Counters of revolutions; Coupling, union; Crank—substitute for the, variable; Cranks, bell and compound; Cyclograph.
Differential Movements; Drag-link; Drill—Fiddle and Persian; Drills, Cramp; Drop; Drum and Rope; Driver, Pile; Dynamometers.
Eccentrics; Ejectors, Bilge; Ellipsograph, Engine, Disk; Engines—Rotary, Steam, Valve Gear for; Epicyclic Trains; Escapements.
Fountain, Hero's: Fusees.
Gasometers; Gauge, Bisecting; Gauges, Pressure; Gear, Steering; Gearing—Bevel, Brush, Capstan, Conical, Crown, Eccentric, Elliptical, Face, Friction, Internal, Irregular, Multiple, Mutilated, Scroll, Sector, Spur, Step, Stud, Sun and Planet; Gearing—Variable, Worm; Governors; Guides; Gyroscope.
Hammers—Atmospheric, Bell, Compressed Air, Trip, Steam; Helicograph; Hook—Boat-detaching, Releasing; Hooks, Centrifugal Check; Hyperbolas, Instrument for Drawing.
Intermittent Movements.
Jack—Hydrostatic, Lifting; Joint—Ball and Socket, Bayonet, Universal.
Ladder—Folding, Self-Adjusting; Lazy-tongs; Level, Self-recording; Lever—Bell-crank or Elbow, Knee; Lewis; Link. Detachable Chain.
Machine—Bohnenberger's, Drilling, Polishing, Punching, Warp-dressing; Main, Flexible Water; Maintaining Power; Meter—Gas (wet and dry), Water; Mill—Barker's, Crushing, Tread, Wind; Miscellaneous Movements; Motion—Alternating Traverse, Rocking, Self-reversing, Shuttle; Motions—Feed, Link, Parallel, Pump, Traverse, Variable Traverse.
Pantograph; Parabolas, Instrument for Drawing; Paradox, Mechanical; Pendulum, Conical; Pendulums, Compensation; Pinion—Lantern, Mutilated, Slotted, Two-toothed; Power, Horse; Presses, Hydrostatic; Propeller, Screw; Pulley—Expanding, Friction: Pulleys—Anti-friction Bearing for, Chain; Pump—Air, Balance, Bellows, Chain, Diaphragm, Steam-siphon; Pumps—Double-acting, Force, Lift, Rotary; Punching Machine.
Rack—Mangle, Mutilated; Racks and Pinions; Ram, Montgolfier's Water; Ratchets and Pawls: Regulator—Gas, Watch, Reversing Motion, Self; Revolver; Rollers, Oblique; Rolls—Anti-friction, Drawing, Feed; Rulers, Parallel.
Saw—Endless Band, Gig, Pendulum; Screw, Archimedes, Differential, Double Reversed, Micrometer; Screws—Endless, Right-and-left Hand; Sectors; See-saw; Shears; Stamps; Stand, Mirror; Stop—for Hoisting Apparatus, for Lantern Wheels, for Ratchet Wheels, for Spur Gear; Stops for Winding Watches.
Test, Friction; Throttle, Spinning; Toggle-joint; Tongs, Lifting; Trap, Steam: Treadles.
Water, Machines for Raising: Weir, Self-acting; Wheel Cam, Lantern, Persian, Pin, Rag, Sprocket, Steering, Waved; Wheels—Crown, Mangle, Paddle, Water; Windlass—Chinese, Friction; Windmills; Wipers.

This book is bound in cloth, and embraces 122 pages. The illustrations are plain, and each figure is clearly described on the page opposite to it. It is a low-priced book for its kind, and there are few persons who have to do with machinery, or are interested in understanding the science and principles of motion, who will not be benefitted and satisfied by its purchase.

A liberal discount made to the trade. Single copies, $1—sent postage free. Address orders,

DEWEY & CO.,
Patent Agents, San Francisco.

Reading for the Hour.

When we were in Colorado last summer, we were told a very characteristic story of Governor Gilpin. The Governor once took a party of gentlemen out to see some of his estates, which he was rather anxious to dispose of. At one place, rather uninviting to the eye—in fact, rather similar to the surroundings of San Francisco—he proceeded to point out the advantages of the location in his own peculiar way. "See there," he said, with an imposing sweep of the arm; "in a few years these hills will be covered with the purple clusters of the productive vine." "But, Governor," remarked one of the party, who was rather inclined to murmur at the barren prospect, "what will you do with all that sand?" "That sand?" replied the Gilpin; "that sand? With that sand we shall make the bottles to bottle up the wine." How the Governor might have proceeded to make those bottles, the reader may learn from our column on "Home Industries."

Gentlemanly Conduct.—It is getting to be a fashion now-a-days among those who lay great stress on being considered "gentlemen" (and who are obliged to proclaim the fact that they are such, that people may know it) to flog any person smaller than they are, in return for any real or fancied insult. A telegram from Virginia City lately announced, that the superintendent of a mine there horse-whipped Mr. Wiegand, editor of the *Peoples' Tribune*, on account of articles published in the paper which reflected on him. This seems to show that the articles are true; at least, that is what we must think, as no defense is made. The superintendent by his action has put himself on a level with the common rough, who knows no other than the knock-down argument—so far as the telegraph report shows.

John Smith, or Jim Smith, or Joe, or Billy, or some other Smith, in a discussion before the Board of Supervisors the other day, mildly intimated to a limb of the law that a certain statement made by such limb, if repeated when not under the protection of the Board, might result in something dreadful. The limb disclaimed any intention to repeat, and hence, we fear the local papers will lose a sensational item. [N. B.—Two other gentlemen did commence outside an interchange of compliments; but, unfortunately, a policeman was at hand, and no damage resulted.]

The Finest Country in the World.—Every day we are hearing of this place. Yesterday it was Nevada, day before yesterday, Montana; to-day, according to Gov. Safford, who has written to the New York *Sun* a long letter on the subject, it is Arizona. Here the climate is the most delightful, the soil the finest, the mines the richest, of any place on the coast. If any one of our readers thinks he does not know enough about that Territory, he can learn a great many *new* facts by reading the letter.

Patents.—We notice a number of patents issued to Californians in the Scientific Press every week, but none as yet is announced to Stanford & Co., for making telescopes out of railroad cars.—*Yreka Union.*

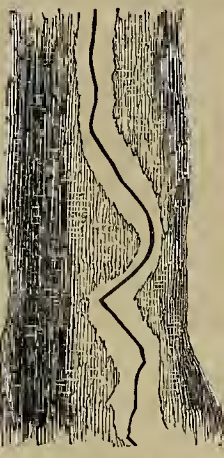
True, but if you will wait awhile you will probably hear of a patent having been secured through this office for an invention to *prevent* making telescopes out of railroad cars.

Modesty.—There is a man who thinks so poorly of himself, that he has written to the Board of Supervisors of this city, stating that he is willing to accept any good paying office at their disposal, from Chief Justice up (or down) to any other place. Give him a large contract to remove himself from the State.

The Lightning's Autograph.

On the 10th of September last year, an elm tree near Acton, Middlesex county, England, was struck by lightning, which left its mark along the trunk in a remarkable manner. Mr. H. J. Slack wrote to the London *Student* an account, from which we take the following:

The tree is about sixty or seventy feet high, and fifteen in girth, and stands, in the neighborhood of others, about forty yards from a house, which, on a steep hill, is a conspicuous object for many miles around. The groove cut by the lightning was not burned at the edges, or noticeably ragged. It was such as might have been made with a rather blunt square-edged chisel driven through the inner bark and descending a little into the sap-wood. It was about three-fourths of an inch wide, and one-fouth to one-half an inch deep, not reckoning the thickness of the displaced bark. It was traced from the ground to a height of about forty feet, and then lost amid ivy and branches. The bark was stripped off to an average breadth of about nine inches.



The Lightning's Track.

That the tree did not suffer greater injury may be ascribed to the heavy rain falling at the time, and to the good conducting powers of its abundant sap. In some places in and near the groove was noticed a slight growth of blue mould; the sap globules killed by the stroke having formed a fit medium to promote its development. The tree did not seem any worse for its accident, but it may possible suffer next year.

Those who are familiar with electrical experiments, must have noticed how often a long strong spark from a prime conductor of a frictional machine takes the zig-zag form. The first impression of those who saw the groove was, that the electric spark had made an exact imitation of its own zig-zag course through the air; and it may not be inaptly termed the lightning's autograph.

The most wretched country in the world, is, according to a correspondent of the New York *Tribune*, Egypt, at least in some respects and for some people. This is what he says:

In Egypt I saw for the first time a misery among the people that I could not endure. Heaven knows there is enough of it in Europe. A man need not leave London to find it; nor can he escape it in any city or country. I had seen Ireland; you know what that is. I have seen French villages, where men and women work sixteen hours on two meals of boiled greens; I had spent three months in Spain, the most wretched country in Europe, and counted one afternoon in the main street of Madrid, half a mile long, a hundred and forty-seven horrible beggars. But in Egypt it is obtrusive and oppressive, and at last intolerable. Till you have seen Egypt you have no conception of what poverty is—the poverty which weighs not on individuals as a consequence of idleness or misfortune or want of work, but the poverty which is the heritage of a whole race of patient men and women.

An Honorable Challenge.—M. P. Shannon, of Knight's Landing, challenges any boot maker in Yolo county to make a boot with him, on a wager of from $100 to $500; the wager to be given to the poor of the county.

Small Feet in China.

In China, long nails and small feet convey the idea of gentility and exemption from labor. But on the small size of the foot special stress is laid. It is only the most abject poverty or the direst necessity, which can lay an interdict on this essential of all female beauty. The richer the family, the earlier in life is the compression commenced. The strength of this fashion may be judged of from the very poorest striving to conform to it. Fashion leads mothers not to neglect this part of the education of their daughters, however careless in other matters. Few girls are taught to read, almost all have their feet bound. Fashion must always prevail over conveniences. Women ought never to appear in public; in state affairs they neither assist by their counsel, nor disturb by their ambition; and thus, to make the maxim more observed, they are taught that small feet constitute beauty, and the mothers first care, therefore, is to make her daughter fashionable, by making her a cripple.

Different Fashions.

The ladies in the south of China desire a three-inch foot. The Tartar women, on the other hand, do not wear the small shoes, but shoes with a large square piece of wood in the middle of the sole. These appear very inconvenient; but in wet weather or muddy streets, they raise the finely embroidered satin slippers above danger. In Pekin the Tartar element is so strong that small feet are less frequently seen than in the south. A milder form of compression, especially among the country people, exists; the four toes being bound under the foot without changing the direction of the heel very much.

The Emperor's wives and concubines must belong to the large-footed class; women of no other class are permitted to enter the palace; and some have said, with what degree of truth I know not, that a small-footed women entering the palace would be put to death immediately. The Chinese generally choose a small-footed woman for their first, or principal wife; and they add to this, by purchase or otherwise, a large-footed concubine; and, *vice versa*, a Mantchu with a large-footed wife, if of sufficient means to maintain more, adds the desired number of small-footed secondary wives to his stock.

How the Foot is Compressed.

The fashionable size is about three inches, but oftener five, and sometimes seven. The size depends upon the time when the compression is begun, and the regularity and tightness with which it is maintained. The bandages are never left off; for, after the standard size has been obtained, they are still retained to keep the shape and give strength to the foot. Without them, walking would be impossible; the unbound and unsupported foot is too weak to support the super-incumbent weight. The feet are never incased in iron shoes, as some have thought. Simple bandages are all that are employed, and are so applied across the foot as to carry the second, third and fourth toes, and especially the fifth toe, quite under the foot, and so obtain the least possible breadth; and by one or two turns of a figure-of-8 bandage, the foot is shortened, the heel is brought close to the ball of the big toe, and instead of forming an angle with the leg bones, it looks more like a continuation of them.

The Effect.

The bones of the instep are pushed out of place, and made to bulge, thus giving a great prominence, and an arched crescent form to that part. The three points upon which the foot rests are the heel in its new position, the ball of the great toe, and the fourth and fifth toes—their upper surface having now become part of the sole. The foot and leg become greatly atrophied, and the skin shriveled. The leg tapers from the thigh-joint to the foot, in the form of a cone, without the usual feminine risings and depressions, owing to the undeveloped calf; and that again is caused chiefly by want of exercise and proper motion to call these muscles into action.

The knee and ankle joints do not bend; all movement is from the thigh joint; the gait is mincing, with the arms slinging from side to side, and the body never straight or steady. They walk or stand, one might say, on their heels; and yet, from the nature of the shoe, with heel one or two inches higher than the toes, they may be said to walk on their toes.—*Chinese Recorder.*

Jupiter's Belts, according to astronomers, are changing. Some one suggests they are being handed over to Mars.

Hints and Recipes.

Butter and Flour.—In a family of ten persons, including two or three children, a barrel of flour lasts about thirty-six days. The same family consumes an average of one pound of butter per day, including that used in cooking. The average retail price here, for such articles, has been for some time past, about $12 per barrel for flour, and 60 cents per pound for butter. (Butter is a little cheaper just now.) According to these figures, it takes $21.60 worth of butter to use up $12 worth of flour—or an excess of $9.60. Few persons, we presume, have ever thought how much more it costs to keep a family in butter than it does to purchase their flour; yet we in California send twice as much flour abroad as we consume at home, and import more than half our butter. A more short-sighted policy can hardly be conceived of.

The Best Noon Mark is a pole so set that the shadow will fall at noon exactly in the middle of a walk, upon a row of small white stones, perhaps. It also offers another means of telling when it is noon, by the *shortness* of the shadow; for it is shortest when the sun is highest, and he is highest when he passes the meridian—which is noon.

Poisoned by Wool.—A lady in Marion county, Ky., was recently poisoned by the grease upon some wool she was spinning getting into a fresh cut upon one of her fingers. The hand and arm soon became badly inflamed, and erysipelas finally set in—of which she died in a few days. It is always dangerous to allow any thing which may be especially liable to carry poison, to come in contact with a flesh wound.

The Best way to Clean Paint, according to the *Coachmaker's Journal*, is to dip a slightly moistened flannel in whiting and apply the same to the paint in the same manner as for cleaning glass. After which, wash with clean warm water and rub dry with soft chamois skin. No soap is used. Paint thus cleaned looks much better than when cleaned with soap, and even the most delicate colors are uninjured. It does not require half the time and labor as when soap is used.

To Make Potato Yeast.—Boil one pint of hops in two quarts of water, strain the water from the hops, grate five good-sized potatoes, put into a kettle, add one cup of sugar, one tablespoonful of salt, one of ginger, boil ten minutes, add more water if too thick. Strain through a colander, cool, add yeast (to rise), bottle. It will keep a number of weeks.

No Longer Peculiarly American.—The custom of "dropping" a man can no longer be claimed to be peculiarly American when adopted by a foreign prince. On June 10th, two seconds of the editor of the *Marseillaise*, of Paris, called on Prince Pierre Bonapart, to arrange the details of an intended match between the Prince and the editor. An altercation took place, when the Prince seized his revolver and fired twice, killing instantly one of his visitors. The custom having received sanction from so high a source, will, we expect, become quite general.

Beautiful.—A child, speaking of his home to a friend, was asked: "Where is your home?" Looking with loving eyes at his mother, he replied: "Where mother is." What a beautiful tribute from a dutiful child to a faithful mother.

Down on the Clergy.—A German tailor has just been tried at Berlin for attempting to shoot a clergyman in a church during the services. The man desired to do some famous thing, and so performed this act.

The Washington *National Intelligencer* nominated Salmon P. Chase for President, and Robert E. Lee for Vice President for 1872, and then, totally used up by the exertion, collapsed, and ceased to exist.

Volunteer Compliments.

From an endless series of appreciative testimonials and frank acknowledgements, we give the following:

SUISUN CITY, Cal., June 26, 1869.

MESSRS. DEWEY & CO:—This is the third time you have presented me with Letters Patent within twelve months. Gentlemen, you have done all I have asked of you—you have been honest; you are men that an inventor can rely upon for doing business for him, and he need not fear of being swindled or wronged in any way. I would give you business to do in your various departments in preference to any one else. Many thanks to you for your success. You have obtained valuable patents for me, and I appreciate your kindness, your honesty, ability and success. Yours, RICHARD KNOTT.

"TIDAL WAVE" OFFICE, SILVER CITY, }
IDAHO TERRITORY, July 27th, 1869. }

MESSRS. DEWEY & CO.—GENTLEMEN:—Allow me to express my high appreciation of the ability and business management of the Mining and Scientific Press Patent Agency, and to say that our business relations have been marked with the utmost promptitude upon your part and with entire satisfaction upon mine.

Yours, etc., JNO. S. BUTLER.

SAN FRANCISCO, May 5, 1869.—MESSRS. DEWEY & CO. Gentlemen:—Allow me to express to you many thanks for services rendered me in procuring my patent, which has just come to hand. I would also say that your work has been faithfully done, and your advice and representations have in all cases been honest and truthful.

Respectfully, GEO. INWOOD.

SAN FRANCISCO, April 19, 1859.

MESSRS. DEWEY & CO., Patent Agents.—*Gentlemen:*—Allow me herewith to tender you my sincere thanks for the efficient assistance you have rendered me in securing my patent, and other papers, as well as the promptness and energy displayed by you in our business transactions. Very respectfully yours, C. E. JAYCOX.

GRASS VALLEY, Dec. 2, 1868—*Messrs. Dewey & Co:*—Having received the patent for Symons & Co's Tossing and Refining Concentrator, through your Agency, we return our sincere thanks to you for your unrivalled success. Yours, respectfully, SYMONS & HARRY.

MAYFIELD, Cal., June 26, 1869.

DEWEY & CO., *Patent Solicitors, San Francisco*—Gentlemen:—In acknowledging the receipt of my Letters Patent, allow me to express my thanks for the skillful and trustworthy manner in which you have conducted my business before the Department at Washington. I am perfectly satisfied with the high degree of ability and integrity displayed in the management of my case, and I know of no similar agency in which I could place corresponding trust. Yours truly, J. M. JOHNSON.

STOCKTON, April 8th, 1869.

MESSRS. DEWEY & CO.:—Your favor of the 6th inst., accompanying patent for improvement in horse shoes, is received. I beg you will accept the earnest assurance of my gratitude for your kind assistance and valuable services. Very truly yours, W. R. WATSON.

SOMERSVILLE, CAL., August 25th, 186.

MESSRS. DEWEY & CO.—Dear Sirs: Allow me to return you my thanks for the very able manner in which you have conducted the business entrusted to your care. You will please forward the document (British Patent) by Bamber's Express to this place. Yours, respectfully,

GEO. HAWXHURST.

JAMESTOWN, Cal., July 6th, 1869.

MESSRS. DEWEY & CO.—GENTLEMEN:—The Patent for our Ore Washer and Concentrator was duly received by express. We return you our thanks for the promptness and successful manner which have attended your efforts in our behalf. Yours, WM. G. HESLEP.

SANTA CRUZ, December 30, 1869.

MESSRS. DEWEY & CO —*Gentlemen:*—Yours of the 24th December, inclosing my patent for construction of earthquake-proof wall, was duly received last night. I am highly pleased with the way in which the business has been done. The ability which carried it through, and the scrupulous care bestowed on its preparation, are above praise; and I will gladly intrust to your hands any further business I may have to do, which will soon take place on a very useful and important invention.

Very truly yours, A. MCPHERSON.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

NEVADA CITY, Nov. 3d, 1868.

MESSRS. DEWEY & CO.—Gentlemen:—Your favor of the 30th ult., is just received, informing me of the successfull prosecution of my application for a patent on my "Hair Cutting Shears." Please accept my sincere thanks for the speedy and successful manner in which you have conducted the case, and believe me, as ever,

Very truly yours, LEE D. CRAIG.

SCIENTIFIC PRESS.—This paper, indispensable to every mine and mining man on the Pacific coast, closes volume nineteen with the number now before us. The proprietors have reduced the price to four dollars per year, and say: "Profited by the experience of the past, and encouraged with liberal patronage, we shall add improvements which will render the next volume of the Press much superior to its former issues.—*Alpine Miner.*

SCIENTIFIC PRESS.—The Mining and Scientific Press, which has been a faithful exponent of the scientific, mechanical and industrial interests of our western coast, entered upon its twentieth volume on the first of January, and at the same time adopted the shorter and equally comprehensive title of Scientific Press. This journal has, for some time past, maintained a department specially devoted to agricultural matters, and has filled it with useful and interesting information.—*Contra Costa Gazette, Jan.*, 1870.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24v18-4w

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

10v18 6m B. F. HOWLAND.

BLOCK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 24v19-3m

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

RETURNED.—Dr. J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

"SEE, the conquering hero comes," with a pair of C. Muller's spectacles a-stride his nose. He got them at 205 Montgomery street. *

New Mining Notices.

Arctic Silver Mining Company.—Location

of Works: Cortez, Lander County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the seventeenth day of December, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
B W Hathaway	unissued	75	$225 00
Louis Dionne	unissued	5	15 00
A H Emanuel	unissued	2	6 00
I E Brockow	unissued	3	9 00
A D Meacham	unissued	25	75 00
Robt Hawxhurst	unissued	25	75 00
J P Moore	unissued	50	150 00
Emma E Snyder	unissued	5	15 00
J D Wilson	unissued	10	30 00

An in accordance with law, and an order of the Board of Trustees, made on the 17th day of December, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the eighth day of February, 1870, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office, 426 Montgomery street, San Francisco. ja22

Cassell Silver Mining Company.—Location

of Works: Cortez, Lander County, Nevada.

NOTICE.—There are delinquent upon the followed described stock, on account of assessment levied on the seventeenth day of December, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
B W Hathaway	unissued	75	$225 00
Robt Hawxhurst	unissued	10	30 00
A D Meacham	unissued	45	135 00
R Yaeger	unissued	6	18 00
Emma E Snyder	unissued	5	15 00
S L Goulding	unissued	5	15 00

And in accordance with law, and an order of the Board of Trustees, made on the seventeenth day of December, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the eighth day of February, 1870, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office 426 Montgomery street, San Francisco. ja22

Idaho Silver Mining Company.—Location

of Works: Cortez, Lander County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the seventeenth day of December, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

Mining Notices--Continued.

Alleghany Consolidated Gold Mining Company, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of December, 1869, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the seventh day of February, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street, San Francisco. jan8

Glenwood Mill and Mining Company.—

Location of Works: Greenwood, El Dorado County, California.

NOTICE.—There are delinquent on the following described stock, on account of assessment levied on the seventh day of December, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Lucy Janeson	24	70	$14 00
Michael McCarthy	15	70	14 00
J H Sayre	36	140	28 00
J H Wood	31	67	13 40
J H Wood	not issued	105	21 00
J J Miller	balance due 34	220	30 75

And in accordance with law and an order of the Board of Trustees, made on the seventh day of December, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, No. 318 California street, San Francisco, Cal., on Tuesday, the first day of February, 1870 at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

O. D. SQUIRE, Secretary.

Office, 418 California street, San Francisco. jan15

Imperial Mining Company.—Location of Works: White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of January, 1870, an assessment of twenty-five (25) cents per share was levied upon the capital stock of said Company, payable within thirty days, in United States gold and silver coin, to the Secretary, No. 319 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the tenth day of February, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eight day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. E. MOODY, Secretary.

Office, 319 California street, San Francisco. jan15

Latawana Mining Company.---Location: Hamilton City, White Pine, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the twenty-second day of December, 1869, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at 614 Merchant street, Room 26, or at 526 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the nineteenth day of February, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. MARTINON, Secretary.

Office, 614 Merchant street, Room 26, or 526 California street, San Francisco. dec18

Pinto Mining Company.—Location of Works: Silverado, Pinto District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of January, 1870, an assessment of fifteen (15) cents per share was levied upon the capital stock of said Company, payable on the fifth day of January, 1870, in United States gold coin, to the Secretary, No. 426 Montgomery street, San Francisco, Cal., or to HOMER S. KING, ESQ., Agent of Wells, Fargo & Co., Hamilton, Nevada.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of February, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventh day of March, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. B. ARROWSMITH, Secretary.

Office, 426 Montgomery street, San Francisco. jan8

New Advertisements.

RICE'S PATENT
SELF-ADJUSTING
UNIFORM STAMP LIFT.

A Model of this valuable invention can be seen at the MINERS' FOUNDRY CO-OPERATIVE, 235 to 245 First street, San Francisco. 4v20-1m

Illustrate your Inventions

IN THE SCIENTIFIC PRESS,

An illustrated journal of Mining, Farming, Mechanic Arts and Industries on the Pacific Coast. It costs no more for a superior engraving by our experienced artists than is usually charged for a less perfect picture. If you wish to introduce a new invention properly before the public, the first steps in so doing are important ones. A full description and correct representation in the PRESS will go further and prove more quickly effective than any other means.

The fact that an illustration is admitted into our columns, guarantees the invention important consideration in the minds of thousands of the most intelligent readers—at home and abroad—who would not notice it so favorably or so thoroughly, if at all, when presented through an unreliable medium or indifferent source.

The model of an invention sent to us is sufficient for making a good engraving, Sometimes a photographic view is sufficient; but it is always best accompanied with drawings or a copy of the patent. A first-class illustration has proved to be one of the best and cheapest means of obtaining purchasers for a good machine or a valuable patent.

Cuts ordered for illustration are the property of the inventor who pays for them, and can generally be used for circulars, pamphlets, books, or other newspapers. The engravings to be seen in each issue of the SCIENTIFIC PRESS are a fair sample of the work of the artists who can always be found in our office.

One Per Cent. per Month

Allowed on Six Months' Deposits by the CALIFORNIA BUILDING, LOAN AND SAVINGS BANK, California street, one door from Sansome.

August 2, 1869. THOMAS MOONEY, President. 6v19-1m

THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & CO., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

The Aerial Steam Navigation Company.

At a meeting of the stockholders of this company, December 17th, 1869, Messrs. Eugene Sullivan, Thomas N. Cazneau, Henry F. Williams and Simon L. Jones were appointed a committee to receive subscriptions for one thousand shares (one-tenth of the capital stock of the company) at the rate of ten dollars per share of the par value of one hundred dollars, said shares to be *unassessable.* The funds thus raised are to be devoted exclusively to the construction of the first aerial steam carriage, and to be deposited in the Bank of British Columbia, to be disbursed upon requisition of Mr George K. Gluyas, Engineer of Construction. The working, drawings, etc, can be seen at the office of Gen Thomas N. Cazneau, No. 321 California street, where subscriptions will be received. No invention for navigating the air has before received such positive indorsements from engineers of reputation, or so liberal encouragement from prominent capitalists' as Marriott's Avitor, which now seems sure of being thoroughly tested on a large scale. 2v20-my

Advertise Rightly and You will Surely Profit by it.

THE SCIENTIFIC PRESS is the best and cheapest advertising medium in the Pacific States

For advertising Mining and Farming Inventions, Machinery and Implements, Tools for Workshops, and all Industrial Pursuits on the Coast, and in fact, all matters which advertisers wish to have known to the most intelligent and industrial classes throughout this Coast.

The Scientific Press is printed in superior style on fine paper, and great care is taken to display advertisements conspicuously and in good taste.

A large edition of the Press is bound in Monthly Parts (pamphlet form) and also a large edition in Quarterly Series (stiff binding); which are furnished to hotels, libraries, reading rooms, ferry boats, bay, river and ocean steamers, R. R. depots, etc., throughout the Pacific Coast. Our advertising columns are the best patronized of any weekly paper west of the Rocky Mountains. Our advertisements are longer continued than those of any other paper. As to the value of the Scientific Press as an advertising medium, we refer to our list of patrons. No paper in the world has a better class of intelligent, reliable customers.

We would call particular attention to our

SCOTT & ECKART CUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Offs at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 50 or 60-horse power with ease and economy. Awarded silver medal. Wm. Burnett, Mont'y Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Plainers, Shapers, Drills, Etc.

On hand and for sale. Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon. etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.
8v19-6m

Ayer's Cherry Pectoral,

For Diseases of the Throat and Lungs, such as Coughs, Colds, Whooping Cough, Bronchitis, Asthma, and Consumption.

Probably never before in the whole history of medicine, has anything won so widely and so deeply upon the confidence of mankind, as this excellent remedy for pulmonary complaints. Through a long series of years, and among most of the races of men it has risen higher and higher in their estimation, as it has become better known. Its uniform character and power to cure the various affections of the lungs and throat, have made it known as a reliable protector against them. While adapted to milder forms of disease and to young children, it is at the same time the most effectual remedy that can be given for incipient consumption, and the dangerous affections of the throat and lungs. As a provision against sudden attacks of *Croup*, it should be kept on hand in every family, and indeed as all are sometimes subject to colds and coughs, all should be provided with this antidote for them.

Although settled *Consumption* is thought incurable, still great numbers of cases where the disease seemed settled, have been completely cured, and the patient restored to sound health by the *Cherry Pectoral.* So complete is its mastery over the disorders of the Lungs and Throat, that the most obstinate of them yield to it. When nothing else could reach them, under the *Cherry Pectoral* they subside and disappear.

Singers and Public Speakers find great protection from it.

Asthma is always relieved and often wholly cured by it.

Bronchitis is generally cured by taking the *Cherry Pectoral* in small and frequent doses.

So generally are its virtues known that we need not publish the certificates of them here, or do more than assure the public that its qualities are fully maintained.

Ayer's Ague Cure,

For Fever and Ague, Intermittent Fever, Chill Fever, Remittent Fever, Dumb Ague, Periodical or Bilious Fever, &c., and indeed all the affections which arise from malarious, marsh, or miasmatic poisons.

As its name implies, it does *Cure*, and does not fail. Containing neither Arsenic, Quinine, Bismuth, Zinc, nor any other mineral or poisonous substance whatever, it in nowise injures any patient. The number and importance of its cures in the ague districts, are literally beyond account, and we believe without a parallel in the history of Ague medicine. Our pride is gratified by the acknowledgments we receive of the radical cures effected in obstinate cases, and where other remedies had wholly failed.

Unacclimated persons, either resident in, or travelling through miasmatic localities, will be protected by taking the *AGUE CURE* daily.

For *Liver Complaints*, arising from torpidity of the Liver, it is an excellent remedy, stimulating the Liver into healthy activity.

For Bilious Disorders and Liver Complaints, it is an excellent remedy, producing many truly remarkable cures, where other medicines had failed.

Prepared by DR. J. C. AYER & Co., Practical and Analytical Chemists, Lowell, Mass., and sold all round the world.

PRICE, $1.00 PER BOTTLE.

Sold by all druggists and dealers in medicine everywhere. Crane & Brigham, San Francisco; R. H. McDonald & Co., Sacramento, General Agents. 15v19eow-4m

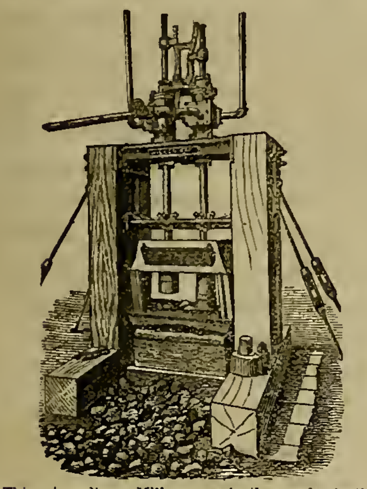
Machinery.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficisncy,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

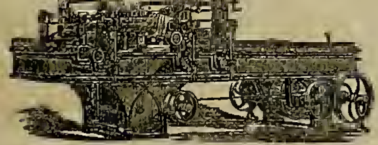
A. BICKNELL, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

Woodworth Planers,



PLANERS AND MATCHERS,

With patent expansion, feed gear and other improvements made at Worcester, Mass., in the most finished and substantial manner; also every description of Richardson Mertam & Co's, Smith's and Wood's celebrated

Wood Working Machinery.

Embracing Mortising, Sash and Moulding, Smith's Stickers, Stat and Door Tenoning, Boring, Shaping, Scroll Sawing, Planing, Rod and Dowell making and Re-sawing Machines, Wood and Engine Lathes, etc., for sale at Eastern prices, at the Machinery Depot of

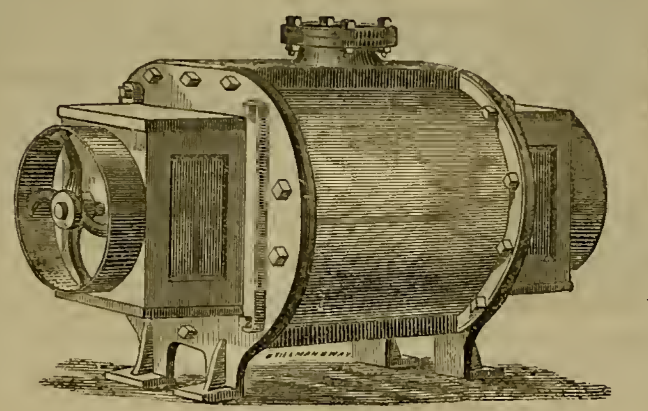
BERRY & PLACE,
112 and 114 California st., San Francisco.

☞Agents for Blake's Patent Steam Pump, (warranted the best in the market); Davis & Furber's Woolen Machinery, etc. Being the selling agents for most first class Eastern builders, millmen and others in want of Machinery can save money by giving us a call. Illustrated Catalogues sent free.

Send former address when you wish your paper directed to a new place.

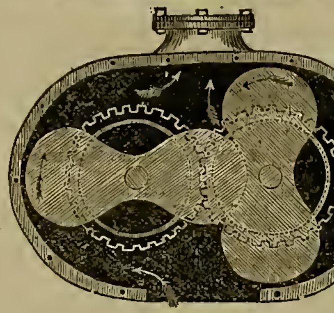
ROOT'S PATENT FORCE BLAST ROTARY BLOWER
MANUFACTURED BY KEEP & BARGION,
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont street,

1v1 San Francisco.

TO DEALERS AND CONSUMERS
—OF THE—
H & L
AXLE GREASE.

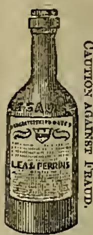
Having received your liberal patronage and support during the last fifteen years, and desiring to further extend its consumption, and if possible meet the market of our Chicago friends, we have made a great reduction in prices, and from our long experience we will satisfy you that there is none BETTER, and through your liberal patronage that there is none CHEAPER.

HUCKS & LAMBERT,
144 Natoma Street.

Depot, 320 Jackson Street.

N. B.—We are prepared to furnish Bulk Packages to contractors on equally liberal terms.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.



CAUTION AGAINST FRAUD.

Declared by Connoisseurs to be the only good Sauce. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for Lea & Perrins' Sauce, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-1yeow

IN THE PROBATE COURT OF THE CITY AND County of San Francisco, State of California.

In the matter of the Estate of ABRAHAM CREEMER MESSERVE, deceased.

On reading and filing the petition of Benjamin Shellard, Administrator of the estate of Abraham Creemer Messerve, deceased, setting forth that he has filed an account of his administration upon said Estate in this Court, and that the same has been duly heard, allowed, and confirmed; that more than ten months have elapsed since the publication of notice to creditors, and that no claims against the said deceased have been presented to said Administrator, and the Estate is in a condition to be closed, and that the real property remains to be distributed among the heirs of said deceased; and praying, among other things, for an order of distribution of said real property among the persons entitled,

It is ordered, That all persons interested in the Estate of Abraham Creemor Messerve, deceased, be and appear before the Probate Court of the City and County of San Francisco, at the Court Room of said Court, in the City Hall, in said City and County of San Francisco, on the seventh day of February, A. D. 1870, at eleven o'clock in the forenoon of that day, then and there to show cause why an order of distribution should not be made of the real property of said Estate among the heirs of said deceased according to law.

It is further ordered, That a copy of this order be published at least for four successive weeks before the said seventh day of February, A. D. 1870, in the Scientific Press, a newspaper printed and published in said City and County of San Francisco.

SELDEN S. WRIGHT, Probate Judge.

STEEN & CUSHING,
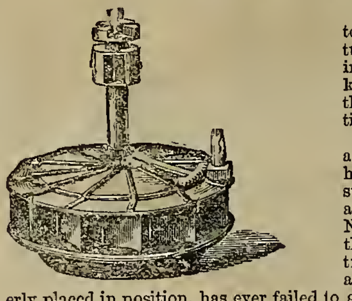
No. 9 First street, San Francisco.

LEFFEL'S DOUBLE TURBINE WATER WHEEL.

MANUFACTURED BY

LEFFEL & MYERS, Portland, Oregon, and San Francisco, Cal.

P. S. SANDERSON, General Agent, Nos. 112 and 114 California Street, San Francisco.



We desire to call your attention to LEFFEL'S DOUBLE TURBINE WATER WHEEL, and in so doing, to state that our Wheel is no longer an experiment, and that it is by far the best Turbine manufactured is demonstrated by the fact that there are nearly 10,000 of our wheels in successful operation in the United States, and also in the fact that in many instances it has displaced the Jonval, Wynkoop, Tyler, Parker, Burns & Welsh, and Stout, Mills & Temple, and many other turbines, with thousands of overshots. Among the many merits of the Leffel Wheel, we desire to call your attention especially to the following:

FIRST.—Power is pledged equal to any overshot in existence. SECOND.—Its great strength and durability. THIRD.—Its great economy in use of water. FOURTH.—The saving, over the heavy gearing necessary for an overshot. FIFTH.—Not liable to get out of order. SIXTH.—Being submerged, is not affected by frost or ice. SEVENTH.—Its steady running, under variable heads, and with variable quantities of water, without perceptible decrease in economical results. EIGHTH. No waste or leakage when the wheel is not in motion. NINTH.—No weight on, or wearing out of the step. TENTH.—We make the manufacture of our wheel a specialty. Other wheel manufacturers carry on a large manufacturing business, making it impossible for them to pay the necessary attention to the construction and finish of a perfect wheel. ELEVENTH.—No Leffel Wheel, properly placed in position, has ever failed to give complete and entire satisfaction. TWELFTH.—In our public tests, we have triumphed over all competitors.

It is our desire that parties contemplating purchasing should always judge of its merits by seeing the wheel in operation, we therefore give the following list of Leffel Wheels in use on this Coast, the names and Post Office address of the parties using them, the size of wheels, head and fall, and the character of work done. We beg of any one in want of a Wheel, to go and see it in operation, and if that is impossible, write to the parties using them and get their opinion.

On application, we will forward to your address our new ILLUSTRATED CATALOGUE of over 100 pages, containing tables of head and fall, horse power, number of revolutions and quantity of water required, a table of wheels from 5¾ to 66 inches in diameter, under 3 to 100 feet fall. Also illustrations and directions of the manner of placing the wheels in position, sectional views of the same; a partial list of the wheels in operation in each State in the Union, and particulars concerning them; together with hundreds of testimonials in its favor by the most prominent Cotton, Paper, Woolen, Saw and Grist Mills in the United States. Also Price List, which has been reduced 30 per cent.

OREGON.

WOOLEN FACTORY, W. W. Manufacturing Co., Salem, 48-inch wheel, 17 feet fall, partial gates; drives all the machinery for 16 set mill. Displaced center discharge wheel.

FLOUR MILL, W. W. Manufacturing Co., Salem, 48-inch wheel, 24 feet head; drives 5 run burrs and machinery; manufactures 500 barrels in 24 hours. Displaced three Shipley and one Upham wheels, 4 feet in diameter.

FLOUR MILL, —— Saxey, McMinnville, 15-inch wheel, 36 feet fall, partial gates; drives 2 pair 40-inch burrs and machinery. Displaced 32-foot overshot.

SAW MILL, Springfield Manufacturing Co., Eugene City, 40-inch wheel, 20 feet head; drives donble circular lathe saw, cut-off, planer, etc. New mill.

FLOUR AND SAW MILL, J. B. Harker & Co., Oradel, Union Co., two 30½-inch wheels; 17 feet head. One drives saw mill outs 10,000 feet in 10 hours; the other drives flour mill, three pair burrs and machinery. Displaced Jonval wheel.

SAW MILL, John West & Co., Westport, Clatsop Co., 23-inch wheel, 24 feet head; drives 54-inch circular saw; half gates; cut 1,000 feet per hour. Displaced Upham wheel.

PLANING MILL, John West & Co., Wesport, Clatsop Co., 17-inch wheel, 16 feet fall; drives Woodworth planer, and 18-inch circulasaw.

SAW MILL, H. Kelly, East Portland, 15-inch wheel, 29 feet head; drives 40-inch circular saw, cuts 500 feet per hour. Displaced overshot.

FLOUR MILL, Imperial Mills, Oregon City, 30½-inch wheel, 13½ feet head; drives two pair 40-inch burrs, manufactures 150 barrels flour in 24 hours. Displaced Harding wheel.

FLOUR MILL, Miller, Marshall & Co., Oregon City, 35-inch wheel, 20 feet head; partial gates; drives three pair burrs and machinery: manufactures 250 barrels in 24 hours. New mill.

FLOUR MILL, Palmer & Brown, Dayton; variable head, from 3 to 21 feet, 35-inch wheel; drives three pair burrs and machinery. With full water makes 300 barrels in 24 hours. New mill.

FLOUR MILL, French & Co., Forest Cove, Union Co., 20-inch wheel, 34 feet head; drives two pair burrs and machinery; with partial gates. New Mill.

FLOUR AND SAW MILL, Chambers & Bowen, Baker City, Grant Co., 20-inch wheel, 30 feet head; drives each mill alternately. New mill.

FURNITURE FACTORY, Luelling & Co., Milwaukie, 20-inch wheel, 11 feet head; drives 40-inch circular saw; 10-inch wheel drives turning lathes, etc. New mill.

WOOLEN MILL, F. Keil & Co., 30½-inch wheel, 7 feet head; drives carding machines and planer. New mill.

SAW MILL, E. Y. Hallock, Dallas, Polk Co., 20-inch wheel, 24 feet head; drives double circular saw, planer, etc. Displaced overshot.

WOOLEN FACTORY, Ashland Woolen Manufacturing Co., Ashland Mills, Jackson Co., 23-inch wheel, 30 feet head, partial gates; our set mill. New mill.

FLOUR MILL, G. T. & J. N. Gilfrey, Pleasant Hill, Lane Co., 15-inch wheel, 24 feet head; drives one pair burrs and machinery. Displaced overshot.

SAW MILL, Robt. H. Scott, Silverton, Marion Co., 26½-inch wheel, 24 feet fall; drives 54-inch circular saw, cnts 6,000 feet in ten hours. New mill.

SAW MILL, A. Myers, Portland, Oregon, 15-inch wheel, 60 feet head; drives double circular saw, etc. New mill.

FLOUR MILL, J. H. Foster & Co., Albany, three 48-inch wheels, variable head, from 3 to 9 feet. Displaced tub wheels—capacity increased five times; drives five run of burrs and machinery.

IRON FURNACE, Oregon Iron Co., W. S. Ladd, Pres. Oswego, Clackamas Co., 30-inch wheel, 21 feet head; drives blast fans, etc.

CALIFORNIA.

FLOUR MILL, Gen. John Bidwell, Chico, 30½-inch wheel, 22 feet head; three pair burrs and machinery. Displaced overshot.

FLOUR MILL, Clear Lake Water Works, Lower Lake, 30½-inch wheel.

FLOUR MILL, J. Chanwett, Sonoma, 13-inch wheel, 28 feet head; drives all machinery. Displaced overshot.

FLOUR MILLS, Rogers & Co., Los Gatos, 13-inch wheel, 64 feet head; drives three pair burrs and machinery. Displaced Stevens' Jonval.

SAW MILL, Lynch & Gragg, Santa Cruz, 15-inch wheel, 75 feet head; drives double circular saw, planers, etc; cuts 2,000 feet per hour. Displaced overshot.

FLOUR MILL, Bennett & Larkin, Santa Cruz, 10-inch wheel, with partial gates and issnes, 110 feet head; drives one pair burrs and machinery. Displaced double overshot.

FLOUR MILL, Robt. Orten, Coraletus, Santa Cruz County, 13-inch wheel, 57 feet head; drives three pair burrs and machinery. Displaced 44-foot overshot; partial gates.

SAW MILL, Otis Ashley, Felton, Santa Cruz County, 13-inch wheel, 34 feet head; drives double circular saw, muley saws, etc.; partial gates. Displaced 32-foot overshot.

SHINGLE MACHINE, Coraletus, Santa Cruz Co., 6⅝-inch wheel, 75 feet head; drives shingle machine and planer, cuts and dresses 12,000 shingles in 12 hours. Displaced overshot.

SAW MILL, J. Y. McMillan, near Lexington, Santa Clara Co., 17-inch wheel; partial gates, 42 feet fall; drives double circular saw, etc, cuts 1,000 feet per hour. Displaced Tyler wheel.

SAW MILL, M. Covall, New Lexington, Santa Clara Co., 20-inch wheel, 21 feet fall; drives 54-inch saw; partial gates.

FLOUR MILL, Folsom, 17-inch wheel, 60 feet head; drives three pair burrs and machinery.

SAW MILL, Visalia, 15-inch wheel, 106 feet head; drives double circular saw, etc.

QUARTZ MILL, Deep Spring Valley Mining Co., office, San Francisco, 20-inch wheel, 24 feet head; drives five stamps and machinery.

FLOUR MILL, Abel Stearns, Los Angeles, 26½-inch wheel, 16 feet head; drives two pair burrs and machinery.

WASHINGTON TERRITORY.

SAW MILL, Lewis Love, Vanconver, 20-inch wheel, 34 feet head; drives double circular, planing, lathe, etc. New mill.

FLOUR MILL, Lonis Love, Vanconver, 13 inch wheel, 34 feet head; drives 54-inch burr and all machinery. New mill.

FLOUR MILL, A. Overholtzer, Walla Walla, 26½-inch wheel, 16 feet head; drives two pair 40-inch burrs and machinery. Displaced Upham wheel.

FLOUR MILL, J. C. Reynolds, Walla Walla, 26½-inch wheel, 16 feet head; drives two pair burrs and machinery. Displaced American turbine.

FLOUR MILL, J. A. Chapman & Co., Walla Walla, 30½-inch wheel, 16 feet head; drives two pair burrs and machinery. New mill.

SAW MILL, J. Hexter, Vancouver, 13-inch wheel, 75 feet fall; partial gates; drives all the machinery of the mill; limited quantity of water.

IDAHO TERRITORY.

SAW MILL, I. P. Lambing, Idaho City, 30-inch wheel 20 feet head; drives donble circnlar saw, planer, cnt-off, etc. Displaced overshot.

FLOUR MILL, Indian Agency, Lapwai, 13-inch wheel, 30 feet head. New mill.

QUARTZ MILL, Monarch Gold and Silver Quartz Mining Co., Atlanta, 13-inch wheel, 30 feet head, 20-stamp mill. New mill.

NEVADA.

QUARTZ MILL, Brunswick mill, Fred F. Coffin, Snpt., Dayton, 48-inch wheel, 19 feet head; crushed 12,000 tons during last nine months, with but one stoppage of 24 hours.

FLOUR AND SAW MILL, Nevada Flat, 26 and 20-inch wheels, 26 feet head.

British Columbia.—SAW MILL, Moore & Co., Burrard Inlet, 26-inch wheel, 34 feet head.

Mexico.—QUARTZ MILL, Colima, 15-inch wheel,

The State Geological Survey.

This subject has again come up before our State Legislature, where it has been discussed on occasion of the introduction of a bill providing for the payment of the unpaid expenses of the survey.

We hope and strongly urge that the survey may be continued. We need it in our State, a very large portion of which is absolutely unknown to us. That a well conducted geological survey is of great *practical* use is shown plainly by the fact that all older countries, which have any high rank in the world, have such surveys and *pay liberally* for their maintenance. They would not all do so, had they not found them to be paying institutions. The value of a survey for our State is inestimable. Can there be any doubt that it is better policy to hire well educated men to direct our miners and prospectors in their operations,—a policy which would give a new impulse to the discovery of our hidden treasures,—than it is to leave our pioneers to grope slowly and painfully in the dark, trusting to chance? It is urged that the survey has as yet produced no practical results; that nothing has been accomplished. Now, in the first place, we are unwilling to concede this. We are of the opinion, it is true, that in many respects it would have been better policy had the operations been confined more strictly to mining matters.—Waiving this point, however, it must be remembered that investigations, such as are valuable, require some time, and a liberal allowance. Has the survey been justly attended to in this latter respect? We think not, nor that it has had a fair trial.

We have a golden opportunity which we ought not to let slip through our fingers. Prof. Whitney is a man of undoubted scientific integrity and ability, as shown by his reputation elsewhere. That his investigations will be made ably and in all honesty, we cannot doubt. He can easily summon to his aid a corps of excellent assistants, of whose capabilities he is cognizant. He has gained a very considerable knowledge of our State already. We know of none more competent for the position.

However, let us have a survey with liberal appropriations, and some good head, whosoever he may be. Let us no longer deprive the State of the wealth, which only awaits a proper search. In the mining interest which has contributed, and will still contribute so largely to our prosperity, we call for investigations which will point out to us where our researches will be most profitably directed. In the agricultural interest, that great mainspring of all wealth, we call for more information with regard to the capabilities of our soil and climate. In the name of the people of the whole State, let us know what we have in this rich but undeveloped and unknown country of ours.

Boiler-Tube Cleaner.

On the engineer who has charge of a steam engine much depends. Such a man ought to have a mechanical education, and to be conversant with all the constructive details of the machine entrusted to his care, and, moreover, to be able to make any small repairs. He can regulate to a large degree the amount of fuel used, and in various ways modify the expense of running an engine. Such a man now-a-days is, we fear, getting to be more and more of a rarity. When found, he should be duly prized, and amply remunerated for his superior care and fidelity.

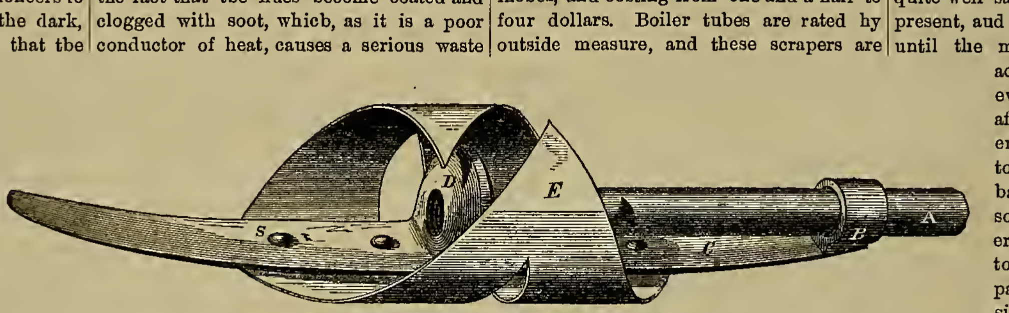
Many engineers are apt (in common with other people) to slight what they consider the smaller details of their duties, and thus to unnecessarily cause waste and expense. One of these details—often too much neglected—is the keeping the inner parts always properly clean. A constantly recurring trouble with regard to boilers is the fact that the flues become coated and clogged with soot, which, as it is a poor conductor of heat, causes a serious waste of fuel. The rapidity with which the tubes become foul depends principally on the fuel used; soft wood and coal is giving off more soot, clog the flues, of course, much sooner than the hard coals. The shape of the tubes and other causes exert also a sensible influence.

Anthracite coal fires, it is said, will foul the tubes sufficiently in one week to cause a waste of from five to ten per cent. of the fuel used; while soft coal or wood will in three days form such a coat as to cause a waste of more than fifteen per cent. Such being the case, it is easy to see how necessary is proper attention to the cleaning of the flues. Some persons, indeed, clear out the flues only when it is no longer possible to get a draft sufficient to make the fires burn; but there are exceptional cases of negligence and waste. Many do the cleaning once a month, or once a fortnight. It would seem that once a week was by no means too often. The saving in fuel will repay the extra labor.

To remove the soot we have a great variety of articles. One of the simplest and most common is a stiff brush; but this hardly does its work effectually, as it removes only the lighter particles of soot and ashes, while the harder scales still remain. Blowing steam through is also apt to be ineffectual. Hence recourse is had to special instruments, of which there is a great variety. The principal points in selecting one of these are, its efficiency, durability and cheapness.

The proprietors of the instrument we illustrate to-day—Morse's patent boiler-tube cleaner—claim general superiority for their patent. It is a very simple tool. S, C, is a bar of iron, of the shape shown in the cut, having a ring, B, at one end, through which the handle, A, made of three-eighths gas-pipe, is inserted, and which is attached firmly to the scraper, by being screwed into the projection, D. The curved blade, E, is made of the best spring steel, and possesses sufficient elasticity to press evenly and firmly against the side of the tube, so as to remove all scale, while it does not injure the iron. The button, D, serves, moreover, to hold the soot and ashes.

The simplicity of the contrivance insures its durability, and renders it possible to furnish it at a small expense. There are eleven sizes, ranging from two to five inches, and costing from one and a half to four dollars. Boiler tubes are rated by outside measure, and these scrapers are rated the same as the tubes they fit.



MOORE'S PATENT BOILER-TUBE CLEANER.

This cleaner is in use at many of the establishments using steam in this city, and is said to give good satisfaction. Messrs. Steen & Cushing, No. 9 First street, San Francisco, are the general agents for the coast, and to this address any inquiries for further information may be sent.

* * *

The Largest Yet.—We have been shown a piece of copper plate, for quartz mills, which has been electro-plated with silver. The piece is four by four and a half feet, and is said to be the largest yet subjected to this process here. Copper plates are thus treated to render them easier and better for amalgamation. Messrs. Haynes & Lawton, Pacific Plate Works, 520 Sansome streets, San Francisco, have prepared these plates, which are said to be a great improvement over the simple copper. At least so says the superintendent of the S. S. Banner mine in a letter ordering more. This firm does, also, a large business in the way of plating all kinds of ware, of which we propose to give a detailed description in a week or two.

* * *

Fossil Wood from Oakland.—The *Alta* received last week some specimens of wood found, at a depth of 360 feet from the surface, while boring an artesian well for the Central Pacific Railroad. It is stated that the auger went through several feet of the wood.

Excessive Legislation.

There is a gentleman who apparently considers that our poor National Constitution needs continually new adornments and improvements to bring it up to the spirit of the times. He may be right, and certainly has the example of many others in his favor. While we in this State are busy discussing the Fifteenth Amendment, which has not yet been attached to the main constitutional body, Mr. Pomeroy, of Kansas, proposes another additional member, in the shape of a sixteenth amendment, which relates to suffrage. By this the franchise is to be extended to almost everybody, without distinction of age, sex, color, condition or anything else.

We hardly expect any immediate serious result from this proposition. The gentleman from Kansas is, we fear, rather in advance of the rest of the country. We may be obliged, at some future time, to come to some such measure, but we ourselves are quite well satisfied with what we have at present, and prefer to defer any such law until the millenium has arrived. The action of Mr. Pomeroy is, however, particularly noteworthy as affording an example of the eagerness of our worthy legislators to get up some new law, or to have their names attached to some new amendment; an eagerness which is getting to be too rabid and common to be particularlyagreeable to us outsiders. This evil of excessive legislation is really becoming a very serious matter. Everybody elected to represent a number of people in a legislative body immediately sets to work to invent some new law. For every particular act or possibility of an act; for every little matter, however small, we must have a corresponding legislation. The amount of laws passed is getting to be fearfully large, and bids fair to soon exceed the powers of any one mind to fully comprehend. The legal machinery is in danger of getting so complicated that we may have difficulty in finding any one who is able to keep it in running trim.

We are in hopes that, before we leave this mortal sphere, we may see a reaction set in; that the time may come when it may be considered by the law-makers more desirable to have a set of simple, practical measures, than to be the father of new and hastily-formed legislative acts.

* * *

The Illustrations of the new State Capitol, at Sacramento, which we announced would be published soon in the Press, are necessarily postponed for some two months, on account of the change to be made in the completion of the outside finish of the building, varying it materially from the first design. When the present architect, Mr. Cummings, has the new perspective drawings made, we shall proceed with the engravings.

Wheat in Liverpool, January 26, was quoted at 9s 2d@9s 3d.

Communications.

From Liverpool to London.

[From our European Correspondent.]

London.

I think that the uniform testimony of travelers who visit London is this: It is great, immensely great; but not grand or magnificent. There was an indescribable something which told us everywhere we went, that we were not in America; everything was different—streets and buildings, wagons and carriages, hacks and omnibuses, the dress and manners of the people, all were different. And then there was something decidedly American about us, for everywhere we went we were at once recognized as Americans; no one was stupid enough to mistake us; we began to feel that really we were foreigners.

The Crystal Palace.

Our first visit was to the Crystal Palace at Sydenham. It is well known that after the last World's Fair, this building was purchased by a few private individuals and taken to its present position by private parties. This was one of the most public spirited enterprises that has come under my observation in England. In Sydenham it is beautifully located, in the midst of the finest park in England, and everything possible is done to make it attractive. The fare to and from London, by railway, and the admission fee are so small, that almost all classes can visit it as often as they choose. And I may add that on a single afternoon more than 11,000 tickets were sold.

The original form of the building is preserved; and we have a beautiful main building, with its glass dome and two lateral wings. These stand on a beautiful rise of ground, and in front is the park, or better named, the garden, with beautiful flowers and fountains. I will make no envious comparisons, but say that it was almost beyond description. There was in the park a small lake, and on one side a beautiful coal seam, actually taken from a coal mine brought there, and close by a fault, and, grouped all around, were illustrations of geology. There were all the old monsters of the Tertiary system reproduced, and very life-like in their appearance—the Megalosaurus, Pterodactyl, Plesiosaurus, etc.—and then there was an illustration of the action of the water upon the limestone rock, gradually dissolving them and wearing them away, or in another place forming a cave—all was very interesting and instructive, and I could not help thinking that it was a most humane idea to offer so much instruction and in so easy and interesting a way to all who wished. Then, too, there were plants, flowers and trees from almost all parts of the world, and the grouping of trees and flowers was beautiful. The merest sketch of the inside is all that I dare attempt. As you enter and pass from room to room—for one cannot have much time to spend in any one place, if he intends to see the whole building at one time—I say, as you go from room to room, you can still see on exhibition many articles that have taken premiums at the previous Fair, and I have no doubt but this is as good a means of advertising as can be found. You see, as I heard dozens of people exclaim, everything. This exhibition of goods is fine, and would be worth a visit here. In the center building, that is often used for concerts, is a beautiful collection of plants from the tropics, tree ferns and palm trees, and numberless other plants, which here grow and flourish beautifully. And then to the right and left are representations of the architecture of the Greeks and Romans, with their beautiful fresco, that make one recall his classics. And then there are works of art that are of real merit, such as sculptures and casts, that add immensely to the effect. I do not know how it is, but I have seen all that I have seen here grander and more beautiful, and yet not so impressive. There was a simple and unostentatious plan of exhibiting everything, and then, too, the good free sunlight that made the building seem warm and cheerful, so that altogether the effect was very fine. I was particularly pleased with a representation of a Pompeian house which a friend who was with me, and who had spent a long time in Pompeii studying the architecture of that old city, pronounced almost perfect. There was beauty in the fresco colors that could not be described. There was the cave cameo on the doorstep as you entered, and apartments to right and left for servants and parties; and then as you passed through the open court, close by, a door opened into a dining room, where the table was ready spread, and there were the couches for the guests. This must serve as an example. There was the same elaborateness all through the building.

Perhaps the most magnificent display of all was the fountains. The water is pumped up something more than 100 feet, and then at three o'clock every afternoon is allowed to play in the different fountains. Night found us still here, and tired, as one well could be, yet happy in the recollection of such a pleasant day.

Mills and Mines of Colorado—No. IV.

BY ALMARIN B. PAUL.

[Written for the Scientific Press.]

The Freiberg Mill, situated just below Empire, I have examined with some interest, not because it has proved so profitable, but, on the contrary, because it has proved an expensive failure. The extensiveness on which it was erected, leads me to suppose that at least $100,000 were expended upon the experiment.

The Keith Process

Is that for which it was built. The ore is first reduced by the Dodge crusher, of the same style as that used by Mr. J. D. Hunt, at Booth's Foundry, in your city. From two of these crushers it is conveyed to a stave-barrel pulverizer, where balls reduce it to a powder. From these barrels it is conveyed to bolters, when the ore is ready for the process, which consists mainly in the peculiar construction and operation of the furnace. The hearth is about 8x10 feet, and supported underneath by an arch, which forms, at the same time, a chamber for heating the air which is to be injected into the furnace, as I will hereafter show. In front of this structure is a circular fire-place, about 20 inches in diameter and say 3 feet high, which is fed by small wood. At a point which strikes the body of the flame from the small furnace, center two pipes—one, a feed-pipe for the ore, and the other for the blast.

The Operation.

The blower, which is about 40 inches in diameter, is throwing a heavy blast into both the fire-place and the furnace-hearth, and at the same time a stream of ore falls into the heated blast, both going together into the furnace-hearth, which has now become very hot. Here the ore settles. There is sufficient heat got up to make clinkers to a considerable extent. The heated air is produced by running air-pipes through the arched chamber, which receives the blast from the hearth, and from whence it passes on to a brick stack some thirty to forty feet high. The desulphurizing ore, or ore in whatever state it may be, is drawn off the hearth to the back end of the furnace, where it is carried off in its heated state by blowers to another small pulverizing cylinder, where the coarser particles are more finely reduced, when it flows off into "dolly tubs," or wooden tubs of three feet diameter, with stirrers. Into these tubs a constant stream of ore and water flows in and out. Thence it flows into wooden arastras, thence off over copper plates, and *down the creek*. Some may say there is nothing in this establishment on account of its being a failure, while I think there is a great deal—it is a reef on which others will be sure not to get wrecked.

Ideas on Desulphurization.

To my mind, all this expensive system of desulphurizing, or desulphurizing at all of *gold* ores, is a humbug.

In Colorado, as in California, thousands upon thousands have been expended on desulphurizing furnaces for gold ores, and what has it amounted to? In neither place has there been sufficient extra yield to pay the interest on the money invested for their erection. It is this that has injured, to a great extent, the mining interest.

I note your observations under the heading of friendly criticism. They are well timed, and should be observed for general information. In my observations of Colorado mining and milling I hope to hurt no one's feelings, nor to injure them in the least; yet I have knocked around among these granite peaks and over Nature's wilds too much to fence up my ideas when I desire to express them. By frank expressions we get at facts. If I can show Coloradans their faults, I propose to do it, not to injure, but to benefit them—at all events, give them California ideas.

Dressing of Ores—A Freiberg Process.

[Written for the Scientific Press.]

In the former communication, the special treatment of the separation ore (class A) was spoken of. It now remains to describe the processes which the stamp-mill ore (class B) undergoes, after being coarsely broken by an ore crusher, in common with certain products of class A, which were noted as being sent to the stamps.

The Stamp Mills

Are two in number, and are situated on the hill-side in such a manner that the ore continually descends in the process of treatment, and, moreover, so that the water-power at hand can be used for both mills. There are two water-wheels used to drive the stamps—one in each mill; the upper driving 24, the lower 18 stamps.

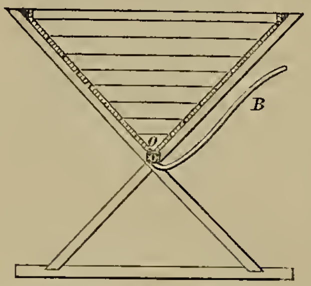

Fig. 1.—Cross Section.

In regard to stamps, the Germans are behind California, or, at least, those which they are using, would never answer for our conditions. It should be remembered, however, that with them great speed in crushing ores is not so important as in our country of high prices. Those used at the Kur-Prinz weigh from 250 to 300 pounds, have a fall of 12 to 16 inches, and strike 50 to 60 blows per minute. They have wooden stems with a square horizontal section. Each stamp crushes in 24 hours about one ton of the ore. The shaft is of wood, 2½ feet in diameter, and is provided with four cams for each stamp. Six stamps form a battery, and about one cubic foot of water is used for each stamp. These figures are better adapted for economy and where only a certain amount of water-power is available, than for the conditions of our country. The slimes from the stamps pass through troughs to an elevating and sifting wheel, which is four feet in diameter and fifteen inches wide. The grains too large to go through the sieve on the outer circumference of the wheel are elevated, and carried back to the stamps. The rest flow through troughs to a series of

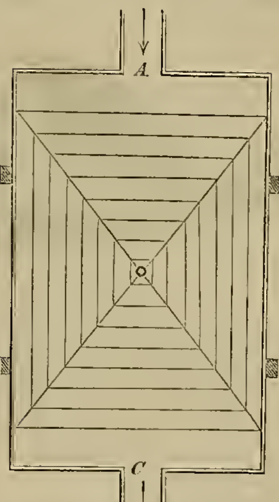

Fig. 2.—View from Above.

Pointed Boxes.

These are used for the purpose of sizing the grains, and answer the purpose excellently; being at the same time inexpensive, and saving much manual labor. They are of the shape of inverted rectangular pyramids, and are of various sizes. Fig. 1 gives a cross section, and Fig. 2, a view from above of one of these boxes. The slimes flow in at A, the heavier grains fall to the bottom at *o*, and are carried off continuously by the water through the pipe, B, and discharged at any required point, saving all handling. The finer particles, which are too light to settle in the limited time occupied by the passage of the current through the box, are carried over the trough, C, into the next box.

By regulating the size of the box, or, in effect, giving the grains more or less time to fall, they can be sorted very nicely—a process on which too much stress can hardly be laid. The first box is the smallest and the current the quickest; therefore the coarsest grains are first collected. Each succeeding box is of larger dimensions than the preceeding, and, therefore, collects a next smaller size of grain, until only the very finest escapes at the end of the set.

The Different Sizes.

At the Kur-Prinz mine there are eleven pointed boxes, which are placed in convenient situations, and which have the following dimensions.

No. 1—3½x4 ft., and 2 ft. 5 in. deep.
No. 2—6½x4 1-6 ft., and 3 ft. 6 in. deep.
No 3—10x6 ft., and 3 ft. 6 in. deep.
No. 4—12x10 ft., and 5 ft. deep.
No. 5—18x10 ft., and 6 ft. 6 in. deep.
No, 6 and 7—10x9⅔ ft., and 7 ft. 6 in. deep.
No. 8 and 9—13 5-24x9 7-12 ft., and 8 ft. 6 in. deep.
No. 10 and 11—15¾x9 ft., and 8 ft. 8 in. deep.

The whole surface presented for the settling of the ore amounts, then, to about 1,132 square feet. The amount of ore stamped daily is about 50 tons. This amount is disposed of as follows: The sifting wheel returns 4.41 per cent.; the first pointed box, 43 per cent.; the second, 17.85; the third, 7.78; the fourth, 6.53; the fifth, 7.72; the sixth, 1.62: the seventh, 3.33, the eighth and ninth, 4.13; the tenth and eleventh, 2 23; while 1.40 per cent. escapes from the last box and passes into sumps.

For America, it would seem that this apparatus might be used with advantage. The number given above might be greatly reduced. Thus Küstel gives a set of four *similar* boxes as used at Schemnitz, Hungary, which work 20 tons in 24 hours. The dimensions and amounts of sand are:

First box—6x2¾ ft., 4 ft. deep, gives 40 per cent. sand.
Second box—9x5 ft., 6 ft. deep, gives 22 per cent. sand.
Third box—12x9 ft., 8 ft. deep, gives 20 per cent. sand.
Fourth box—16x15 ft., 10 ft. deep, gives 12 per cent. san

The Percussion Tables.

The sorted grains make their exit through a tube, as shown in the cut (and the height and size of which are important factors), and are transported through troughs to the percussion tables.

Into the first pointed-box clear water is introduced through two pipes: one, pointing towards the exit tube, B, helps the carrying off of the grains and also hinders that of the slimy particles which are attached to these; the other points upwards, and prevents the settling of all but the coarsest grains. The exit-pipe, B, is 2 inches wide at the bottom of the box, ¾ inches wide at its other end and rises 14 inches—the dimensions corresponding to a transportation of 30 pounds of ore per minute from the box.

The percussion tables are the old well known form so common in Germany. They are about 12 feet long and 4 feet wide, have an inclination of about 4 degrees, and swing 48 to 52 times per minute. They are not continuous in their working, which, moreover, is so varied under different circumstances and takes so much time and manual labor, that they will not be described further here, as hardly applicable to our circumstances.

[TO BE CONTINUED.]

A New Printing Ink.—According to the Frankfort *Zeitung*, Herr Kirscher, of Cannstadt, has made an important discovery of a new printing ink, which is said to excel all other kinds now in use. An important fact is, that by a peculiar process, the ink can be completely removed from the surface of the paper, at a cost of half a dollar for every hundred pounds of printed paper, and the material is then ready for use again.

◆

Pisciculture.—A number of gentlemen in Nashua, N. H., engaged in fish culture, have, as the result of about two years experiment, 100,000 trout in their ponds, covering about one and a half acres, and they have just placed an immense number of trout eggs in the water to increase the stock.

◆

British Coal.—The total exports of coal from Great Britain during the eleven months ending November 30th, 1869, amounted to 8,965,460 tons, or a decrease of 298,838 tons compared with the exports during the same period of 1868.

Mechanical Progress.

An Englishman's Idea of American Workmen.

The following paragraphs, from an interesting letter to *Engineering*, written by an intelligent English workman in the United States, indicate the difference in styles between the workmen of the two countries: "The height of an American workman's ambition is to discard scribing blocks, surface plates, compasses, and squares, by substituting guides that hold the work in its proper position, and guide the cutting tool. The time spent by an English mechanic in learning to line out work, chip, chase threads, and chuck, is employed by an American in learning the simplest form and readiest method of making the aforesaid guides, termed fixtures, to do such work by machinery, which is the quickest, and most exact method of working, and which ensures uniformity. * * Permit me to illustrate one of the advantages of this system. Suppose an English workman to be tapping a hole for a cylinder stud; he keeps putting his square to see if it is being tapped straight, which depends on his skill and carefulness; and even then there are always some holes not tapped true, in which case the cover has to be put on and off, and the holes marked where the studs bind; and then they have to be filed out. Now, by tapping them with a long drill through a guide, the workman *cannot* tap them otherwise than true; it does not depend on his skill, and it does not matter what cover he puts on, it will fit, and a new one can be supplied at any time with the absolute certainty that it will fit without any adjusting. * * In short, the Americans display most extraordinary ingenuity in getting up tools and devices to do the work without requiring skill or exactitude from the workman; which requires a great deal more knowledge and intelligence than learning to be a skillful handler of tools, and accomplishes the desired object more efficiently and systematically. I never saw a scroll or universal chuck in England. I never saw an American shop without them."

A New Traction Engine.—The *American Railway Times* thus describes an engine now building at Worcester: "There are four small cylinders, all cast in one piece, and all common to one steam-chest or valve box. They have three-inch pistons or seven square inches area each, which connect with three-inch cranks in the usual manner. There are two crank-shafts, with two cranks upon one end of each shaft, and at right angles with each other. A pinion gear is fixed to the outer end of each of these shafts, which drives the traction-wheels by means of a large annular gear attached to their spokes. This arrangement gives two cylinders to each crank-shaft and traction-wheel, and the traction-wheels work independent of each other, which will render the passage of curves very easy. The usual 'link' valve gearing is employed, and the steam in the four cylinders is at once reversed by one movement of the reversing lever. The boiler is an upright one, and is surrounded about midway with a strong iron ring, which forms a part of the framing of the engine. The journals upon which the traction-wheels work are fixed to this ring exactly opposite each other, so that the boiler occupies a position central between the traction wheels. The boiler is not confined to the ring, but rests upon two easy springs situated near the hubs of the traction-wheels. The placing of the boiler upon independent springs necessitates, of course, the use of flexible steam and supply pipes."

Iron Progress.—The Ironton (Ohio) *Register* says: More pig iron was produced in this region last year than ever before, and for the coming year we expect an increase of 30 to 50 per cent. In this region, four new furnaces have been erected, and a number that were compelled to stop during free trade times put in blast again. A large number of new furnaces have lately gone into blast in the Mahoning region. Pennsylvania can boast of a wonderful increase. The Carondelet region in Missouri is filling up with furnaces. A number of stacks have been erected in Illinois. Indiana is building furnaces over her beautiful coal fields. The worn-out stacks in Tennessee are being repaired, and new ones erected. The Marquette country is blazing with fresh fires. All over the country, wherever Nature has laid a store of coal and ore, new stacks are going up.

Patching Boilers.

The *Engineer* for December 17th has an article upon this subject, called out by a recent fatal explosion, in the course of which several other similar cases are cited. We quote a paragraph or two from the article:

"There is hardly any operation connected with the repair of a boiler more productive of danger than that by which rivets are brought into a line. The day is gone by, we hope, when in new boilers the longitudinal seams are made to run in a continuous line from end to end, with the transverse seams also continued completely round the boiler, giving at the corner of each plate four thicknesses of iron. Yet unskillful repairs often produce continuous lines of rivets at the very place in a boiler where it is most desirable that there should be the brick wall-like arrangement of the seams, which adds much to the strength, and also often prevents a rent from continuing forward to a dangerous point." * * "I believe," said Mr. E. B. Martio, from whose evidence at the inquest last Friday we have been quoting, "the cause of the explosion was simply that this frequent repair had so reduced the strength of the boiler that it was unable to bear even the usual working pressure. It is often difficult," he adds, "to convince those who have the repair of boilers that the putting of patch upon patch reduces the strength of the boiler, until it is completely untrustworthy, although it may not leak; but several explosions this year, and very many in past years, have proved the fact beyond dispute."

The Allibon Boiler.—This is a vertical high-pressure annular steam boiler, described in the January number of the London *Artizan*. We quote: "The body of the boiler and the fire box are constructed separately as distinct parts, the water and the flue spaces being disposed annularly. The outer part consists of the external skin or shell of the boiler, and a concentric inner cylinder is riveted thereto near the bottom, a wrought iron ring being interposed to keep the proper distance apart. This inner cylinder is also firmly stayed to the shell by screwed stays placed at suitable distances apart. To the top of this inner cylinder a tube plate is riveted which is also connected with a central pendant annular water space, descending to within a short distance of the furnace bars. Thus the fire box proper consists of two rings forming an annular water space round the furnace, the inner ring being made slightly conical to give a better heating surface, and at the same time permit the steam to get away freely. The top of this fire box is connected to the tube plate by a series of short lap, welded tapered tubes, screwed at both ends."

To Color Mica.—Dr. Schwartz suggests this method of coloring mica blue for spectacles, instead of sticking colored gelatin on them, or interposing a layer of it between two of mica, as has been recommended. "What is known by painters on porcelain as 'copper luster' is an organic compound of bismuth with a small amount of gold. When this is put on porcelain and burnt in with a gentle heat, it gives a copper-red lustrous mirror. The same solution, painted very thin and equally on the mica, and dried, may be burnt in by the heat of a spirit lamp, and will show by reflected light the same copper-red color; but by transmitted light, as when the spectacles are worn, the color seen is a bright blue. Platinum and gold glaze, applied in the same way, and burnt in, exhibit a silvery or golden luster by reflected light, but by transmitted show gray or greenish blue color."

Economical Steam Engine.—John Carnes sends the *Scientific American* a description of the engine which runs his saw-mill, and which he claims will answer with the necessary conditions for economical works: "The cylinder is 10-inch bore, and 14-inch stroke; steam chest extends enough beyond the ends of the cylinder so that the steam travels only 2¼ inches, the shortest distance possible, after leaving the valve before it reaches the piston-head, and the space between the piston head and cylinder-head is only one-fourth of an inch, the bolt heads being counter-sunk until even. Other things about this engine are in proportion. With this engine attached to a direct acting circular mill, I can saw 2,000 feet of hard-wood inch boards in one hour."

Scientific Progress.

Correlation of Vital and Physical Forces.

Prof. Barker delivered, on the 31st ult., the third of the series of lectures now in progress before the American Institute. No more interesting subject can be imagined than the one chosen by him;—the one named in our heading. We would gladly give the whole of the lecture were it possible. But we must limit ourselves to a very brief extract:

"The food of the plant is matter whose energy is all expended; it is a fallen weight. But the plant organism receives it, exposes it to the sun's ray, and, in a way yet mysterious to us, converts the actual energy of the sunlight into potential energy within it. The fallen weight is thus raised, and energy is stored up in substances which now are alone competent to become the food of the animal. The food is not such because any new atoms have been added to it; it is food because it contains within it potential energy, which at any time may become as actual as force. This food the animal now appropriates; he brings it in contact with oxygen, and the potential energy becomes actual; he cuts the string, the weight falls, and what was just now only attraction has become actual force; this force he uses for his own purposes, and hands back the oxidized matter, the fallen weight, to the plants again to be de-oxidised, to be again raised. The plant, then, is to be regarded as a machine for converting sunlight into potential energy; the animal a machine for setting potential energy free as actual, and economizing it. The force which the plant stores up is undeniably physical; must not the force which the animal sets free by its conversion be intimately correlated to it? * * The actual energy of the muscle is simply the converted potential energy of the carbon of the food. A muscle, therefore, like a steam engine, is a machine for converting the potential energy of carbon into motion. But, unlike a steam engine, the muscle accomplishes this conversion directly, the energy not passing through the intermediate stage of heat."

Prof. Barker goes on to show that not only is *nerve-force* also a transmuted potential energy, but that even *thought power*, the highest manifestation of animal life, accomplishes the conversion of energy. Emotion, or the reception of a thought, causes motion in the needle of a delicate galvanometer properly arranged, although the subject is absolutely quiescent. The brain heat thus exhibited, represents energy which has escaped conversion into thought, just as the heat of muscle in action represents force which has escaped conversion into motion. It may be mentioned in this connection that a muscle develops less heat when doing work than when it contracts without doing it.

We can only add a portion of the Professor's eloquent peroration:

"Even that mysterious power of thought by which man influences the present and future age, is a part of this ocean of energy. But here the great question rolls upon us. Is it only this? * * Here Science veils her face. We have passed the boundaries by which physical science is inclosed. No crucible, no subtle magnetic needle, can answer now our questions. No word but His who formed us can break the awful silence. In presence of such a revelation Science is dumb, and Faith comes in joyfully to accept that higher truth, which can never be the object of physical demonstration."

The Megatherium in Ohio.—The *State Journal*, Columbus, Ohio, says there are now on exhibition in that city some fossilized remains recently discovered in Union county. They were found in drift three feet below the surface, and are similar to the remains of the Megatherium found in other parts of the State. Arrangements were made by Mr. Klippart, of the Geological Corps, to have the skeleton removed with proper care. Before excavations had proceeded far had weather set in, and work has been abandoned. The section of the femur, upper part, with socket ball, is about twenty inches in length. From the part of the skeleton secured, it is estimated that the height of the animal was twelve and a half feet.

Metallic Chromium Not Yet Prepared.—In an article by Prof. C. A. Joy, published in a late number of the *Scientific American*, he says that "all attempts to prepare metallic chromium in any quantity have failed, and it is probable that no one has ever yet seen the pure metal. He names several of those who have made these attempts. Fremy passed the vapor of sodium over chloride of chromium, and obtained chloride of sodium and a powder which he took to be the metal chromium in a fine state of division. This was found under the microscope to be in octahedra. No acids affected it, and it was exceedingly hard. Deville succeeded only in obtaining a mixture of carbon and chromium, by reducing the oxide with charcoal at a high heat. Loughlin says the sesquioxide can be reduced by a mixture of cyanide of potassium and animal charcoal. Bunsen decomposed the chloride by electroysis. Different experimenters give the specific gravity at different figures,—varying from 5.9 to 7.3. It is plain,—says Prof. Joy,—that we know very little of metallic chromium, although its compounds are among those salts best understood.

Indium.—Fremy lately exhibited to the French Academy two ingots of indium obtained from the Freiberg blendes, which were about a decimeter high and a few centimeters in diameter, and weighed 500 grams. They were valued at 20,000 francs.

Preparation of Carbolic Acid.—It is one of the products of the distillation of coal-tar oil. If a portion of crude coal-tar be placed in a retort furnished with a thermometer, and the portion which distils over between the temperatures of 300° and 400° F., collected and mixed with a strong solution of caustic potash, and allowed to stand for some time, a whitish, pasty mass is obtained, which, when acted upon by water, is resolved into a light oil and a heavier alkaline liquid. If the latter be drawn off and neutralized by hydrochloric acid, carbolic acid will be disengaged, in an impure state, in the form of oil. By distilling from chloride of calcium, to remove any remaining particles of water, and exposing the distillate to a low temperature, carbolic acid congeals in the form of long, colorless prismatic crystals, which melt at 35° C., to an oily liquid boiling at 180° C, and resembling, in many particulars, creosote. It is deliquescent, attracts moisture from the atmosphere, and quickly becomes liquid, and continues so at moderate temperatures. It is known by the names of carbolic acid, phenic acid, phenic, phenic alcohol, and the hydrate of phenyle.—*Dr. Little.*

The Lingering Admirers of Phrenology.—The *Popular Science Review* closes a long article under the above title, with the following: "Possibly an analogy may be drawn between the brain and a galvanic battery, and increase of the gray matter of the one be correctly compared with addition to the cells of the other; but as in an electric instrument the working is dependent on the delicacy and fitness of the arrangements quite as much as on the strength of the current which supplies them, so in the case of the mind the result is dependent on the distribution and balance of the faculties and inclinations, and on other circumstances, none of which are proved to have any connection with the mass of cerebral substance. Certain it is that, although there are probably mental characters peculiar to large and small brain respectively, the size of the skull is, as any observer may easily satisfy himself, no good guide to the mental endowments."

Spectrum of the Fire-fly.—Prof. C. A. Young says this is "perfectly continuous, without trace of either bright or dark lines, and extends from a little above Fraunhofer's line C, in the scarlet, to about F in the blue, gradually fading out at the extremities. It is noticeable that precisely this portion of the spectrum is composed of rays, which, while they more powerfully than any other affect the organs of vision, produce hardly any thermal or actinic effect. In other words, very little of the energy expended in the flash of the fire-fly is wasted. It is quite different with our artificial methods of illumination. In the case of an ordinary gas-light, the best experiments show that not more than one or two per cent. of the radiant energy consists of *visible rays;* the rest is either invisible heat or actinism; that is to say, over ninety-eight per cent. of the gas is wasted in producing rays that do not help in making objects visible."

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

MOUNTAIN CO.—*Chronicle*, Jan 15th: The annual report of the Secretary says the amount of tunnel made during the year is 242 feet, at a cost of $32.89 per foot, including supplies on hand. The length of tunnel up to date is 1,765 feet. For the year's run there is a gain of 51 feet the last six months over the first by the use of Giant powder, at a saving of $868.79. The tunnel, according to survey, is 365 feet past the perpendicular of the ledge, and 900 feet below the out-crop. To allow the ledge to dip at an angle of 45 degrees, there is still 185 feet to run.

TARSHISH.—*Miner*, 15th: It is said that the workmen in the upper drift of the Schenectady are in a large and better body of ore than have heretofore been opened. As this is over one hundred feet nearer the surface than any point where ore has been found, it augurs favorably for the continuance in all directions of this deposit.

AMADOR COUNTY.

ONEIDA.—*Ledger*, Jan. 22d: The mill commenced running on Monday, and its 40 stamps can be distinctly heard night and day in this place. It is in perfect order, and works admirably.

AQUEDUCT CITY—Cor. of same: There is a company of miners prospecting the flat, two hundred yards northwest of the old saw mill. They have a small engine running day and night to keep out the water, while they hoist the dirt with an ordinary windlass. Having sunk 30 feet, they are drifting south towards the rim rock. Everything is in good working order, and they feel confident of striking good pay. The whole valley is taken up and recorded, and the claimants are standing aloof, ready to help devour, when the prey is discovered.

CALAVERAS COUNTY.

RAILROAD FLAT—PETTICOAT.—*Chronicle*, 22d: The new mill made its trial run on Tuesday. Everything worked to the satisfaction of the owners. Its crushing capacity is 20 tons in 24 hours, with 10 stamps. It is the intention to add 10 more stamps and a number of pans, to grind the tailings, as soon as the mine turns out ore enough to justify the increase. The power is ample for five times the machinery now in use. The boiler for the hoisting works, was shipped, in Stockton, on Wednesday. They have now, on dump, 500 tons of good pay ore, and enough more in sight, in the 200-foot level, to run their mill two years.

PALOMO.—Work is progressing finely. The present sinking of the shaft for another "back" is nearly completed, and the mine will soon be in a shape to give employment to double the number of stamps now used.

MARIPOSA COUNTY.

BIG LUMP.—*Gazette* 21st: The Oaks & Reese mine, Hunter's Valley, continues to yield rich rock. They took out a week or so ago, one lump, which, when broken up, yielded over $1,700 in gold.

INYO COUNTY.

CERRO GORDO.—Los Angeles telegram, 25th: Sixteen thousand pounds and 200 bars of bullion from Cerro Gordo went forward on the steamer to-day. It contained $500 of silver to the ton; the balance lead.

LOS ANGELES COUNTY.

SOLEDAD.—*News*, 22d: Yesterday, Mr. Harper arrived, bringing some fine specimens of gold bearing rock from a newly discovered ledge, some three miles from the Eureka mill. Some parties worked a mule-arastra 20 days, and took up some $300 in gold as the result. The shaft is down 70 feet.

NEVADA COUNTY.

MINING ITEMS.—Grass Valley *Union*, Jan. 20th: West Eureka ledge is steadily improving. Fair Play has been located on what is supposed to be an extension of the Allison Ranch ledge. J. J. Rogers and others have located a ledge which shows well, supposed to be on the Eureka. The Wm. Penn continues to give forth good rock. Underground, the opened mines are working full-handed.

EUREKA MINE.—Old Ajax Valley mines still keeps up its steady yield. The Eureka pays about $2,000 a day, and does so easily and with little noise. The last nine days run shows $17,000 of gold, not counting the sulphurets.

BRANCH MINT.—*National*, 18th: This mine is on a line between the Pittsburg and McClellan. They have found first-rate quartz, and propose to run a tunnel to cut the ledge 250 feet below the surface. Two extensions were taken up yesterday.

GOOD YIELD.—Same of 19th: A crushing of 24 tons of rock from the Orleans, at Pittsburg mill, was cleaned up on Monday, and yielded $504.

STARTED UP.—*Gazette*, 19th: Nevada Consolidated Co. started up their hydraulic claims at Burrington Hill, on Monday. They use 400 inches of water, and have a head of 250 feet.

LEASE OF A MINE.—Same of 24th: Campbell & Stoddard, of the Norambagua mine, Forest Springs, have leased the same for five years to Richard Fossett & Co. The lessees are clearing out the old tunnel, which is in 1,100 feet, and expect to get to the ledge in a few days.

SCADDEN FLAT.—Ben McCauley's mill is running night and day, money is plenty, men have employment, and "general satisfaction" reigns.

GOOD ROCK.—We were shown on Saturday some beautiful specimens of gold bearing quartz, taken from the 204-foot drift of the Wm. Penn mine. Sixty feet of the mine sold last week for $12.50 a foot. The rock now being raised will yield $60 a ton.

COSMOPOLITAN.—*Transcript*, 21st: This mine has been leased to Rutherford & Co., who are required by the terms to erect a mill which will crush 15 tons in 24 hours, increased to 20 tons. The lease is to extend for three years, or until 25,000 tons of rock are taken from the mine. The parties leasing are allowed $6 per ton, and the owners get all the gold in excess of that amount.

QUARTZ PROSPECTING.—Recently a ledge near the Pittsburg mine, which has not been worked for years, was taken in hand by some practical miners, and a tunnel run. They found near the surface a four-foot ledge, and took out seven tons of rock, the yield of which was $24 per ton.

NEVADA MINE.—Same of 22d: Michael Reese has acquired absolute title to the Nevada quartz mine, the Sheriff's deed to him having been filed yesterday. This is what was formerly known as the Soggs' mine.

IDAHO MINE.—Same of 23d: One hundred and fifty feet, belonging to the estate of John S. Henning, will be sold at Administrators' sale Feb. 25th.

SAN BERNARDINO COUNTY.

A Los Angeles telegram of 24th, says a miners' meeting at Swartout cañon has organized the "Great Western Lime District," the limits of which include the late discoveries in that county.

PLACER COUNTY.

GOOD PROSPECTS.—Auburn *Herald*, Jan. 22d: The late warm rains in the upper portion of the county have been exceedingly advantageous to miners, affording an abundance of water, and they are making the most of it.

A GOOD SPECULATION.—The old Baltimore mill has been purchased by Walton & Co. The engine has been removed and the mill is now run by water-power. We learn that the new owners run through a lot of quartz which was on hand when they bought the mill and ledge, and had about $200 left after paying for all. This mill runs four stamps and is less than one mile from Auburn.

MORMON BAR.—Boles, Crany & Co. are using a No. 2 Graig's globe nozzle on their hard cement with entire satisfaction.

PLUMAS COUNTY.

CARIBOO BAR.—Cor. of Quincy *National*, 15th: The Eagle Co. are prospecting the Upper Cariboo Channel, seven hundred feet above the river, and two hundred above the claims owned by Johns & Lamb. Should the Co. find any thing, there will be lively times, as the channel will afford room for a great number of men. Feng & Co. are preparing for spring water, and have good prospects. Wilson, Thompson & Mather have commenced work adjoining the Eagle Co. Thompson & Mather are at work in their old claim in Wild Cat, and have a large amount of ground prospected that will pay ½ oz. per day to the man. Lamb & Johns have ground prospected that will pay them well to work, but are driving a tunnel. Jo. Buffington has been obliged to suspend work in Wild Cat, on account of scarcity of water. He has a large amount of ground prospected that with 100 inches of water would pay $20 per day to the man. Water can be obtained at a cost of $1,000, and efforts are being made to bring it in. T. P. W. C. Orton continues at work in his old mine in the lower channel. Some say he is making lots of money. Jo. Hickman is at present stripping. H. Chappell is running a tunnel on the north side of Storm's ravine. J. Lineheart, on Jaw Bone bar, continues to work on his old claim. He always has plenty of money to pay his way.

SIERRA COUNTY.

STARTED.—Downieville *Messenger*, 22d: Ksnaka mill has been started on fine looking rock. This mill has not been run for several years, although one of the best in the county.

DROWNED OUT.—Independence quartz mine is at a stand-still, water having driven the workmen above ground. The cause was the breaking of a pump rod. There is now about 150 feet of water in the shaft.

NORTH SIDE.—Cor. of same: The Nip and Tuck have out a larger pile of dirt than there ever was before in one yard about these diggings. They wait the melting of snow to work. The Union Co. are working a good crew of hands, though their claims are not paying as largely as usual, since drawing their pillars on their main lead. Down in Hoboken, Mr. Taber has his cement tunnel in eight hundred feet; and the indications are that he is through the main body, and over a gravel bed. The Bootjack and the Chalcedony claims, which were flooded last summer, are now cleared of water. The last-named is paying, I hear, $10 per day to the hand. The Goahead claims stand still. A corporation was organized last summer, for developing them; but owing to disagreement, no work has yet been done. Gravel was struck in these claims at a depth of 350 feet.

TRINITY COUNTY.

CANON CITY.—*Journal*, 22d: The miners on Cañon creek have had water plenty for a number of days and are hard at work.

THE WEATHER.—The elements are propitious, and we have been favored with a continuous storm through the entire week. Trinity river is higher than at any time last winter.

LEWISTON.—The boys are all at work, and jubilant over their prospects. Kellogg & Cunningham had a cave in their claim on Bolt's Hill, this week, which they challenge the county to match. During the summer they ran a number of drifts 100 feet back, and upon turning the water over the bank the whole of the drifted ground came down at once.

Arizona.

BIG BUG.—Prescott *Miner*, Jan. 8th: We made a visit this week. We found the 10-stamp mill reducing ore from an extension claim on the Eugenie. The mill crushes, every 24 hours, from nine to twelve tons of quartz, and the daily yield of gold averages about $200. Upwards of twenty persons and three or four teams are employed at the mill and mine. We saw the outside plates cleaned up Monday last, after a run of 23 hours, saw the amalgam weighed, and there were 36 ounces, worth, at least, $2.25 per ounce. The gold in the battery was not touched, but allowing that it amounted to three times as much, the little mill pounded out $243,000 in less than 24 hours, out of ore just as it came from the mine.

STERLING.—Mr. Besler has started the furnaces, and is working the tailings by chlorination.

PLACER MINING.—Some ten or twelve men are rocking in the England gulch. About the same number are at work on the Upper Hassayampa, and, at Walnut Grove, some eight or ten are at work. On Lynx creek, there are twenty men engaged in placer mining; at Big Bug, five or six. All are making fair wages. The hydraulic companies are fixing ditches, sluices, etc., and praying for rain.

DEPARTURE OF PROSPECTORS.—Some 25 or 30 able-bodied men started Sunday, to explore northeastern Arizona. All were well supplied with animals, arms, provisions and other necessaries. They intend going to Hardyville, where they expect to get recruits.

Idaho.

ITEMS.—*Tidal Wave*, Jan. 20th: The Golden Chariot shute and ore-house are chock full of No. 1 ore, which has been accumulating faster than it could be taken away on account of the great extent of bare ground. The late storm has, however, obviated the difficulty.

The Ida Elmore mill has been obliged to shut down for a few days, in consequence of the storm having interrupted the regular supply of rock by blocking up the road.

Montana.

PHILIPSBURGH.—Helena *Gazette*, Jan. 13th: The lease of the Stuart mill was delivered to Purvine & Co. on the 2d. Some of the Hope and Comanche rock remaining at the mill since the break down last summer, has just been reduced. Seventy-five tons yielded 253 pounds of silver bars (.830 fine) or $5,060 in currency. Messrs. Purvine & Schnepel, after a few days delay, will start up for the season on rock from Ullery & Merrell's 50 feet Comanche extension; 500 tons of Queen rock will be put through first. The Cole Ssunders is again at work on the Trout, taking out first class ores.

THE CEDAR CREEK MINES.—A. J. Simmons writes from Cedar Junction, Dec. 30th: "I have been here two weeks, and have seen all there is to be seen on the surface, have sent out for my winter's grub, have a cabin about completed, and propose to investigate for myself. This town is at the forks of the gulch. The left-hand fork, on which discovery was made, has plenty of good claims. From sixty below discovery, up, the ground is from four to eight feet deep. Below sixty, no bedrock has been seen, but the deepest shaft—14 feet—has colors all the way. The creek has a big fall, the mountains are abrupt, and the gold is of good quality and coarse in the upper district. I am inclined to believe in the existence of good pay below the forks."

E. Marion writes from Louisville, Jan. 4th: "I have seen $311 panned out in six days by Barrette and Lauthier. In one day they panned out $85, and in this was found a nugget weighing $16. I have the belief that Cedar creek will be the best camp in Montana next summer."

"Stampeder" writes from Cedar Junction, Jan. 3d: "There will not be money taken out in any quantities, before next August or September. Work is scarce, and plenty to do it at $5 per day. The future depends on Oregon gulch, which has nothing but a few prospect holes, and none of them to bedrock. I have prospected four pans out of each of the holes. I got colors in every pan, but not in paying quantities—one-half cent was as big as I could get. Everything in the way of provision is 75 cents per pound."

ITEMS.—Virginia *Times*, 14th: In Ramshorn Gulch, the claims prospect well.... In Bivin's Gulch the miners are getting out dirt, by drifting, in readiness for spring work. Some are thawing out the dirt, and running it through sluices. They make it pay....Work is to be prosecuted in Wisconsin Gulch....Harris Gulch is going to be lively. One man has taken out $300 the past fall and winter, with a rocker. The depth of ground is from two to eight feet. ....On California Gulch, there are four or five companies drifting, and a few rocking. Water has been scarce all the season.

FINE BUTTON.—Hon. G. W. Stapleton, Supt. of the Tootle Co., at Argenta, arrived Wednesday with a silver button smelted from 30 tons of ore from the Blue Wing and Huron lodes. This button is .995 fine, weighs 127 pounds troy, and is of the value of $6,000, coin.

The *Times* says the Cedar Creek mines are a humbug. The promised $25-diggings have vanished. A Helena special says the stampeders are fast returning. Every foot is claimed. Stay where you are, at least until spring.

THE NEW MINES.—Deer Lodge *Independent*, 18th: Mr. J. V. Suprenant has returned from Cedar creek. He thinks that not less than 2,000 men will be employed there next summer. The *Independent* gives the report of several other returned miners, all of whom speak favorably of the prospects.

CEDAR CREEK AGAIN.—The *New North West* of the 7th, says the accounts begin to be conflicting. Prospecting is being done on Cedar, Oregon, Rabbit, Illinois, Wolverine, and Montreal gulches. Simmons & Co. had a shaft down 14 feet at the mouth of Oregon Gulch 10 days ago, and Mr. Tom Condon recorded claim "272 above." At Louisville and Cedar Junction, building is progressing rapidly.

LABORERS WANTED.—The same journal has an editorial headed "25,000 men wanted." We quote: "Five thousand more laborers for wages are wanted, absolutely essential to successful mining, in Deer Lodge county, at not less than $5 or $6, or $7 per day in gold, to go to work on the 1st day of May. In other industrial pursuits, farming, grazing, merchandizing, manufacturing and building, fully as many more could find employment."

New Mexico.

UTE CREEK.—Elizabethtown *Telegraph*, Dec. 25th: The Montezuma mill has shut down, for the reason that the *burro* train could not keep it supplied with quartz. Operations are to be suspended till the arrival of the cable, cars, and other outfit for putting the tramway in order. This machinery, together with the other 15 stamps for the mill, are delayed at the Rattoon mountains by heavy snows.

The agents of the English company have arrived, to tender Mr. Maxwell a payment on the purchase of his grant.

Pease, McCollum & Co. are opening a new lode called the 1XL, recently discovered near Grouse gulch, on Quartz Hill. The vein shows two feet on the surface, and carries free gold in paying quantities.

Nevada.

COPE DISTRICT.

MOUNTAIN CITY.—Elko *Independent*, 19th: Everything is in full blast. The Drew & Atchison mill, which has been idle for 10 days, is again at work. Fuel is not supplied according to contract—hence the delay. The Mill Co. have received 80 tons of rock for crushing, principally from the Great Republic and Mammoth mines.

BRUNO DISTRICT.—The Mountain King has been bonded to Sellers, Tregaskis and Atchison, who intend erecting roasting furnaces. They have run a tunnel 40 feet, and have a large quality of ore out. From an assay made, the rock yields $90 in silver besides the large quantity of lead.

BULL RUN.—Same of 22d: Mr. Crosby expects to have a mill in operation shortly, on Boston capital.

BALD MOUNTAIN DISTRICT.—John Foreman, and Dr. Bailey, came in on Wednesday and brought 100 pounds of handsome ore. The district was organized on the 20th of July. The facilities for milling and smelting are abundant. Five tons of surface ore from the Nevada returned $130 to the ton. This ledge is six feet in width and has been sunk upon 15 feet. The other ledges carry ore in large quantities, which assays from $150 to $4,500 per ton in silver.

ESMERALDA.

PINE GROVE—Gold Hill *News*, 24th. Lieut. Bourne, just in, speaks well of the mines, and says they are looking better than for months.

HUMBOLDT.

RAILROAD DISTRICT.—*Register*, 22d: The storm has stopped work for the present. The Bunker Hill has a fine lot of ore on dump. Wisconsin Chief, on the west side of the range, contains 40 per cent. copper, and $250 to the ton of ore. Chambersburg shows a well defined vein of copper ore of good quality. The Pixley, on the east side, has been prospected to the depth of 10 feet, developing a vein four feet wide, assays from which average $175. But little work has been done on the Bullion.

ORE SHIPPED.—L. C. Pease shipped to the Reno mill for reduction. 800 sacks of ore from the Stars and Stripes mine, Winnemucca district.

DUN GLEN.—Alaska Co. takes out two tons per week, assays $400 per ton. Twenty tons have been hauled to the Essex and Empire mill for reduction. The Tallulah Co. are in 80 feet. They have struck two blind ledges on the way. The Yosemite Co. are going ahead steadily. Gem and Diamond, has been stopped by the weather.

REESE RIVER.

TOIYABE.—*Reveille*, 19th: Yesterday a sample of ore produced by one of the veins cut in the Toiyabe shaft, gave by assay at the rate of $1,516.20 of silver per ton.

BULLION SHIPPED.—Same of 20th: Yesterday and to-day, by the Manhattan Co., nine bars, valued at $15,906.51; by Paxton & Co., 8 bars, $5,000.

BULLION FROM BELMONT.—Talman & Groves brought eight bars, valued at $5,000, mainly from tailings.

YANKEE BLADE.—Same of 21st: The Tuolumne, which is the eastern extension of the Chase, is producing superb ore. From the present condition of the mines in Lander Hill and Yankee Blade the prospects of Austin are brighter than ever.

BULLION.—Manhattan shipped, 21st, overland to New York, six bars, valued at $11,249.56; 24th, five bars, valued at $8,437. For the week, 19,662 ounces.

LATEST.—An Austin telegram, dated 26th, says: The Buel North Star mine, conditionally sold last fall by the Laue and Fuller Company to an English company, has been finally transferred.

The new 20-stamp mill of the Social and Steptoe Company, at Egan Cañon, is in operation.

It is rumored that the Manhattan Co. have bought the Excelsior right to the use of the Stetefeldt chloridizing furnace in this district.

WHITE PINE.

WEEKLY MINING REVIEW.—*Empire*, 23d: Weather has been stormy, and hauling ore unprofitable business, owing to the snow drifts. During the last few days, however, operations in this line have been prosecuted more successfully. Most of the mills have sufficient ore on hand to keep them running to March 1st, and with a few exceptions all the stamps of the district will be kept in active operation during the remainder of the winter.

BULLION.—The product, as shown by the shipments for the week, aggregates $62,412.13. We have no returns of the amount of lead bullion sent forward, though the yield is steadily increasing. The *News* of 22d says: Our shipments of bullion for the week aggregate $51,211.23—of which amount $27,625.65 went West, and $23,585.58 to the East.

MILLS AND FURNACES.—*Empire:* A large number of furnaces are being constructed, some of which will be ready to fire up the present week. An increased number of claims bearing smelting ores are being worked. This character of mining is now considered by many the most lucrative in the district; smelting ores being ready sale on dump from $12 to $30 per ton....*News:* The Alsop smelting works will be, when completed, the largest and most complete in the district....White Pine Works are being enlarged....Walsh's furnaces will be fired in a fortnight....Wieland & Co's shut down on Wednesday, for re-lining. The product of the last run was 18 tons of $200—bullion....Hawthorne also has shut down for re-lining; will start on Tuesday. Van Wyck will start on Monday....The mills of the Eberhardt, the Sheba, Metropolitan and Little Giant, are steadily at work, having been supplied with ore before the storm. The Drake & Applegarth mill, of the Eberhardt, was shut down for a few days, for lack of a supply.

ITEMS.—*News:* Aurora Consolidated improves in appearance daily. Large body of good ore in the face of main tunnel....Alpine shaft 75 feet down....California down 230 feet and taking out ore....Crown Point No. 8 yielding very rich base metal ore....Heavy body of smelting ore in Caroline, some of which assays $135 per ton in silver....Domingo turns out an abundance of low-grade ore worth $40. Wilson & Wadleigh have it on lease, and pay owners $3 per ton....Eberhardt is looking up immensely....Original Hidden Treasure contract not yet awarded....Blue Hill miners generally wait for lower milling prices....*Empire*: Mammoth is to be put in best condition immediately....Worral has 100 tons ore on dump....Alta works five men, who raise 10 tons daily, and are running a tunnel....The poorest ore produced $36 silver per ton....Aurora South employs 35 men in the mine, and has shipped $36,000 bullion in January so far. ....Confidence main shaft is down 50 feet, and work will continue all winter, "rain or shine."

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Jan. 28, 1870.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 60
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

◆

THE PHRENOLOGICAL JOURNAL for January, being the first number of a new series, has been received. It of course argues strongly in its peculiar line, but contains, moreover, a great amount of very interesting and valuable information, by which remark we by no means wish to have it inferred that we consider the phrenological arguments either uninteresting or valueless.

San Francisco Mining Stock Market.

The mining share market, as a general thing, is dull at this season of the year, but at the present time this is the case to a greater extent than in former years. However, prices have been well maintained during the period under review, and, in most instances, an advance has taken place. Since our last issue considerable activity has manifested itself in a number of leading stocks, very large sales of Yellow Jacket having been made; Savage and Chollar-Potosi coming in for large transactions. With regard to White Pine, the *News* of the 22d gives the following: "The storm which raged during the first three days of the current week prevented a continuance of active surface operations, hauling, etc., but the usual activity underground and at the mills was maintained. The working force in the leading mines now running, however, is light, and will probably not be materially increased before the end of March. Base metal mines are still attracting a large share of attention, and at present show more activity than the mines of Treasure Hill. Furnaces are accumulating along the Base Metal Range. Those under way are giving satisfaction and proving profitable, and experiments continue on all hands, looking to the discovery of a material which will withstand the action of the heat requisite for smelting ores containing a large per centage of silver. Our shipments of bullion for the week aggregate $51,211 23, of which amount $27,625 65 went West and $23,585 58 to the East."

CHOLLAR-POTOSI—was less active than during the previous week. For the week ending January 1st, 1,047 tons of ore were extracted, against 1,073 the previous week. It is stated that most portions of the mine from which ore is taken have an improved appearance, as compared with last week. At the 450-level the station is nearly completed, and, when finished, will drive the drift as rapidly as circumstances will permit. On the 25th they connected with the mine and the changes are reported as unimportant.

GOULD & CURRY—was dull of sale. During the week ending January 24th they extracted 334 tons of ore. Nothing encouraging in the old ore localities. At the seventh station the drift running north has clay and porphyry, and the north-west drift black quartz, commonly designated as water quartz. The south drift shows block porphyry, and the south-west drift is in hard porphyry, with some clay and a sprinkling of quartz having no metal. The Superintendent reports "that at no time since drifting was commenced on the seventh station has the prospect for ore been more unfavorable than at this writing. Both west drifts are now 145 feet in length, and they have not yet met with the west wall. These drifts will be continued until the syenite is found."

HALE & NORCROSS—was in moderate request, at improved rates. For the week ending January 22d the upper mine yielded 211 tons, and the lower 1,327½; total, 1,538½ tons. The sixth level contributed 1,305¾ tons of this amount. On hand, 6,467¾ tons, of which 2,369 is low grade. On the 23d inst. the ore-breasts throughout the levels of the old mine exhibited some improvement. The east drift on the 535-level is now 259 feet east of the shaft, and at this point they will turn a branch drift south-east, preparatory to working that portion heretofore untouched, so soon as air is obtained in the present drift. They are continuing the air-winzes above the 780-level, and they hope soon to connect with the east drift from the 535-level. The south drift on the third level of the new mine has intercepted all the water which prevented them from working the south body of ore on the level below. This drift is now in that ore, and is said to be of fair quality. On the sixth level the south cross-cut has passed through three separate clay walls, and is now in the ore of the vein.

OVERMAN—increased in sales toward the close, at better figures. During the week closing January 23d, 689 tons of ore were extracted. The breasts of the different levels are reported to be looking well. Bullion in small lots comes to hand more frequently.

AMADOR (Cal.)—has been in marked favor the past year. We condense the following from the Secretary's report for the year 1869:

RECEIPTS.

Cash on hand Dec. 31, 1868	$11,681 59	
Bullion	656,326 79	
Sundries	38,072 28	
		$706,080 66

DISBURSEMENTS.

Mine account	$160,447 78	
Construction account	25,885 74	
Eureka mill	35,161 22	
New mill	32,366 57	
Salary account	11,922 50	
Dividends Nos. 17 to 29, inclusive, paid to stockholders, $104 per share	384,800 00	
Sundry accounts	53,356 27	
Cash on hand	2,140 58	
		$706,080 66

The total assets are stated to be $160,494 72. The ore to produce the above amount of bullion aggregated 32,510 tons, equal to $20 19 per ton. Cost of mining, 32,510 tons, $4 86¼; milling, $1 97½; total, $6 83¾ per ton.—*Commercial Herald.*

New Incorporations.

The following have filed articles of incorporation with the County Clerk, S. F.:

COLONIZATION AND COMMERCIAL CO., of Bolivia. Jan. 24. Trustees: A. D. Piper, A. Y. Stout and A. W. Von Schmidt. Capital, $10,000,000, in 100,000 shares of $100 each.

PROTESTANT EPISCOPAL CHURCH HOME ASSOCIATION.—Jan. 24. Trustees: Bishop Kip, E. Birdsall, Wm. Hooper, H. F. Williams and Dr. O. Kelly.

The following have been recorded in the Secretary of State's office, Sacramento:

THE SANTA ANNA WATER CO.—San Buenaventura. Jan. 20. Capital, $45,000. Trustees: Walter S. Chaffee, Thomas R. Bard, and William R. Patterson.

MARCELA MINING COMPANY. Nevada. Jan. 22. Capital stock, $90,000. Trustees: C. R. Worlan, R. B. Quinlan, G. E. Herrick, A. T. E. Pritchard and C. C. Palmer.

CALIFORNIA SOUTHERN RAILROAD CO. Jan. 22. Object: To construct a road from Gilroy to Salinas City, Monterey county. Capital stock, $1,500,000. Directors: C. Mayne, Peter Donohue, Richard P. Hammond, H. M. Newhall and N. S. Sweeny.

Meetings, Elections, Etc.

BELCHER M. CO. Jan. 25. Trustees: J. D. Fry, B. F. Sherwood, A. K. P. Harmon, William H. Forbes and George Schultz; J. D. Fry, President; H. C. Kibbs, Secretary; and P. N. Mackay, Superintendent.

BLACK DIAMOND COAL CO. Jan. 26. Trustees: A. Hayward, President; D. O. Mills, William C. Barron, John Bensley and Charles E. McClane.

BELLINGHAM BAY COAL CO. Same officers.

THE GOLDEN GATE SUGAR REFINERY CO. Jan. 26. President: R. P. DeNoon; Vice President, J. J. McKinnon; Treasurer, M. Ehrman; Directors, Nicholas Larco, J. B. McCune.

THE STATE AGRICULTURAL SOCIETY. Jan. 26. C. F. Reed, President; Hon. E J. Lewis, of Tehama, Wm. Blanding, of San Francisco, and W. H. Coleman, of Sacramento, Directors; Robt. Beck, Secretary; R. T. Brown, Treasurer. The next State Fair will be held September 12th, and continue in session seven days.

American Engineers in Other Lands.

For a long time the engineering talent of our country has been decried by the old world, but of late, especially since the construction of the Central Pacific Railroad, Europeans have gradually begun to think that we have engineers who know their business, and, moreover, know how to build roads best adapted to the wants of our country. The English have found that their particular methods, which apply to the densely populated districts of Great Britain, are too expensive for the thinly-settled colonial regions. It is impossible for them to construct their solid railways everywhere; that is, financially impossible. They, therefore, wisely turn to America for the talent and experience necessary. Various reports, more or less definite, have been circulating lately with regard to their decision. The S. F. *Call* states the following definitely.

The Governor-General of India, Lord Mayo, has sent to the United States for an engineer accustomed to the expeditious manner of constructing railways in this country, and at a cost far below that which an English engineer would consider possible. India is yet in want of thousands of miles of railway, and if, by Lord Mayo's experiment, they can be made cheaply, the benefit will be great to all concerned, including English engineers, who may perhaps learn a useful lesson therefrom, and lay down cheap railways in Australia.

In this connection we find the following in the papers:

Silvester Marsh, the proprietor of the Mount Washington Railway, has received a letter from the Swiss Government, inviting him to go to Switzerland and superintend the construction of the road on top of the Rigi.

◆

THE SUTRO TUNNEL is in 630 feet. It has made 88 feet the past week. The ground still continues to be quite favorable.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

The Santa Cruz Farmers' Club.

The Santa Cruz Farmers' Club appears to be a live institution, and no doubt much good will grow out of the organization. We would suggest the propriety of similar organizations in other farming localities. The occasional meeting and conferring together of farmers as to the best method of cultivating the soil, the interchanging of methods employed and the promulgation of experiments, is of the greatest benefit and importance. Many facts may be thus brought out, and by means of the press made known all over the State for the good and profit of all. There is also a mental as well as financial benefit, which flows from such conferences; the mind is made more active, and a love for the business engendered. Farming is thereby elevated and ennobled, as it should be. The isolated condition of farmers has, in times past, served to render them unsocial, less inclined than those engaged in the various trades, to meet together for mutual conference, encouragement and protection. And yet, of all callings, there is scarcely any which can be named that may be more benefitted by such means.

Farming is really more of a science than any other industrial pursuit—its range is wider, its fields are broader. It is more elevating and ennobling in its nature. It is more of an intellectual pursuit than any other. It ought to rank, in the social scale, as the very topmost of industrial pursuits. Education will place it there—it is fast doing so. Every man, woman and child in the land should know something of the *science* of agriculture; it should occupy an important position in every course of study. No grade of education, from the common school to the highest university, should be considered complete without it. Public opinion, within a few years, has taken wonderful strides in this direction, and soon professors in the various departments of agriculture will be found in every college and university in the land.

Those who have already entered upon the active duties of the farm cannot reap the benefits of our improved schools; but they can greatly improve their condition by the formation of clubs and the reading of agricultural books and papers. We need a peculiar school of agriculture in California. Our system of farming here differs widely in many respects from that of other localities. We must work out and establish this system ourselves, practically, by the collection and dissemination of facts within our own territory. No better means to do this can be devised than by the formation of Farmers' Clubs. Let the farmers in various localities thus meet, compare notes, and the PRESS and other papers throughout the State will publish what they talk about, whenever it is of general interest. In that way we shall soon have a more careful and successful system of farming in California. Necessities for our especial conditions will be devised; remedies for the peculiar diseases or insects which afflict our animals, trees and plants, will be sought out; methods for restoring to their original fertility our deteriorating fields, will be suggested and made known to the public, and wasteful and inexperienced farm management will vanish before carefully applied intelligence.

CURRY YOUR COWS.—The *Agriculturalist* strongly recommends the currying of cows and fattening animals. Animals that are stabled need it more than those in the yard, but it is beneficial to both. They like it, and will generally stop eating to enjoy it. It is a practice which should become general and constant.

Have a Care for Little Things.

The great mistake of both farmers and business men in California is the lack of care for *little things*. We are all striving for a big thing—a fortune. Nothing short of that will answer; and to reach it, risks must be assumed. Whatever we attempt, must be on a large scale. We have no time to look after small matters. Little leaks are left here and there; little items of expense that might be cut off are suffered to run on, simply because they are small, with no thought of the fact that a continual outflow of a small stream will soon empty a big pond. Few think of making change closer than ten cents—it would be small to mention it. The carpenter takes but little care of his tools—it is a little thing, and when it is gone he can buy another.

The farmer goes on in the same way. His tools are suffered to lay out, exposed to the weather, without shelter. Barns are but little used; but little needed, they think. Plowing and planting must be done on a large scale, little care being taken as to *how* it is done. Big gangs of plows are used with little teams to haul them; the ground is scratched—not plowed. The struggling rootlets can't get down to the moisture they need, consequently they spread out near the surface, and when the drouth and hot sun comes, the plant shrivles and lacks the power to perfect its seed. In its sickly state it is also open to the attacks of disease—and smut, rust, etc., destroy the farmer's hopes.

Insufficient care is taken in securing and selecting seed—it is a little thing, and hardly worth minding. Too busy to look over the fields and notice where the best growth is producing the grain most suitable for seed. It is too much trouble to separate the few small and shriveled seeds from the bulk of the seed wheat—so ʋ it all and let it grow together; the most of it will produce good grain anyhow; can't expect everyone will raise No. 1 wheat.

Burn the straw? Of course; it is too much in the way; it will make but little manure, after all, and it requires a great deal of work to rot it and haul it out upon the field. Don't have time to do it after the rains come; and then you know we must have a little rest between harvest time and rain fall. We want three or four months to watch the markets, sell our crops, and make our calculations for the next season; because, you see, we are going to put in a big crop next year.

Of course it costs more to plant and harvest 7,000 bushels from 500 acres than it does to obtain the same amount from 300 acres; which we might do by more careful cultivation; but then you know I've got the 500 acres, and I *must* use it.

Not at all, my friend. Suppose you set off a portion of your acres every year for fallowing, until you have in turn rested and improved every acre of your farm. If you will try that plan you will get more wheat in the aggregate, and keep your farm in better condition and with less labor. That is an experiment which never yet failed with land that had commenced to deteriorate.

When we see a farmer omitting all improvements because of a little cost, or subscribing for half a dozen political newspapers, and not a single one devoted to agriculture and useful information; when we see him buying guano and wasting his barn-yard and other ordinary fertilizers within reach, and cheaper, we are always reminded of the story of "A Crack in the Hog Trough." Don't remember it? Well, a farmer somewhere out West, who was notorious for shiftlessness, complained day after day to his neighbors that his hogs ate twice as much buttermilk as his neighbors, but did not grow half as fast. Some good friend finally went to the pen, and on close examination found that about half the swill ran away through a crack in the trough. We fear that there are a great many farmers and business men in California who don't look close enough to the cracks through which their substance is constantly leaking. That's what's the matter in most cases of failure everywhere.

There is a grievous lack of economy everywhere in California. Our farmers, in particular, are too negligent in the care of their lands, and in many other things which go to make up a thrifty husbandman. One of the greatest lacks is in making and spreading manure upon our lands to stop the general complaint about their deteriorating. We recommend to every tiller of the soil, whether he cultivates one acre or one thousand, a careful consideration of this question: How can I best and most economically get a proper stock of manure for my next year's crops? In no way can you do more to increase the yield of your land and the consequent profits of your farm.

The Angora or Cashmere Goat.

The recent importations of a large number of Cashmere goats into this port has caused considerable inquiry with regard to this interesting animal, which we will endeavor to satisfy at an early day. There seems to be considerable speculation in regard to this breed of goats, just at this time, in all parts of the country, and it is thought by many that there is danger of an undue excitement in this direction. We do not entertain any fear on that account; but at the same time would counsel sober careful action.

Experiments on this coast have already fully proven two things—that the climate of California is well fitted for the raising of this goat, as it does as well or better here than on its own native hills, near the Black Sea, and that it is most admirably adopted for improving our common breeds, in regard to both fleece and flesh. The animal is beautiful to look upon, and although quite as mischievous, is almost entirely free from the strong odor so peculiarly offensive in the common goat. Its flesh is also said to be very superior for the table. Their fleeces are long, exceedingly fine, soft and silky. They take color very easily and perfectly. The demand for them in this country, is now chiefly for fancy work, fringes, tassels, etc. They sell in New York, according to quality, which varies greatly, at from $1 to $3 per pound. The cashmere wool may be seen almost any day in the streets of San Francisco, worn by our ladies as fringes to their outer garments.

A HINT FOR CALIFORNIANS.—A western farmer has secured his young apple trees from the depredations of rabbits and mice during the past four years by leaving shocks of corn in the orchard through the winter. He finds that these mischievous creatures will not gnaw the trees when such shelter and feed are at hand. California vineyard and fruit cultivators, who are troubled in this way, as many are, may profit by the above. Better feed such pests to some extent than suffer infinitely more in vain attemps to starve or kill them. A few cats and dogs will always keep them moderately scarce.

SHEARING GEESE AND DUCKS.—A writer in the *Farmers' Advertiser* says: "The usual mode of plucking live geese, is laborious in the extreme, and cruel, as the frequent shrieks of the tortured creatures testify. Shearing them would secure the finer and more choice part of the feathers, and I have no doubt but the geese or ducks would thrive better and yield a coat oftener—and if not with better grace at least with better feelings."

A NEW USE FOR SHEEP.—It is stated that a Vermont farmer hauls wood to market with a team of eight sheep.

Arthur Young on Pyrenean Sheep.

[Written for the Scientific Press.]

Mountain Lands.

MESSRS. EDITORS:—Having been unable to complete this article in time for the last week's publication of the PRESS, the circumstance has afforded me the opportunity to make some remarks on the paragraph which has appeared in the daily papers, to the effect that a suggestion has been thrown out that the mountain lands should be sold at twenty cents per acre. On this proposition I can only remark that, unaccompanied by a change in the mode of segregating lots on the lines of railroad, so far as those portions of the public domain and railroad appropriations are concerned, considerable eventual inconvenience would be found to result from the segregated sections possessing so small an area as 640 acres. On this, however, and some other points relating to the utilization of our mountain, swamp and other lands, immigration, irrigation, etc., it would be well for the Legislature not to move hastily, commence legislation, or take prominent action thereon, until all these subjects have been carefully examined into, and their bearings on the public weal, both for the present and future, been deliberately and comprehensively considered.

Pyrenean Sheep.

The delay just noticed has also afforded me an opportunity of reperusing a series of able articles by Mr. James Wilson, which appeared in the first and second volumes of the *Journal of Agriculture*, under the caption of the "Origin of Domestic Animals." In the course of Mr. Wilson's essays, a quotation is given from the writings of the celebrated Arthur Young, which contains a description of the sheep which occupies the Catalonian or eastern end of the Pyrenees, in which it is stated:

"They (the sheep) are always in the open air, never housed or under cover, and never taste of any food but what they can find on the hills. * * * I examined the sheep attentively. They are in general polled, but some have horns. * * * The legs are white or reddish; speckled faces, some white, some reddish; I reckon they would weigh when fat from fifteen to eighteen pounds a quarter; some with a very little tuft on their foreheads. On the whole, they resemble those on the South Downs; their legs are as short as those of that breed—a point which merits observation, as they travel so much and so well. Their shape is very good; round ribs, and flat, straight backs; and would be with us reckoned handsome sheep. In order to be better acquainted with them, I desired one of the shepherds to catch a ram for me to feel. * * * I supposed he would do it with his crook, or probably not be able to do it at all; but he walked into the flock, and, singling out a ram and a goat, bid them follow him, which they did immediately; and he talked to them while they were obeying him, holding out his hand as if to give them something. * * * The weight of the fleece I guessed would weigh eight pounds; but it was said that the average of the flock would be from four to five pounds."

Financial Observations.

In the financial calculations which I gave last week, I feel that, as a whole, they will stand the test of the closest examination, so far as the net balance is concerned; but as regards the feeding capacity of the area under consideration, I believe it is underrated 400 per cent. This circumstance would, however, leave ample room and to spare for simultaneously introducing over the same area the Cashmere goat and Kerry cattle, and still leave the better class of valleys open for the culture of oleaginous and textile plants, like flax, and even the beet-root—the refuse from the dressing and eventual manufacture of which two crops would form admirable winter aids to the pasturage when gathered at that season into the more sheltered positions. These desiderata would at the same time be accompanied by inexpensive water-power, by which the raw materials may be cheaply converted into articles of commercial produce and manufacture—paper amongst the number. These facts I strongly recommend to the serious consideration of the Central Pacific Railroad Company.

THOMAS ROWLANDSON.

The Earth Worm.

This worm, wherever found in abundance and of large size, is an indication of superior soil. The presence of moisture is, however, essential to its existence. No inconsiderable share of the luxuriant, grassy meadows and pastures of the British isles is in consequence of the continuous top-dressing given to these lands by worm-casts. The study of these apparently insignificant creatures is well worthy of attention. An able writer on their habits has observed: "It is not easy to express the pleasure which is excited in the mind of the observer of nature while contemplating the habits and manners of the *Annelida*. Every movement exemplifies the curve of beauty; every tentacle winds ceaselessly and rapidly through a thousand forms of matchless grace. Whether coiling round a visible object, or picking up a microscopic molecule for the construction of the cell, it exhibits a delicacy and precision of aim which the erudite finger of the most skillful artisan never equalled. The refined perfection of its muscular performance is matched only by its exquisite sensibility. Like the human hand, of which the manifold endowments have exhausted the admiring eloquence of philosophers and theologians, it unites in its little self the most varied capacities. It is at once an eye, an ear, a nose and a finger—it sees, it hears, it smells, it touches!"

Shelter Your Animals.—All animals, especially cows in milk, require warm shelter from rains as well as snow. A great amount of loss is incurred, even in the warmer valleys of this State, for lack of shelter for stock during the winter months. Such loss is not confined to the accident of death alone; but animals so exposed suffer great detriment, and often permanent constitutional injury. It may be said that lumber is too scarce and high in most places to allow such shelter; but a contriving or humane man, if he finds the cost of lumber too great to make such improvements pecuniarily profitable, will seek other material for the purpose. There is scarce a ranch in the State where either tules or coarse grass may not be obtained in sufficient quantities to furnish an abundant and sufficient protection to stock from the cold and pelting rain. We will endeavor, at an early day, to give some illustrated hint in this direction which may prove both interesting and profitable to our farmers and ranch men, and also further the humane objects of the "Society for Prevention of Cruelty to Animals."

Shipping Wheat in Bulk.—The Solano *Democrat* says that it costs $6.37½ more to ship a ton of wheat from San Francisco in sacks than from Vallejo in bulk. How does the *Democrat* know that such is the fact, seeing that no grain has yet been shipped "in bulk" from either locality? When ships can be found prepared to *receive* grain in bulk, elevators will be found in San Francisco as well as in Vallejo to load them. Shipments in bulk will prove of great advantage to California, as a State, whenever it can be made practical.

Improved Stock.—The Los Angeles *News* notes approvingly the fact that the breeders of horses and mules in that section of the State, or some of them, at least, are turning their attention to improving their breed of animals. It costs little, if any more, to rear a band of good horses than one of mustangs, and when reared, the breeder has something to repay him for his trouble. The day for slab sided hogs, long-horned cattle and mustang horses has gone by.

Singular Wool.—William H. Murray, of Pittsfield, Mass., a wool dealer, recently received a fleece of wool from Ohio, the staple of which is about one inch and a half in length, and of two distinct colors. The outer half inch is white, the second or middle black, and the third or innermost white again; and just at this point, where the wool was sheared from the sheep, another section of black was beginning to appear. The divisions of color are as distinct as if art instead of nature had done the coloring.

Oakland and its Surroundings.

[Written for the Scientific Press.]

Oakland, the city of schools and fine residences; of trees, gardens and homesteads, is steadily growing in wealth and business importance. Although real estate reached its present valuation eighteen months since, it is still constantly finding purchasers who are making homes. Within the circles of business, lots are high, but in active demand. Several new blocks are occupied by elegant stores, and others are about to be erected. In one, the foundation of which has just been laid, every room is already rented. Capitalists here insist that Oakland is to be the great metropolis of the Pacific coast; that it presents a dozen miles of wharfage, while its natural position and advantages are unequaled. Engineers have already determined its levels and grades, and proposed a system of sewerage that will be efficient. Oaklanders look upon San Francisco as a confusion of badly-graded streets, filthy sinks, and blocks of abortive designs. In its present stage of rusty growth, it would cost more to convert it into a well constructed city than it would to build a magnificent emporium at Oakland, where every natural advantage lays open to the enterprise.

Lumber Yards and Mills.

In the present season of hard times, the material interests here are not far different from most other places in the State. Money is scarce, business dull, and a heavy drag. The five lumber yards along the city front are well supplied, and are all doing more or less business. The Oakland Point Planing Mills have recently added another story to their building. It now employs 12 men, and is well supplied with machinery for all sorts of planing or ornamental finishing. More machinery has been ordered—enough to double the capacity of the mill.

The Pioneer Planing Mills, usually employing 25 to 30 men, are working but 12 at present. The upper story, occupied by stair building, employs six men. The Oakland Planing Mill—one of the finest in the State, with a working capacity of 30 men, has been idle over a month.

The Three Flouring Mills

Are all idle, with a liberal supply of flour on hand for immediate sales. A change in the market rates of wheat and flour is looked for. The principal sales of flour at these mills are to the local trade. Some low-grade flour is shipped to China, but the profits are small.

A Hint to Wheat Growers.

In looking through these mills I noticed much difference in the construction of the cleaning apparatus. The great difficulty of cleaning all sorts of dirty wheat is admitted, and many imperfections appear to exist in the machinery now in use. The thorough cleansing of wheat at the mill is expensive, and the farmer is a great loser by sending so much dirty wheat to market. He should use more care in selecting seed free from barley, oats, etc. He should also clear out some of the weeds from his field, and clean his wheat at home, saving extra freight. He will thereby be sure to utilize the refuse for his stock, and get the advantage of a good price.

The Use of Lime in Cleansing Smutty Wheat,

Mentioned in the Scientific Press, has been in use 30 years, and was patented in 1855, by a man named Campbell. One of the millers informed me that he had mixed wheat flour with smutty wheat, and that it absorbed the smut, leaving the wheat, after fanning, perfectly clean.

The Oakland Cotton Factory.

Stepping into the Oakland Cotton Factory, I found about 60 hands employed manufacturing grain sacks from jute. No cotton goods are manufactured here—the cotton having been replaced by the best flax machinery, obtained from England and Scotland. Not being able to procure flax at a moderate cost, the proprietors now use jute—a long, but perishable fiber, obtained from the East Indies, at a net cost of about five cents per pound. Flax would make better sacks, but the company could not afford to pay more for it than for the jute, as the sacks sell for the same price.

Flax and its Cultivation.

But it is claimed that at four cents per pound it will pay to cultivate flax. The seed is a paying crop, yet some 250 tons of seed was imported by the Oil Company at San Francisco, the past season! About one-third of the weight of flax straw is fiber. With an efficient economical machine for breaking—one that can be attached to and worked by a common horse-power—why would it not be profitable to produce flax for market?

It does not require the best quality of flax for sacks. The straw, after producing a crop of seed, would furnish a good fiber for such use. The break machine used in the Oakland mill cost $350. It has a capacity of about one ton a day, and could be run by a common horse-power.

With a capacity of 2,000 yards per day, this mill now turns out but 1,500, each yard making a sack. The sewing is all done by hand. Ten girls are employed spinning and weaving; 37 Chinamen are also employed. The foreman informed me that "the preference for China labor consists in the fact that Chinamen are steady, tractable, and constant hands." If white men and women had no individuality, no wants nor rights, and no higher ambition than to serve labor till they could get money to leave the country with, many capitalists might find comfort.

The San Antonio Pottery.

I also visited the San Antonio Pottery, where the curious clay is molded into many forms. This establishment has been in active operation since 1856. Here was manufactured the first stone ware, fire brick, and terra cotta ever made on this coast.

A great number of flower pots, and all sorts of brown earthenware, are here manufactured. The proprietor has improved machinery—some of his own invention—for working the material, and he employs experienced workmen from Sweden. The clay, which is of a very superior quality, is obtained at Michigan Bar, in Amador county, at a net cost of $10 per ton. He is very sanguine that he is making fire brick superior in quality to any imported article, and he says that his capacity for producing such brick is unlimited. As a substantial fire brick is largely demanded on this coast, it is to be hoped that this enterprise may prove a success.

The San Antonio Tannery.

This business was started in 1865, and the proprietor informed me that until recently he has tanned and dressed all kinds of leather; but at the present time, only sole-leather is manufactured here. There are thirty vats in use, which, with three men, turn out about 400 sides per month. Twice that number were employed, when different kinds of leather were manufactured. The principal market for this leather is found East. Why do we send our leather East and import boots and shoes?

The bark here employed for tanning, which is of very superior quality, is obtained from the *chestnut oak*, found along the coast. Its cost is $16 per cord. A steam engine furnishes power for grinding the bark, rolling the leather, etc. The hides are obtained near at hand, and only fresh ones are purchased, which, tanned with oak bark, make very superior leather. The prices obtained equal that of the best Eastern leather.

Formerly, hides imported from the Sandwich Islands were tanned here; but such hides are so rotten and inferior that none are now used. It has been found to be the most profitable to cure only the beef.

The W. P. Railroad.

One cannot but notice the progress and thoroughness of the work now being done along the W. P. Railroad at the Point and beyond Oakland. Five pile-drivers are now employed, and two others are being built. This looks like business ahead. The railroad company have but to build a system of wharves along the water front now owned by them, to insure the building up of a large city at Oakland, which would also comprise Alameda and Brooklyn. A hundred projecting wharves, well dredged between, will only be what nature has made practicable.

The steamer Oakland, lying at San Antonio, has a rail track firmly laid through its entire length, and is apparently in readiness to convey the first overland freight train that will land in San Francisco.

Miscellaneous.

While "sloshing round" through the rain and mud of the past few days, I saw many things interesting, the mention of which would make this letter too long.

At the Averill Chemical Paint Works I admired the many beautiful colors, and the strength and finish of their work. The genius of invention is rife in Oakland, and more than one mind is asserting the power of principles over matter in utilizing material things.

I have been highly entertained by Mr. A. F. Potter, who has for the past eight years devoted much attention to the art and science of gunnery. He has already patented an improvement in projectiles for smooth-bore guns, which I think must eventually do away with the rifle. He is now finishing his model of a new method for raising and depressing light and heavy artillery, whereby the "gage" is obtained much quicker than by the old method, and with mathematical precision. H.

Converting Dwarfs into Standards.

Dwarf pear trees may be converted into standards, at will, after they come to bearing, by cutting notches in the pear wood above the quince stock. These notches should be cut at equal distances all about the tree, in order that the pear stock may send out roots in all directions. After the notches are cut, haul the earth about the tree so as to completely cover them. The juncture of the quince and pear should always be below the surface of the ground; but if it is desirable to make standards of them at once, the juncture should be five or six inches below the surface. The trees should be allowed to come to bearing and produce fruit before the change is made.

The advantages claimed from the conversions of dwarfs into standards is early bearing and long life. It is also said that fruit of some varieties is thus produced of better size and quality. This is said to be the case especially with the Duchesse d' Angouleme. One writer claims that this variety of the pear, grown on trees in his nursery, started as standards, had never equalled that of the same variety grown on trees converted from dwarfs to standards.

Agricultural Products of Salinas Valley.—The shipment of farm produce from Castroville Landing, Monterey county, during the past year, show the richness of Salinas valley. Moss & Beadle's books show nearly seven million pounds of wheat, nearly six million pounds of barley, nearly half a million pounds of peas, beans, oats and mustard seed; more than half a million pounds of potatoes; besides thirty to forty thousand pounds of lentils and flax seed. Then there were over 135,000 pounds of butter, over 44,000 pounds of cheese, and 26 boxes of eggs. Such is the record of one company's warehouse.

Milk Pans.—There has been much discussion with regard to the use of zinc for milk pans, instead of tin. The general impression is, that it should not be employed for such purpose. Probably the best material obtainable would be glass.

Notices to Correspondents.

URBAN, Sacramento.—Sea-sickness, it has been stated, may be avoided by acting as follows: "Let a person on a ship that is rolling, take a tumbler of water nearly full, at the same time endeavoring to prevent the liquid from being spilled by maintaining its surface horizontal, or nearly so. In accomplishing this, it will be found that the hand and arm will be drawn into various positions. In making the necessary efforts, the party must allow the hand, arm and body to assist the motions required, as is seen with persons in the act of sawing, planing, pumping, throwing a quoit, etc. It is said that by so doing the giddiness and nausea occasioned by the rolling of sea-going vessels is prevented, which is apt to produce on some persons. By so acting after nausea has commenced, relief, it is said, will be obtained.

"NATOMA."—We were not aware that the days did lengthen at night with no change in the morning. The times given in the common almanacs are mostly approximations merely. The variable length of twilight at the same place in different seasons is owing to the varying declination of the sun, and the consequent difference of time required to sink the distance below the horizon where the reflection is lost, as his course is more or less vertical.

H. S.—The Colfax strawberry, about which you inquire, and which was illustrated in the last issue of the PRESS, may be obtained at the "Palmyra Fruit Nurseries," Purdy & Johnston, proprietors, Palmyra, Wayne county, N. Y. Price, $2 per dozen, or $10 per 100 (currency). The plants will be sent postpaid, if so desired. Fifty plants, or any number over, will be sent at the 100 rates; six plants will be sent for $1. We think it has never been introduced into this State.

K. O., Nev.—The PRESS will be sent to you. The specimens sent contain apparently molybdate of lead (Wulfenite) and gray copper ore. They have been carefully assayed by Messrs. Hanka & Falksnau, of the Pacific Chemical Works, who give the following result: Gold, a trace; silver, 163.33 oz. troy, or $211.17 to the ton of 2,000 lbs.

"J. O. S.," Georgetown, Col.—We know of no other books in the English language than the one you mention. Several German and French works, as Kerl's or Rivot's metallurgy, contain articles on the subject.

"E. N. S.," Placerville.—Your communication will be noticed next week.

"J. G."—Your communication will be noticed next week.

Legislative.

Among the bills introduced or acted upon in the State Legislature of late, the following are of general interest to our readers:

In the Assembly, a resolution has been offered, constituting the Committee on Public Lands and the Committee on Agriculture a Committee on Immigration, to report a bill to the House to secure immigration; also a bill was offered to prevent forage and field conflagration; one to encourage the destruction of gophers and squirrels in Alameda and Contra Costa counties, and to provide for a bounty for the same; and one to encourage the production and manufacture of beet sugar.

In the Senate, Mr. Perkins introduced a bill amending the law regulating the sale of swamp and overflowed lands, for the avowed purpose of making actual settlers upon such lands preferred purchasers. Many men who have settled upon such in good faith, supposing them to be ordinary government lands, are surprised to find efforts made to secure titles to their farms, under purchases from the State, by parties who claim them as swamp and overflowed lands.

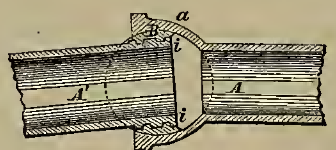
Senator Betge introduced a bill to create the office of Inspector of Beeves, Swine and other Animals for the San Francisco Market. It is founded on the necessity of reform in the matter of feeding, keeping and killing cattle, etc. We hear that a petition for the appointment of a Meat Inspector has been extensively signed by leading physicians in this city. But according to the Senator's bill, the Inspector and appendages will cost the State at least $7,360 yearly,—a larger sum, we think, than is at all necessary. Again, the cattle must be brought hither and kept, according to the bill, at least six weeks before being slaughtered, which would cause a very heavy expense for the cattle merchants.

Mr. Farley introduced a bill in relation to the inspection of steam boilers: The Governor to appoint within 30 days a Chio Inspector, with power to appoint a deputy for each Congressional District. We are in favor of having such an Inspector, if the proper man can be found. We think, however, that some of the points of Mr. Farley's bill ought to be revised. In the first place, no one who has an active interest in boiler-making should be allowed to be appointed. No man can fairly test his own work, and the State should in no way favor one person to the detriment of others, as would certainly be the result in this case. We are inclined to think, moreover, that the Inspector should be paid a certain sum for each inspection, and that by the State. This would make his pay depend on the amount of work done. In the country districts, perhaps, a small annual salary might be paid in addition, where the distances to be traveled over are large, and the number of inspections to be made are small. The income should be large enough to secure competent men, who should be made independent of the boiler-makers on the one hand, while on the other the opportunities of extortion should be made as limited as possible. The manner of making the tests might also be left to the Inspector, whose term of office should be during good behavior.

SANBORN'S STEAM FIRE-PROOF SAFE.—By the peculiar construction of this safe, which causes the generation of steam between the double walls when exposed to fire, it is claimed that the desideratum of a really *fire-proof* safe has been attained. As far as we have heard, the experiments seem to have resulted with the best of success. One of the trunk safes was submitted to a fire test, at a private trial for sixteen hours, and its capacity for endurance was still not exhausted. The report of a public trial may be found in the SCIENTIFIC PRESS under date of Nov. 6th, 1869.

A Neat Joint for Pipes.

Mr. J. F. Ward, of New York, has recently been laying iron pipe under the Harlem river from Manhattan Island to Ward's Island, a distance of about 850 feet, under a contract with the Croton Aqueduct Department. The pipes are united by means of a very simple and neat ball and socket joint, which we find described in the *Scientific American*.



One end of the pipe, A, is provided with a concave flange, *a*, which receives the corresponding end of the pipe, A′. This end is furnished with annular ribs, *i*. The space between the end and the flange is packed with lead, B, and the joint is thus rendered perfectly secure, while at the same time it is also flexible. As no screw bolts are required, it is an economical piece of work, and appears to us to be a very neat contrivance.

The eight-inch pipe used in this work is cast in lengths of eight feet. The method of laying it is novel and simple. A large open boat was used, in which was carried a supply of pipes and melted lead. At the stern of the boat was placed a small frame for supporting the pipes. These were jointed together in the boat, and, as fast as completed, were pushed out over the stern into the water. Thus was formed a flexible string of pipes, which sank and rested upon the river bottom as the boat progressed. In this way the work was easily and speedily accomplished. The depth of the water in the river where the pipe lies is about forty feet.

A NEW AND CHEAP PROCESS FOR PRESERVING WOOD.—A correspondent of the *American Artisan* writes from Galveston, Texas, in reference to Foreman's Process: "Both the Kyanizing and Burnetizing Processes require machinery to inject the solution into the pores of timber; and, besides, they are greatly more expensive than Foreman's process. The latter consists of inserting into the wood a powder, filled with auger-holes, bored at intervals of three or four feet. This powder has the capacity to attract sufficient moisture to dissolve it and penetrate all the pores of the wood, where it takes the crystalline form, so mineralizing the wood as to act as a preservative against rot, worms, and, measurably, against fire. The writer has specimens of wood, the most ready to decay—such as cottonwood, elm, poplar, linden, and others—that have been several years in the ground as posts, and in the most exposed situations, that are sound and fresh, the bark itself still adhering to the wood, the sap solid, and, like the heart and bark, showing the mineral crystals throughout. The active minerals used are chloride of mercury and arsenic, well known antiseptics, and the auxiliaries are such as command confidence whenever named to men of science."

THE OVERLAND MONTHLY for February has been received. The articles which give us the most food for thought and reflection are: "Our Ishmaelites," a rather one-sided, but still very strong article on the Red Man, which critices with cutting force the present Indian policy or want of policy; "Australia;" "A Flock of Wool," which concerns our wool-growing interests; "Western Agricultural Improvements," a most readable article; and "Concerning Popular Assassinations," which handles in a sarcastic manner the murders of the stamp of the Richardson-McFarland affair. Justice is done to the memory of our pioneer naturalist—how many have heard of him?—A. J. Grayson, who deserves a place among our greatest, in the "Story of an Ornithologist." The other articles are of the average quality.

Silk Manufacture in Los Angeles.

We were much gratified yesterday at witnessing the progress which has been made by the Messrs. Neumann, at their factory on Commercial street in this city, in manufacturing silk. These gentlemen, after years of struggle, have their factory well under way, employing some sixteen or eighteen hands. All the various processes of ruling, doubling, twisting, weaving and dyeing are here carried on. They have now, as the first article of their manufacture, a magnificent American silk flag, 36 by 20 feet in size, nearly completed—the stars have already been placed in position upon their ground of blue, and the stripes have nearly all been added. Every part of the flag, including the cords, tassels and binding, is of California production, and has been made at this factory. Its companion is also nearly ready for being put together. As has already been announced, one of these flags is to be raised over our State Capitol, while the other goes to Washington. The proprietors are also engaged upon several specimens of dress goods, which, when completed, will have an appropriate natural bestowment. This establishment, it is claimed, now includes everything necessary for the production of a quality of silk, which will be equal to any which can be manufactured at Lyons or elsewhere; and where the visitor can witness every stage of the process, from the unwinding of the cocoons to the weaving and coloring of the goods. The Pioneer Silk Factory of California may now be said to be fairly and practically under way.

Electricity in Surgery.

Among the new ideas which have been lately broached is that of an ingenious Frenchman, a M. Trouvé, of Paris, who has within the past month brought to the notice of the French Institute a novel instrument for probing gunshot-wounds. His bullet-probe consists of a needle with two points, each of which is connected by means of a wire with a small electric battery and with a bell. The idea is, that in probing a wound to discover the position of a ball, as soon as the two points of the needle are both brought in contact with a piece of metal, this will be denoted by the electrical current which immediately is set in motion, and which will then ring the bell. The idea is certainly very ingenious, and, if practical, will be a valuable help to the surgeon.

Another idea which has been brought forward by another Frenchman, a M. Melsen, likewise noticed at a meeting of the same Institute, is to extract fragments of iron or steel from wounds by means of a powerful magnet. This seems, however, not nearly as plausible as the preceding. It is often very difficult to ascertain the position of a ball, or even to find out whether it is still in a body. M. Trouvé makes the ball itself take, as it were, an active part in discovering itself.

NORTHERN LIGHTS.—There was a brilliant display of the aurora in the heavens above Portland on the 3d inst. Over forty degrees of the horizon were covered, and rays of light went up in converging lines, so that the whole northern hemisphere was splendidly illuminated with red, yellow, orange and purple tints. The light continued from 1½ to 3 o'clock in the morning.

LEATHER MANUFACTURE.—The Pacific Tannery at Stockton is said to have manufactured 200,000 sides of leather last year, employing continually thirty men and consuming over 800 cords of tan bark. At Los Angeles, Hyman & Co. have a tannery of 100 vats, according to the San Bernardino *Guardian*, and employ a large number of men to cut and gather the bark and supply the hides.

A Full List of Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending January 18th.

Enclosed Folding Spring Bed.—Louis Derome, San Francisco, Cal.

Oar.—Wm. J. Hough, Martinez, Cal.

Strike for Locks.—Wm. Weisner, Elizabeth, New Mexico Territory, assignor to himself and Claudius Keifer.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than any other agency.

* * *

Out of Employ.

We see crowds of men on our streets loafing about seeking for work. There is a loud complaint of nothing to do. The city is requested to make work that these men may find employment and be able to support themselves. And because the great majority find nothing, there is raised the cry of dull times.

In strange contrast with this, we find the papers of various places on the coast calling for men to do the work which is required to be done there. It is said that 25,000 are still needed in Montana. The *Inland Empire* says that Nevada can offer employment to a still greater number, and can give them higher wages. Other reports in other places tend to the same purpose.

Horace Greeley some time ago "came out" upon the class, which clings about New York City in the same way, as degrading and dishonoring labor. We can do no better than to quote him:

"Why, you wouldn't have city-bred mechanics dig ditches and make road-beds, would you?" Yes; we would have every one do the most acceptable work he (or she) can find. We would have any man shovel earth for a dollar per day, where such work is wanted, rather than earn five dollars per day by the lightest and most elegant employment which was given him to keep him out of the Alms House. We complain of these men who stay where they are not wanted and whine for employment, that they degrade and dishonor labor. They make employment a charity, when it should be a fair exchange of equivalents to the advantage of both parties. They have no moral right thus to shine and shame those who are trying to walk erect, and, though poor, meet their richer neighbors on a footing of manly self-respect. Labor is noble and ennobling. No man should be ashamed of honest work, however coarse and rugged; any man should be ashamed to confess himself an idler. But when an employer gives out work, not because he wants it done, but because his *employee* must have it or famish, the former becomes a benefactor, the latter a cringing dependent, and equality between them is impossible.

* * *

A Subscription and Query.

New San Diego, Cal., Jan. 20.

Messrs. Dewey & Co.:—Having at last decided upon this as my place of residence, I wish to renew my subscription for the monthly Scientific Press; for who would be without it? as I often meet with *one article* in its columns well worth the subscription price. And what is $4 to a mechanic? Only one day's wages. Inclosed find your money, and send it on (beginning with January number).

Please inform me, by letter, whether there are any American family knitting machines in your city, or other knitting machine; and you will much oblige your constant patron, Jacob Gregg.

[We publish the above that any agencies for knitting machines may make a note of it, and answer Mr. Gregg's query.—Eds. Press.]

* * *

Not Gone.—The report copied into this paper from one of the city dailies, that David E. Buel had gone to Europe with the view of interesting foreign capitalists into another Reese River mining enterprise, is contradicted. The Reese River *Reveille* says he is still at Eureka, "working like a major."

New Books.

Agricultural Qualitative and Quantitative Chemical Analysis; After E. Wolfe, Fresenius, Krocker and others. Edited by G. C. Caldwell, Professor of Agricultural Chemistry in the Cornell University. Published by Orange Judd & Co., New York.

The purpose of this work is to supply a complete manual of chemical analysis for the use, especially, of agricultural students. The processes of analysis that are described refer only to such substances as are found in soils, plants, animals, fertilizers, or other materials or products of agriculture. In order to reduce the size and, at the same time, the price of the book as much as possible, the editor has confined himself to those methods of analysis which are most commonly used by chemists, and such as have been tried and found reliable, with such improvements as have been introduced into more recent practice.

The chapters on special analysis have been compiled from the very best authorities extant—mostly German. The scheme of qualitative analysis is one which the editor has employed with the University classes under his especial charge. The first chapter contains a list of all the reagents employed in pursuing the various courses of analysis described in the work, full directions being given for the preparation of many of them—especially such as cannot be speedily procured of druggists. The proper chemical tests are also given, whereby analists may determine the purity and the strength of the solutions to be made, when necessary.

The various manipulations to be employed are given in a full and distinct manner, so that any person acquainted with the leading principles of chemistry may readily follow them out in his own laboratory. The book, though designed more particularly as a text-book for the laboratory, will also be found of value both to the proficient and to the amateur in agricultural chemistry. A series of valuable tables have been appended, including one of eight pages, giving the composition of a large number of agricultural materials and products, in 100 parts of the substance. The book comprises over 300 pages, and is furnished by A. Roman & Co. for $1.75—a price very low for a work of this kind.

Specimens of Fancy Turning executed on the Hand and Foot Lathe; with Geometric, Oval, and Eccentric Chucks, and Elliptical Cutting Frame. Illustrated by thirty exquisite photographs. Philadelphia: Henry Carey Baird. For sale by A. Roman & Co., San Francisco. Price, $3.

The object of this exceedingly handsome publication is to show the powers of the lathe, and to stimulate others to carry on more completely and systematically similar illustrations. The photographs are excellent, and show most varied and beautiful designs. Their effect is really wonderful in several instances. The figures were cut on a lathe by a delicately-pointed tool, kept in position by guides, and pressed at the back by a fine spiral spring, which tool can be drawn back at any moment by the turner. The process is exceedingly simple. A highly-enamelled card is covered with India ink by a flat camel's hair brush; the card is then fastened to the face of a chuck, and the spring tool allowed to cut through the blackened surface of the card, exposing to view the white paper which was originally employed in making the card. The specimens are photographic copies of the originals, executed on a scale one-third larger than the originals. We heartily recommend the book to amateurs; and would state, moreover, that it makes a handsome ornament for any parlor table.

The Golden Dawn and Other Stories. By May Wentworth. Illustrated. 12mo. pp. 220. New York: Published by A. Roman & Co. 1870. Price $1.

Children have a literature of their own in these latter days, and many are the gems which sparkle for the benefit and pleasure of the little ones. A very pretty little gem with a very pretty facing, is this book, which will bring light and dimpling smiles to the faces of little readers.

* * *

Wines in and for California—The *Bulletin* says that four wine cellars in San Francisco now contain 675,000 gallons of California wine, and a fifth has 80,000 bottles of sparkling wines. Six months ago 40,000 cases of foreign champagne arrived in San Francisco within seventy days, and the wine merchants compute that $2,000,000 have been expended on the Pacific coast in the purchase of foreign wines within the year.

Our Home Industries.

Tea Culture in California.

The *Morning Call* published an article some time ago with regard to the Japanese colony in El Dorado county, where Japanese are engaged in the tea culture. We sent the article to Herr Schnell, the manager of the experimental farm, for corrections and additions, and have received it back with a few alterations, which we incorporate into the following article:

The Japanese Colony.

At Gold Hill, El Dorado county, is the settlement generally known as the Japanese colony. The enterprise is a private speculation of Herr Schnell's, who owns the land, and for its cultivation hires the Japanese, paying them monthly wages, under contracts made in Japan. He has now seven women and twenty-one men in his employ. Buildings are now being erected for their better accommodation. There are to be twelve of these built in regular Japanese fashion, with low, pitched roofs, the eaves extending far over the sills and forming a balcony or awning around the entire house. The outer walls and partitions are all of sliding panels, which can be shut together at the corners and folded into boxes, leaving nothing but the roof and its supports during the hot summer days. The partition walls are of paper, the outer walls of wood. Not a nail is used—all the joints and timbers being dove-tailed together by many ingenious devices; and the whole work, even to the rafters, is as smooth as if it had been polished down with sandpaper. The carpenters are Japanese.

The Tea Plant.

The Manager

And proprietor is Mr. J. Henry Schnell, commonly called Herr Schnell. This gentleman, formerly in the Prussian marine service, resided some twelve years in Japan, and may be supposed to be thoroughly conversant with his business. From the experiments which he has made, he is convinced that the problem of tea culture in California is solved, and that there is no longer any doubt but that as good teas can be raised here as are produced in Japan.

The Tea Plant.

Only one species of tea plant is known, and this is the one designated by Dr. von Siebold as the *Sinensis Linn.* All of the varieties described by botanists are but variations of this, produced by different modes of cultivation and geographical distribution. The plant is indigenous in China and Japan. It is an evergreen, from four to six feet high, with numerous irregular branches; growing wild, however, it reaches the height of fifteen or twenty feet. The stem is straight, of a bright gray color, the branches chestnut, and the wood hard, and with a peculiar odor. The leaves are elliptical or lanceolate, obtusely serrated, alternate, and placed on short foot-stalks. The color is a bright green, of different shades, deepening as the season advances. Between the leaves sprout the blossoms, which are at first of a rose color; but in the course of their development assume lighter shades, and, finally, when full blown, are of the color of the ordinary tea-rose. They are without odor and very tender, but are put to no use. Often two or three grow together on separate peduncles, and placed at the axilla of the leaves. The calix is small, smooth, persistent, and divided into five segments. The filaments are numerous, short, and inserted at the base of the corolla. The anthers are large and yellow. The style bi—or trifid; the capsule, two or (generally) three-celled, with two or three oblong brown seeds. Owing to the great quantity of oil in these seeds, they are difficult to preserve, and easily decay.

Planting.

All of the new plants at Mr. Schnell's plantation are raised from seeds, which are planted in rows, in furrows from four to six inches deep; a large number, however, decay on account of the excessive amount of oil which they contain. The shrub is easily cultivated, and will flourish nearly everywhere between 35° to 40° north latitude, with plenty of air and sun, but shady places are not profitable to its growth. It is generally thought that it thrives best on the sides of mountains and in light, stony ground. Mr. Schnell has about 120 acres of good agricultural land ready for planting, and about 400 acres of rough land, which he proposes to clear as soon as he can bring it into requisition. This plant will require no irrigation.

The proper time for tea planting is in November or December, and the shrub sprouts through the ground in about thirty days. By the ensuing May, the plant reaches the height of about fourteen inches, when the perfect and tender leaves are stripped off and placed under immediate manipulation. Every year the shrubs are trimmed down to a height of about three feet, after having reached that height, and when properly cared for, will produce good crops for upwards of seven years, when they are cut down to the ground to let the new sprouts come up.

Preparing the Leaf.

The leaves are first put in a large iron pan and roasted; then put in baskets and shaken and swung in the wind until the moisture, which has been exuded by the heat, has been thoroughly dried; they are then roasted again, rolled in the palms of the hand, to separate the leaves and prevent their crumbling into powder; then dried again in the baskets by shaking and swinging, and then put into jars, when they are ready for the market. The black teas are roasted three times, the green teas but once or twice. The Chinese do not use their tea until it is about a year old, considering that it is too actively narcotic when new.

It is said that the quality of the tea depends to a considerable extent on the time of plucking the leaves. Thus the Chinese never gather the leaves on a rainy day unless obliged to; for certain varieties, the leaves must be collected in the morning of a sunny day, etc., etc. Mr. Schnell says that it is necessary that the plants should have the morning sun and be planted on the south side of a hill, or the leaves will become yellow, and the tea be of an inferior quality.

Cultivation in the United States.

Some ten or a dozen years ago, the Agricultural Department of the U. S. Patent office distributed a large number of plants throughout the country. No result seems to have followed, however, further, perhaps, than a few experiments, which seemed to show that its cultivation was possible. A Mr. Campbell, residing near Knoxville, Tenn., is said to have raised enough for his family for several years, and considers the tea fully equal to some of the best qualities of the imported kinds. If he was fully satisfied, however, it might be expected that he would undertake the cultivation on a large scale. The prices of labor may have deterred him. To Mr. Schnell we must give the credit of first really introducing the tea culture as a business in our country. His success will affect us all greatly; and if he proves, as he thinks he can, that we can raise our own tea, he will be a real benefactor to the country. In regard to the labor in preparing the leaf, it is said that this may be done to a great extent by machinery.

The Diet of Students.

Dr. George M. Beard, in the course of some papers upon Hygiene for Students, gives one upon diet. We give a few paragraphs from the Yale *Courant*, which has it entire: "I cannot expect any to understand what I am to say, who does not comprehend the fact that for every mental act however slight, there is a corresponding waste of tissue in the brain. This waste must be supplied by food.

The diet of students should be generous and palatable. It has been recently estimated that a few hours of mental labor causes more important waste of tissue than a whole day of muscular labor. We certainly know by experience that a few hours of mental labor is more exhausting than a whole day of muscular labor to those who are accustomed to such toil. No literary man can spend as many hours at his work as the day laborer. * * I know that it is possible to study hard, for a limited season, on a spare diet. There are students in our colleges, who, from necessity, or, more likely, from mistaken notions of hygiene, restrict themselves to a meager and unsatisfying allowance. With all such the evil result is a question of time. * * I write in memory of the time when the teachings of the late Dr. Alcott, one of the most deluded and deluding writers that ever enlisted in the service of Hygiene—whose amazing absurdities were only matched by the ignorant sincerity and misguided industry with which they were advocated—exerted a strong influence in many of our seats of learning. I write in memory of the time when the celebrated work of President Hitchcock—'*Dyspepsia Forestalled and Resisted*,' one of the most unfortunate books on Hygiene that ever proceeded from the pen of man—was the law and the gospel on the subject of diet to a large number of inquiring minds in our academies, colleges and theological seminaries. * * It is a sad fact that those who were most led astray by these pernicious heresies were men of the purest ambition and ripest culture—men who in other departments of thought were sensible and well-informed. If they had been even moderately well taught in the true philosophy of diet, they would readily have seen the theoretical folly and practical absurdity of the views for which they so stoutly contended, and in defense of which some of them laid down their lives."

◆

Scabby Sheep.—A bill is pending in the Legislature to impose severe penalties upon the owners of sheep affected with scab who may carelessly or wilfully allow them to stray on the highways or ranges of other sheep owners, and thus expose sound sheep to the contagion of the disease.

◆

The oldest piano in the United States is owned by M. C. Loomis, of New Haven. The case is four and a quarter feet long, by one and a quarter wide, and on it is this inscription: "Gabriel Bumcbari et Zuimpe, Londoni, 1786. Prince street, Hanover Square,"

I. O. O. F.

THE NEW AGE,

A Weekly Journal of Sixteen Pages.

The "Official Organ" of the I. O. O. F. on the Pacific Coast.

Is devoted to Odd Fellowship, the Arts and Sciences and General Literature; and as a family paper is not surpassed by any journal in the United States. Subscription price per year by mail, $6. Delivered in the city, per month, 60 cents. Office, Odd Fellows' Hall, 327 Montgomery street, San Francisco. 19v19

The large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of Dewey & Co., publishers of the Scientific Press. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

HIBBERD, SANBORN. & CO.,

STAIR BUILDERS.

South Point Mills, Berry Street,
Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins. Fancy Newels and Balusters.

Advertise Rightly and You will Surely Profit by it.

The Scientific Press is the best and cheapest advertising medium in the Pacific States

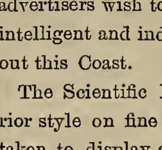
For advertising Mining and Farming Inventions, Machinery and Implements, Tools for Workshops, and all Industrial Pursuits on the Coast, and in fact, all matters which advertisers wish to have known to the most intelligent and industrial classes throughout this Coast.

The Scientific Press is printed in superior style on fine paper, and great care is taken to display advertisements conspicuously and in good taste.

A large edition of the Press is bound in Monthly Parts (pamphlet form) and also a large edition in Quarterly Series (stiff binding); which are furnished to hotels, libraries, reading rooms, ferry boats, bay, river and ocean steamers, R. R. depots, etc., throughout the Pacific Coast. Our advertising columns are the best patronized of any weekly paper west of the Rocky Mountains. Our advertisements are longer continued than those of any other paper. As to the value of the Scientific Press as an advertising medium, we refer to our list of patrons. No paper in the world has a better class of intelligent, reliable customers.

DEWEY & CO.,
Publishers and Patent Agents, 414 Clay street.

Blake's Patent.



The best PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's

Patent Steam PUMP

It is simple, compact and powerful, needs no expert to run it, and will start at any point. Is warranted positive under all circumstances. Send for a circular.

BERRY & PLACE, 112 and 114 California st., San Francisco.

To all who may wish to obtain a thorough knowledge of the industrial resources of the Pacific Coast, the Press will be found a valuable paper.—*Oakland Transcript.*

TEN DOLLARS EACH,
FULL PAID STOCK.

OFFICERS OF THE COMPANY.

President	SAMUEL MERRITT.
Vice-President	MICHAEL REESE.
Treasurer	J. SELIGMAN & CO.
Secretary and General Agent	W. K. VAN ALEN.

Board of Trustees—Samuel Merritt, Michael Reese, Abraham Seligman, John B. Felton, Joseph Aron, Wm. H. Sharp, Henry Barroilhet.

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, seven miles in length by four thousand feet in width, embracing five thousand and twenty acres.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of all mines discovered by the Tunnel.

4th—A royalty forever of two dollars on each and every ton of ore extracted from any part of the Comstock Lode, and

5th—The right of appropriation of all the water carried off through the Tunnel.

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, and be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to all parts of the mines, and through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make available many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt as to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, as has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwall, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata and Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots and mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very important revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Company two dollars per ton, forever, on every ton of ore extracted from any portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of this great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, and confidence in, all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coast,

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

Advertising and Subscription

Rates for the Scientific Press.

SUBSCRIPTIONS IN ADVANCE :—One year, $4; six months, $2.50; single copies, 10 cents; Monthly Series, $4.50 per annum; Quarterly Series (stiff paper binding) $5.

Lowest Rates for Advertising:

We shall adhere to the following rates (payable in gold coin) for advertising in the SCIENTIFIC PRESS from this date:

	1 *week.*	1 *month.*	3 *months.*	1 *year.*
One sq. (10 lines agate).	$1 50	$ 3 00	$ 8 00	$ 32 00
Two squares.........	3 00	6 00	15 00	60 00
Three squares........	4 50	9 00	20 00	76 00
One-fourth column...	6 00	12 00	28 00	100 00
Half column..........	12 00	20 00	54 00	200 00
One column..........	20 00	40 00	100 00	400 00

RATES BY THE LINE.

Per line.—One week, 25 cents; one month, 80 cents; three months, $2; one year, $5.

Per line, ten lines or more.—One week, 20 cents; one month, 30 cents; three months, 80 cents; one year, $3.20.

MINING AND LEGAL ADVERTISEMENTS will be inserted at special rates—less than one-half the cost of daily publication.

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form. We will otherwise assist advertisers in getting up their notices, when desired.

☞ All advertisements in the PRESS appear in both the
☞the MONTHLY AND QUARTERLY SERIES of the SCIEN-
☞TIFIC PRESS, which (by special arrangement) are
☞placed for FREE READING in the principal hotels,
☞steamboat and steamship saloons, depots, and pub-
☞lic reading rooms and libraries in San Francisco and
☞Pacific States. Many volumes are also bound, thus
☞affording permanent advertising.

The PRESS now receives the largest and best advertising patronage of ANY WEEKLY PAPER west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—*our advertisers*. Better referees, or more reliable names, cannot be found in the advertising columns of any newspaper in the world.

The Aerial Steam Navigation Company.

At a meeting of the stockholders of this company, December 17th, 1869, Messrs. Eugene Sullivan, Thomas N. Cazneau, Henry F. Williams and Simon L. Jones were appointed a committee to receive subscriptions for one thousand shares (one-tenth of the capital stock of the company) at the rate of ten dollars per share of the par value of one hundred dollars. said shares to be *unassessable*. The funds thus raised are to be devoted exclusively to the construction of the first aerial steam carriage, and to be deposited in the Bank of British Columbia, to be disbursed upon requisition of Mr George K. Gluyas, Engineer of Construction. The working, drawings, etc, can be seen at the office of Gen Thomas N. Cazneau, No. 321 California street. where subscriptions will be received. No invention for navigating the air has before received such positive indorsements from engineers of reputation, or so liberal encouragement from prominent capitalists' as Marriott's Avitor, which now seems sure of being thoroughly tested on a large scale. 2v20-my

Metallurgy.

Metallurgical.

The undersigned respectfully announce to the public (especially to parties interested in mining) that they have opened an office at

No. 36 FREMONT STREET,
And WORKS at H. J. BOOTH & CO'S FOUNDRY, northeast corner First and Mission streets, San Francisco, where Ores in small or large quantities of all kinds can be worked by Pan Amalgamation, Chlorination or Smelting, and all kinds of Assays and Analyses made. We will also sample any Ores entrusted to our care; and in all cases returns made in the shortest time possible. We will give consultations on the best methods of successfully working Sulphurets or Refractory Ore.

Drawings Furnished for Quartz Mills, Smelting and Chlorination Furnaces.

By having had long practical experience in working Gold, Silver, Copper and Lead Ores, we hope thereby to get a share of the patronage of the mining public.
☞ Mines Examined and Reports made.

LIST OF CONTENTS.

Æolipile.
Balance, Compensation; Barometer; Blower, Fan; Brake, Friction.
Cams; Capstans; Centrolinead; Clutches; Chasers; Clamps, bench and screw; Cock, four-way; Column, oscillating; Compasses, proportion; Counters of revolutions; Coupling, union; Crank—substitute for the, variable; Cranks, bell and compound; Cyclograph.
Differential Movements; Drag-link; Drill—Fiddle and Persian; Drills, Cramp; Drop; Drum and Rope; Driver, Pile; Dynamometers.
Eccentrics; Ejectors, Bilge; Ellipsograph. Engine, Disk; Engines—Rotary, Steam, Valve Gear for; Epicyclic Trains; Escapements.
Fountain, Hiero's: Fusees.
Gasometers; Gauge, Bisecting; Gauges, Pressure; Gear, Steering; Gearing—Bevel, Brush, Capstan, Conical, Crown, Eccentric, Elliptical, Face, Friction, Internal, Irregular, Multiple, Mutilated, Scroll, Sector, Spur, Step, Stud, Sun and Planet; Gearing—Variable, Worm; Governors; Guides; Gyroscope.
Hammers—Atmospheric, Bell, Compressed Air, Trip, Steam; Helicograph; Hook—Boat-detaching, Releasing; Hooks, Centrifugal Check; Hyperbolas, Instrument for Drawing.
Intermittent Movements.
Jack—Hydrostatic, Lifting; Joint—Ball and Socket, Bayonet, Universal.
Ladder—Folding, Self-Adjusting; Lazy-tongs; Level, Self-recording; Lever—Bell-crank or Elbow, Knee; Lewis; Link. Detachable Chain.
Machine—Bohnenberger's, Drilling, Polishing, Punching, Warp-dressing; Main, Flexible Water; Maintaining Power; Meter—Gas (wet and dry), Water; Mill—Barker's, Crushing, Tread, Wind; Miscellaneous Movements; Motion—Alternating Traverse, Rocking, Self-reversing, Shuttle; Motions—Feed, Link, Parallel, Pump, Traverse, Variable Traverse.
Pantograph; Parabolas, Instrument for Drawing; Paradox, Mechanical; Pendulum, Conical; Pendulums, Compensation; Pinion—Lantern, Mutilated, Slotted, Two-toothed; Power, Horse; Presses, Hydrostatic; Propeller, Screw; Pulley—Expanding, Friction; Pulleys—Anti-friction Bearing for, Chain; Pump—Air, Balance, Bellows, Chain, Diaphragm, Steam-siphon; Pumps—Double-acting, Force, Lift, Rotary; Punching Machine.
Rack—Mangle, Mutilated; Racks and Pinions; Ram, Montgolfier's Water; Ratchets and Pawls; Regulator—Gas, Watch, Reversing Motion, Self; Revolver; Rollers, Oblique; Rolls—Anti-friction, Drawing, Feed; Rulers, Parallel.
Saw—Endless Band, Gig, Pendulum; Screw, Archimedes, Differential, Double Reversed, Micrometer; Screws—Endless, Right-and-left Hand; Sectors; See-saw; Shears; Stamps; Stand, Mirror; Stop—for Hoisting Apparatus, for Lantern Wheels, for Ratchet Wheels, for Spur Gear; Stops for Winding Watches.
Test, Friction; Throttle, Spinning; Toggle-joint; Tongs, Lifting; Trap, Steam; Treadles.
Water, Machines for Raising: Weir, Self-acting; Wheel Cam, Lantern, Persian, Pin, Rag, Sprocket, Steering, Waved; Wheels—Crown, Mangle, Paddle, Water; Windlass—Chinese, Friction; Windmills; Wipers.

This book is bound in cloth, and embraces 122 pages. The illustrations are plain, and each figure is clearly described on the page opposite to it. It is a low-priced book for its kind, and there are few persons who have to do with machinery, or are interested in understanding the science and principles of motion, who will not be benefitted and satisfied by its purchase.

A liberal discount made to the trade. Single copies, $1—sent postage free. Address orders,

DEWEY & CO.,
Patent Agents, San Francisco.

Reading for the Hour.

Ignorance About California.

A couple of photographers in New Orleans have written to us a very solicitous letter, the same as the one published in the S. F. *Bulletin*, requesting information about California in general, and concerning the photographic business in particular. They want to know if we are far enough along in the path of civilization to have any photographers here, and, suspecting, perhaps, that we may have a few rude attempts in this business, send us a couple of "tintotypes," one marked "$1 each," the other, "3 for $1," such as are worth here not over twenty-five cents apiece. We had thought that the productions, of some of our artists were known everywhere in the United States; it would seem, however, that they have not reached New Orleans. At any rate, we advise our young friends to stay where they are, if they can sell their pictures at their prices. Being still young, if they are willing to work at what they may find to do, perhaps even to learn something from our community, and to lay aside all expectations of growing suddenly rich at the expense of us simple Californians, they may succeed here. But with their present prices and apparent expectations, they will hardly answer for our State or city.

Lost—A Mining Company.—We have received one or two letters from Eastern stockholders, earnestly requesting information with regard to the People's G. and S. M. Co., of Sierra county. We have made various inquiries in the city, but have been unable to obtain any information. Those persons who may possess any knowledge on the subject are respectfully requested to write us, giving any facts as to whether any such concern exists or has existed, and, if deceased, to add the particulars, that we may prepare a fitting obituary. We ask for a speedy reply, in order that we may not commit ourselves by any too hasty remarks. The desired information may also be sent to S. H. Cheeseman, Becket, Berkshire county, Mass.

A Princely Reprobate.—It is said that the Grand Duke of Mecklenburg-Schwerin has been leading such a wild life, that the King of Prussia has addressed a letter to him, urging him to put an end to this scandalous domestic life, and, above all things, no longer to maltreat his wife, whom the Duke is said to whip brutally at times. This advice is good, and, coming from the source it does, the Duke may find it best to heed it. It is rather rich, however, to see such a rake as the Prussian King is, addressing moral advice to a younger reprobate.

An Ice Mountain in Virginia.—It is said that there exists in Hampshire county, West Virginia, a mountain about 500 feet high, the west side of which, from base to summit, is covered with small loose stones. By removing these stones to the depth of a few feet, solid ice is found in the warmest days of summer. This phenomena is similar to that connected with the "frozen well" in Brandon, Vt., and the reported locality on the plains, where it is said ice may be found at all times during the summer, just below the roots of the green gaass.

Singular Phenomenon.—A curious phenomenon, according to the Boston *Advertiser*, is frequently seen in the harbor of Machiasport, Me., which consists of an upheaval, by some unknown power, of vast quantities of water, mud and stones, to the distance of many feet, and with a furious rushing noise. This phenomenon has occured quite a number of times during the past summer.

Pumping Money.

The air pump has been used for many purposes, but few are aware that it is employed in the process of making money. Such, however, is the fact with regard to the mint of Great Britain, and since the year 1810 all coins which have come from this mint have been pumped into existence, the finishing touches which give them their impressions and their milled edges being always administered through the medium of the air-pump. London *Engineering* gives some very interesting details of the process.

The prime mover is a steam engine of twenty horse-power, on the combined high and low-pressure principle. The air-pump consists of a cast iron cylinder, externally similar to that of an ordinary steam engine, but internally very different. The piston is solid, but surrounded by rings of cast iron, pressed outward, so as to fit the cylinder, by the action of steel rings. The pump is 42 inches in diameter, and the piston has a stroke of 36 inches. The base and the cover of the cylinder are iron boxes, each containing 64 small valves, which are narrow strips of saw plate, each covering an aperture and screwed at one end to the seat. In each box 32 of these valves open to the atmosphere, and 32 to the exhaust tubes. By this arrangement, the pump, which is worked directly from the main beam of the engine, is made double-acting.

A pipe, running over the roof of the building, connects the air-pump with a vacuum chamber in the coining room. This chamber is a cylinder of cast iron, 50 feet long and 30 inches in diameter, which rests on the floor in a line parallel to the eight coining presses. Along its top, each supported by a pipe opening into it, are ranged eight small cylinders without covers. These are placed vertically, and are furnished with pistons packed with leather. Rods, cranks and levers, of light construction, connect the piston with the central screws of the stamping presses.

Now, when the great air-pump is in action and the valves below the piston are made to open the vacuum chamber, the air within these cylinders rushes down to the exhausted pipe, and is discharged into the atmosphere, while, consequently, the pistons descend and drag after them the main screws or strikers of the presses. The instant that the dies—one of which is attached to each screw—advance towards those resting below them, disks of gold are interposed by self-acting machinery, and inclosed by milled collars of hardened steel. By the force of impact, resulting from the pistons falling in vacuum, as described, the blanks sustain heavy blows from the upper dies, and thus the impressions are made. The steel collars form molds, which indent the edges of the coins and preserve their circularity while being struck. The press screws then rebound, carrying up their respective pistons. The pneumatic valves again open and the dies descend upon fresh blanks. Another batch of sovereigns is pumped into existence, and so long as the air-pump is exhausting the chamber and fresh blanks are forthcoming, streams of coins, glittering like beetles' wings in the sunshine, will flow down from the presses into reservoirs arranged to intercept and make them prisoners. Thus it is that from day to day, during a gold coinage, the operation of creating sovereigns is carried on at the mint, and thus the air-pump has caused a hundred million of them, weighing in the aggregate more than a thousand tons, to be added to the currency of the world. "Pumping sovereigns by wholesale" would, therefore, be by no means an inappropriate title for the present article.

Motion Necessary to Life.—The celebrated Dr. Gregory, in the course of one of his medical lectures at Edinburg, stated: "One cannot stand perfectly motionless for half an hour; that he had once tried to do so, and had fainted at the end of twenty minutes, the blood requiring the aid of motion from the body in order to retain its full circulating power."

French Tobacco Manufacture.

Government Monopoly.

It was in the year 1811, under the reign of Napoleon, that the French government took the monopoly of tobacco. Previous to that date, the French smokers, possessing but moderate means, had fared as ill as those of England and the United States do this day. But one night, at a ball at the Tuilleries, the Emperor noticed a lady who was covered with diamonds. He asked his chamberlain who she was. On being told that her husband was a tobacco merchant who had made a colossal fortune in a few years, he at once suspected that a fortune built up so rapidly could have no very honest foundation. Ten months afterwards he signed, in his usual arbitrary way, a decree, which secured to the State the exclusive right of fabricating and selling tobacco. The monopoly has been renewed since, every ten years, by legislative bodies.

Number of Factories, Officials, Etc.

The number of the imperial manufactories is seventeen. Five hundred and twenty-four officers are entrusted with the management of the plantations, and the charge of the manufactories. There are thirty-one store-houses, three hundred and fifty-seven wholesale warehouses, and 38,831 retail establishments.

A director-general, responsible to the Minister of Finance, is placed at the head of the administration, and all the inferior posts of superintendence are filled by officers selected from the *Ecole Polytechnique;* which means, that they are men of honor and unquestionable capacity. The tobacconist, too, is an official. The post is in the direct gift of the government, and is tenable only during good behavior. He or she (for many of the holders are women) generally owes the appointment to the recommendation of the Receiver-General of the district: the applicant is obliged to petition the Minister of Finance.

Kinds of Tobacco Made.

Three kinds of tobacco are sold to pipe-smokers. The best goes by the name of "Maryland." It is retailed in yellow packets, at $1.25 a pound. The second quality has been baptised "Caporal." It is that most used, and costs a dollar a pound. The third quality is much cheaper, but is prepared for the use of the soldiers solely.

Six or seven kinds of cigars are manufactured. The best cost from 10 to 20 cents apiece. The large majority of Frenchmen know but five kinds of cigars. They are none of them bad, and all are far superior to anything that can be had elsewhere for the money.

The Two Principal Factories

Are in Paris; at the Gros-Caillon, where snuff and pipe-tobacco are made; and at Reuilly, where the higher class of cigars are manufactured. The task is entrusted, in the latter establishment, entirely to women, of whom there are as many as 250 employed. Not the least curious circumstance which strikes a visitor at the manufactory at Reuilly is the total silence observed by the two hundred and fifty workers. A whisper is punished by a fine, and work is paid for by the piece.

Quality of the Tobacco, Etc.

The government has every interest to see that what it sells should be of good quality, that the demand may be general, and that no suspicion of trickery or adulteration may arise in the public mind. Hence a very strict supervision is exercised over the manufacture. Every year introduces some improvement into the system of preparation. Some scores of scientific men are continually employed—they are paid to do it, and to do nothing else—in studying new methods of ameliorating the culture of tobacco, improving the flavor of the leaves, and so blending the different varieties as to form finer and more wholesome cigars. But it is in the making of snuff that the French have attained rare perfection. The time required to turn a leaf of tobacco into snuff, according to the government method, is four years and two months—a fact which speaks volumes for the care and pains bestowed upon the fabrication.

From July 1st, 1811, to Dec. 31st, 1867, the gross receipts of the government tobacco establishment were nearly 1,280 millions of dollars; the expenses were about 400 millions, the net profits about 900 millions.—*All the Year Round.*

Can't Telescope.—The Carson *Appeal* says passengers on the railroad between that place and Virginia City have no fears of the cars "telescoping" in case of colission. The road is too crooked.

Hints and Recipes.

Cure for In-growing Nails.—A correspondent of a medical journal gives the following account of treatment, by which he cured a case of in-growing nails:

"I put a very small piece of tallow in a spoon, and heated it over a lamp until it became very hot, and dropped two or three drops between the nail and granulations. The effect was almost magical. Pain and tenderness were at once relieved, and in a few days the granulations were all gone, the diseased parts dry and destitute of feeling, and the edge of the nail exposed so as to admit of being pared away without inconvenience. The cure was complete, and the trouble never returned. I have tried this plan repeatedly since, and with the most satisfactory results. The operation causes but little if any pain, if the tallow is properly heated. A repetition might in some cause be necessary, although I never met with a case that did not yield to one application."

Wind in the Stomach.—A physician, in a very sensible article upon bathing, says: "For the 'wind in the stomach' children are thought to have for their tiresome crying, and for the restlessness and worrying at night with which they are afflicted, if the warm bath were resorted to oftener, and the dosings of soothing syrups and worse nostrums less, it would be far better for the children."

To Avoid the Ague.—The first suggestion, of course, is to leave those districts where this troublesome complaint prevails. Sometimes, however, one's residence cannot well be changed. To persons so circumstanced, there are preventions by the use of which the majority might generally escape it, which are referred in the *Journal of Health* as follows:

1. Avoid exposing themselves to the malarial air after sunset and before sunrise. 2. Occupy rooms at night on the sunny side of the house and up stairs. 3. Build a fire in the house as soon as the dew begins to fall. The heat of the fire will do much to kill the malaria. 4. Keep the skin healthy and active by a thorough bath every day on rising, in a warm room, with sufficient friction to produce a healthy reaction. 5. Keep the bowels open by a proper diet. In nine cases out of ten the cause of ague would be easily overcome if the depurating organs were not overtaxed and morbid matters allowed to accumulate in the system to oppress it.

How Corks are Made.

Cork, which is the bark of a tree, is received at the factory in the form of slabs, a few feet in length, some of which are over two inches thick and a foot or more wide. The slabs are sliced up into square pieces by a circular knife hung exactly like a circular saw. This circular blade is ground to a thin, sharp edge, which will cut up slabs of cork, without removing a kerf, faster than a saw will cut plank into pieces of equal size. The square pieces are then held by the hands of boys in a kind of lathe, in such a position that the sharp and thin end of a hollow mandrel will cut out a perfectly round cork in an instant. Mandrels of various sizes are employed to cut cork of the desired size. Each cork is then placed by little fingers, in corresponding recesses, in a feed-wheel of an automatic machine, where the corks are tapered by the removal of a thin shaving from the periphery of one end. The shaving is removed by the sharp edge of a circular cutter over two feet in diameter, which revolves horizontally. The edge of every instrument that cuts cork is brought in contact with the material to be cut with a very *drawing* stroke, as such spongy material could not be cut satisfactorily by a *crushing* stroke. Thick slabs of cork are cut into large corks, while the thin ones are worked into corks of a corresponding size.

History of Opera.—The opera originated in Italy. Thence it found its way all over Europe, being at first exclusively performed for the amusement of royal courts. Cardinal Mazarin was its patron, and introduced it into France, and Handel first put it on the English stage. Christopher Gluck, a Bohemian, born in 1714, is to be credited with having brought opera to perfection. In 1762 he produced *Orpheus* at Vienna, and *Alceste* in 1766, both his own creations. He established French opera in Paris, while Handel did the same in England. Picini was Gluck's great opponent and stoutly upheld Italian opera against Gluck's French productions. The works of Picini are forgotten, but those of Gluck still live.—*Prof. Ritter.*

TREATMENT OF REBELLIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24v18-4w

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

Office, No. 520 Montgomery street, over Sather's Bank, San Francisco, Cal. jan8

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is $25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

Following is the list of Government fees, payable in currency:

On every caveat	$10
On every application for a patent, for seventeen years	15
On every application for a design, for 3 y'rs and 6 mos	10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

Inventors having models in our possession must send written orders when they desire any particular friend to see them.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Our Office.

The office of the MINING AND SCIENTIFIC PRESS is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room counting room, and news paper printing office — all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number —414 Clay street, below Sansome.

TO THE WORKING CLASS.—We are now prepared to furnish all classes with constant employment at home, the whole of the time or for the spare moments. Business new, light and profitable. Persons of either sex easily earn from 50c. to $5 per evening, and a proportional sum by devoting their whole time to the business. Boys and girls earn nearly as much as men. That all who see this notice may send their address and test the business, we make this unparalleled offer: To such as are not well satisfied, we will send $1 to pay for the trouble of writing. Full particulars, a valuable sample, which will do to commence work on, and a copy of *The People's Literary Companion*—one of the largest and best family newspapers published—all sent free by mail. Reader, if you want permanent, profitable work, address E. C. ALLEN & CO., Augusta, Maine. 5v20-3m

MARAVILLA COCOA.—*For Breakfast.*—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

The Scientific Press,

Devoted to SCIENTIFIC AND MECHANICAL PROGRESS, MINING, FARMING AND MECHANIC ARTS, contains more VALUABLE READING MATTER than any other weekly journal west of the Rocky Mountains. It is the best printed and only finely-illustrated paper on the Coast. Its articles are able, timely and reliable, and written in a more interesting and easily comprehensive style than scientific papers in general. Now in its twentieth volume, it is printed on superior paper, containing sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe. All our best citizens are interested in the new discoveries in the development and progress of the three great industrial pursuits named above, which are closely allied on this coast, and are jointly represented in the PRESS, rendering it a popular and influential journal with all industrial readers. Subscriptions reduced to $4 a year, Jan. 1, 1870.

To Inventors on the Pacific Coast.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

ENGRAVING ON WOOD, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

Dear Doctor:—I feel much pleasure to inform you that your "Emerald Hair Balm" has caused the growth of hair on my head—having only used one of your bottles, although I had been bald for twenty-five years. You are quite at liberty to use this intimation as you please. Yours truly, John Stapleton,

California street, San Francisco.

To W. J. Crowly, M. D., No. 20 Montgomery street, San Francisco. 23v19-3m

---

Important to Californians.

The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods cheaply, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

The plant has no enemies; mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $25 per hundred; 20 per cent. off to the trade. Address,

HENRY HUGHES & J. S. SILVER,
1v20-1m 302 Battery street, San Francisco.

Ayer's
Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,

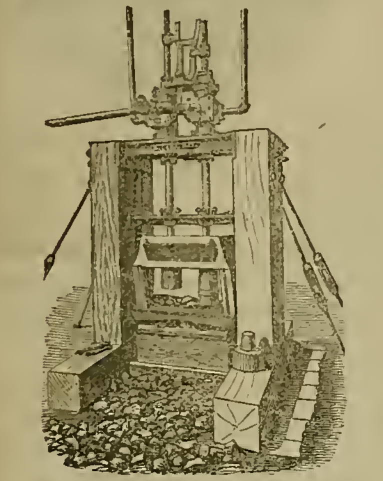
Machinery.

THE WILSON

Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELE, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

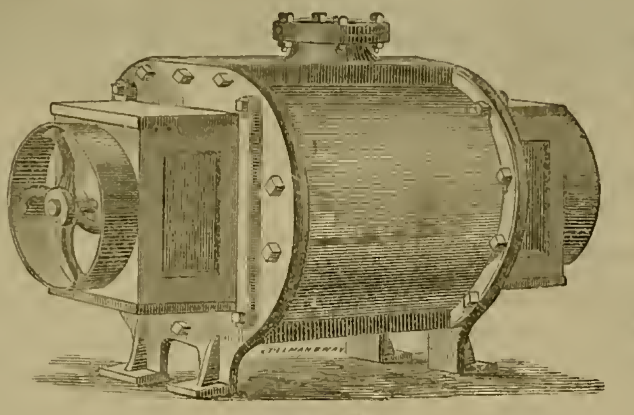
ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

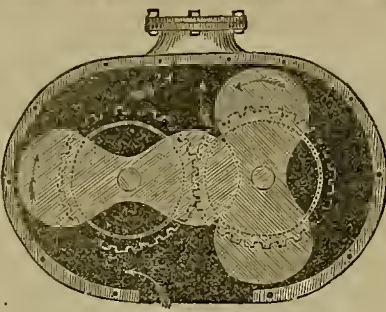
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont street,

1v1 San Francisco.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

CAUTION AGAINST FRAUD.

Declared by Connoisseurs to be the only good Sauce The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for Lea & Perrins' Sauce, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may he infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c,; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-1yeow

IN THE PROBATE COURT OF THE CITY AND County of San Francisco, State of California.

In the matter of the Estate of ABRAHAM CREEMER MESSERVE, deceased.

On reading and filing the petition of Benjamin Shellard, Administrator of the estate of Abraham Creemer Messervo, deceased, setting forth that he has filed an account of his administration upon said Estate in this Court, and that the same has been duly heard, allowed, and confirmed; that more than ten months have elapsed since the publication of notice to creditors, and that no claims against the said deceased have been presented to said Administrator, and the Estate is in a condition to be closed, and that the real property remains to be distributed among the heirs of said deceased; and praying, among other things, for an order of distribution of said real property among the persons entitled,

It is ordered, That all persons interested in the Estate of Abraham Creemer Messerve, deceased, be and appear before the Probate Court of the City and County of San Francisco, at the Court Room of said Court, in the City Hall, in said City and County of San Francisco, on the seventh day of February, A. D. 1870, at eleven o'clock in the forenoon of that day, then and there to show cause why an order of distribution should not be made of the real property of said Estate among the heirs of said deceased according to law.

It is further ordered, That a copy of this order he published at least for four successive weeks before the said seventh day of February, A. D. 1870, in the Scientific Press, a newspaper printed and published in said City and County of San Francisco.

SELDEN S. WRIGHT, Probate Judge.
San Francisco January 5th, A. D. 1870. jan8-4w

Creditable Opinions.

The following editorial notices come from very creditable sources:

THE MINING AND SCIENTIFIC PRESS.—The name of this able and excellent journal has been abbreviated. Henceforth it will be known as the Scientific Press, leaving off for convenience the word Mining. In changing the name, the publishers wish it distinctly understood that their advocacy of mining shall not be abated, and that no change will be made in other leading departments of the paper, which will continue as usual to represent the leading interests of the Pacific coast -Mining, Farming and the Mechanic Arts. The terms of the Press have been reduced to $4 per annum, and every miner should subscribe for it.—*Humboldt Register, Jan.* 8.

WE have received a call from Mr. S. H. Herring, traveling agent for the Scientific Press, who is now canvassing for that journal in Oakland and vicinity. The Press is a finely illustrated weekly paper of sixteen pages, devoted to scientific and mechanical progress on this coast—embracing mining, farming and mechanic arts; subjects of living interest to all industrial readers. It meets the wants and deserves the patronage of working and thinking men. It is issued every Saturday by Dewey & Co., publishers and patent agents, 414 Clay street, San Francisco. Subscription price, $4 per annum.—*Oakland News.*

THE old favorite mining paper, the Mining and Scientific Press, of San Francisco, comes to us this week with a new head, and with some new features introduced. It is now called the Scientific Press, and while the proprietors still intend to devote as much space as formerly to mining, mechanic arts, etc., they will add a department devoted to agriculture. The Press has just entered on its twentieth volume, and is one of the oldest as well as the best and most reliable mining papers published in the United States, and perhaps in the world.—*Colorado (Central City) Register, Jan.* 13.

SCIENTIFIC PRESS.—The Mining and Scientific Press, which has been a faithful exponent of the scientific, mechanical and industrial interests of our western coast, entered upon its twentieth volume on the first of January, and at the same time adopted the shorter and equally comprehensive title of Scientific Press. This journal has, for some time past, maintained a department specially devoted to agricultural matters, and has filled it with useful and interesting information.—*Contra Costa Gazette, Jan.*, 1870.

SCIENTIFIC PRESS.—This paper, indispensable to every mine and mining man on the Pacific coast, closes volume nineteen with the number now before us. The proprietors have reduced the price to four dollars per year, and say: "Profited by the experience of the past, and encouraged with liberal patronage, we shall add improvements which will render the next volume of the Press much superior to its former issues.—*Alpine Miner.*

SCIENTIFIC PRESS.—The S. F. Mining Press has entered upon its twentieth volume with a change of name—Scientific Press. This is a journal devoted mainly to the interests of the miner, farmer and mechanic, and has well sustained its position in all respects. The price has been reduced to $4 per year, and we cannot too highly recommend it to all classes.—*Alpine Chronicle.*

LOOK OUT FOR HIM.—Sam. Heidelberger, sole agent in Idaho for Mark Twain's Innocents Abroad and the Scientific Press of San Francisco, left yesterday for Ada and Boise counties, where he will make a thorough canvass of Boise City and valley, as well as the Basin, for these popular publications. He will also act as agent for the *Tidal Wave.—Wave, Jan.* 13.

SCIENTIFIC PRESS.—This valuable paper commenced the new year with volume twenty. The title is changed to Scientific Press. The paper is devoted to mining, farming and mechanic arts—the three great leading interests of the Pacific coast. The Press is ably conducted by Dewey & Co., and we recommend it as almost invaluable to persons engaged in the above pursuits.—*Placer Herald, Jan.* 13.

SCIENTIFIC PRESS.—This paper, devoted to the interests of the miners, farmers and mechanics, has just entered its twentieth volume and donned a new head, and also a slight alteration in name. It is a good substantial sheet of sixteen pages, beautifully printed and illustrated. As a journal of scientific and industrial progress, we would recommend it to all. Dewey & Co., San Francisco. Subscription, $4 per year.—*Yolo Mail.*

SCIENTIFIC PRESS.—The title of the Mining and Scientific Press, published by Dewey & Co., has been changed to the Scientific Press. This is one of the most valuable of our exchanges, and we are pleased to notice the great improvements made in it the past year. On the 1st of January it began a new volume, entering upon its tenth year.—*San Bernardino Guardian.*

THE Mining and Scientific Press, published at San Francisco, California, by Dewey & Co., is a handsome illustrated sixteen-page weekly, and one of the most valuable and interesting exchanges that comes to our table. Subscription price, $4 per year.—*Inventors' and Mechanics' Journal.*

NEW VOLUME.—The Scientific Press has commenced a new volume. It has been greatly improved in many ways. It is now a fine journal for the farming community as well as the miner.—*Pajaronian.*

SCIENTIFIC PRESS.—Dewey & Co. are the publishers of this sterling paper It is devoted to the dissemination of mining, farming and scientific knowledge, besides containing miscellany of interest.—*Monterey Republican.*

◆

THE BEST SAFE.—One of the most important inventions in this age of discoveries to the business community is, undoubtedly, Sanborn's Steam Fire-Proof Safe. Repeated severe tests have established its superiority over all the safes with which it has been brought in contact. The elegant designs and beautiful ornamentation of these safes render them an acquisition to any well-furnished apartment, while their perfect fire-proof quality make them a necessity to every business man. The recent severe tests in this city are still remembered. We clip the following from the Philadelphia *Transcript:*

A REAL SALAMANDER AT LAST.—Not the least interesting feature of the great Inter-safe Fair at Norristown was the trial of patent safes, which came off under the superintendency of the committee. An immense wood-fire was lighted, and a large number of safes of different makes were placed in it. The fire was kept burning nine hours and a half; and at the end of that time every safe in the flames had its contents totally destroyed, except one, with Sanborn's patent steam improvement. This was taken out, and, to the extreme surprise of the uninitiated, its contents were uninjured. The committee were so much pleased with this demonstration of the fact that there is at last a really fire-proof safe, that a gold medal was awarded the owners.

Ross, Dempster & Co., Nos. 105, 107 and 109 California street, are the sole agents for the Pacific coast. *

SUISUN CITY, Cal., June 26, 1869.

MESSRS. DEWEY & CO:—This is the third time you have presented me with Letters Patent within twelve months. Gentlemen, you have done all I have asked of you—you have been honest; you are men that an inventor can rely upon for doing business for him, and he need not fear of being swindled or wronged in any way. I would give you business to do in your various departments in preference to any one else. Many thanks to you for your success. You have obtained valuable patents for me, and I appreciate your kindness, your honesty, ability and success. Yours, RICHARD KNOTT.

Illustrate your Inventions

IN THE SCIENTIFIC PRESS,

An illustrated journal of Mining, Farming, Mechanic Arts and Industries on the Pacific Coast. It costs no more for a superior engraving by our experienced artists than is usually charged for a less perfect picture. If you wish to introduce a new invention properly before the public, the first steps in so doing are important ones. A full description and correct representation in the PRESS will go further and prove more quickly effective than any other means.

The fact that an illustration is admitted into our columns, guarantees the invention important consideration in the minds of thousands of the most intelligent readers—at home and abroad—who would not notice it so favorably or so thoroughly, if at all, when presented through an unreliable medium or indifferent source.

The model of an invention sent to us is sufficient for making a good engraving, Sometimes a photographic view is sufficient; but it is always best accompanied with drawings or a copy of the patent. A first-class illustration has proved to be one of the best and cheapest means of obtaining purchasers for a good machine or a valuable patent.

Cuts ordered for illustration are the property of the inventor who pays for them, and can generally be used for circulars, pamphlets, books, or other newspapers. The engravings to be seen in each issue of the SCIENTIFIC PRESS are a fair sample of the work of the artists who can always be found in our office.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, Instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apperatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School." New Haven. Conn. 13v6-1v16p

Independent Order of Odd Fellows.

As many of our readers are members of the fraternity of Odd Fellows—an organization which is spread widely among all classes and conditions of life—we think it a matter of sufficient general interest to give some few facts relating to the brotherhood, and, in this connection, give also an illustration of the handsome building owned by the Odd Fellows' Hall Association of San Francisco.

The first regular working Lodge in California was founded in the town of Yerba Buena—*i. e.*, San Francisco—in 1847, and held its meetings in the Portsmouth House, at the northeast corner of Clay and Kearny streets. The gold fever in 1848, however, broke up the Lodge, the members scattering to the mines. The first regularly instituted Lodge was the California, No. 1, founded Sept. 9, 1849; the second was the Sacramento, No. 2, founded in 1851. From this time on the fraternity has rapidly grown and the Lodges have multiplied and spread into the surrounding States and Territories. In 1852, the Chemeketa Lodge was instituted at Salem, Oregon; in 1855, Washington Territory founded its first—the Olympia, No. 1—at Olympia, and the first in Nevada was instituted about 1862. The Grand Encampment—a higher branch of Odd Fellowship—was founded in Sacramento, January 8, 1855.

At the present time there are in California 158 working Lodges, with a membership of about 12,000 persons. In San Francisco alone there are 15 Lodges and 3,793 members. The fraternity is in a most healthy and flourishing condition. Its annual revenue in this State amounts to some $300,000; it has invested in property about $450,000, and it pays annually for the relief of members some $12,000. It is estimated that in all, in 1869, $200,000 were expended in giving relief, Sacramento alone spending $36,000 for maintaining the Odd Fellows' Hospital. In the United States it has about 300,000 members, and a surplus capital of $20,000,000; in England, about 450,000 members, and a surplus capital of over $13,000,000. This capital in both countries, then, amounts to the large sum of $33,000,000. All the different branches throughout the world contain over a million of members.

The Odd Fellows' Hall, situated on the corner of Montgomery and Summer streets, was dedicated by the R. W. G. Lodge of California on the sixth day of May, 1863. The rapid increase of the Order and of the subordinate Lodges and Encampments made necessary further accommodations; and in 1866 the lot adjoining, in the rear, fronting on Summer street, was purchased, and an additional building erected. The lot at present is 65x134½ feet, and the total cost, including furniture, etc., was $150,000. The property is held by the Odd Fellows' Hall Association of San Francisco, and at the present time is valued at $250,000.

The basement is rented for storage, and the first or ground floor for stores. On the second floor are ten rooms. Two are occupied by the Odd Fellows' Savings Bank; the others on Montgomery street by the Grand Secretary of the R. W. G. Lodge of California. On Summer street are the office and editorial rooms of the *New Age*, the official paper of the fraternity. Back of these are the chess-room, for the use of members; the reading-room, which is supplied with a large number of daily and weekly newspapers, periodicals and magazines, also a valuable cabinet of curiosities, and which contains the portraits of all the ex-Grand Masters of the State and other portraits and pictures; and the Library, a very tastily-furnished room, containing 19,180 volumes, which, with the cabinet, are valued at $43,500. The remaining rooms on this floor are for committee and other purposes. There are three halls on the third floor and another in the new addition. All of these are very handsomely furnished, the walls are decorated with paintings, portraits and statues, and the ceilings with frescoes. The furniture is very tastily upholstered, rich carpets cover the floors, while Covenant and Wildey Halls contain fine-toned organs. Suitable and convenient ante-rooms are connected with each for the use of the Lodges and Encampments which rent them.

For the illustration and for most of the facts we have given, we are indebted to the *New Age*, which is worthy of the hearty endorsement of the great brotherhood whose interests it supports.

Experiments with a Novel Propeller.

We had the pleasure, a few days ago, of witnessing one of a series of experiments being made with a propeller constructed on a new principle, the chief points of which are the following: The wheel is provided with curved buckets and placed in an iron case. On each side of this case towards the front part of the boat is an aperture for the entrance of water, and at the rear, in the periphery, another for its exit. The wheels are placed amidships, and dip in part only under water. As they revolve, the water is drawn in through the side holes and immediately discharged at the rear (without being carried around). It is claimed that by the use of such a wheel the buckets press against a solid column of water without spraying it, thus utilizing the motive power to a much higher degree than is done by the wheels now in use.

In this experiment, a small 15-horse power engine was placed in a small hull, forty feet long and ten feet wide, which, however, was evidently much too small to carry the whole weight, and, consequently, sank very deep in the water. The tests are made for the purpose of trying the effect of different constructions; and this one was made particularly to find out the best size of the discharging aperture. Enough, however, in general, was shown to convince us that there is considerable power obtained by the new principle, and we hope to give our readers full accounts of the experiments as they are made, whether they prove successful or not. Even under the unfavorable circumstances of a boat too small for the weight carried, and an engine of insufficient power, the distance between the foot of Second street and the Dry-Dock was made in thirty-seven minutes. At several other trials a mile has been run in six minutes by the same boat. The wheel is that patented by Mr. J. C. T. Finlayson, of Oregon, and the experiments are made by Mr. A. C. Loud, an enterprising merchant of this city, who is well known for his contest before the Courts with Senator Cole in regard to another propeller (in which contest the Senator has been already defeated three times), but which is entirely different from the one experimented with. Several other novel and useful devices have been patented by Mr. Loud, who is one of our most active inventors.

Communications.

Sale of Mineral Lands.

[Written for the Scientific Press.]

EDITORS PRESS:—Surveyor-General Bost recommends in his report that the Legislature memorialize Congress to have the mineral, as well as the other public lands of the State, surveyed and opened to preëmption and sale. While many of his suggestions are good, this one, regarding the sale of the mineral lands, is looked upon by the miners as ill-timed. There is in El Dorado county a belt of mineral land some twenty miles in width, from east to west, and running through the county from north to south, which should never be disposed of, so as to exclude *prospecting* and mining for gold, by any one who is willing to embark in that enterprise. Having resided nearly twenty years in this county, and having had practical experience in both mining and agriculture, my opinion is—and I think a majority of the legal voters of the county agree with me—that no further restrictions should be placed on mining than are now imposed by laws and by the decisions of our Courts. When a patent or fee simple is obtained by the agriculturist, he becomes the owner, not only of the soil, but of what is in or under it; hence the miner is excluded from prospecting, or, if he does, and makes valuable discoveries, it must be for the benefit of the owners of the land. One case of the many in this county I will mention. One man has some 1,000 acres fenced with a substantial board fence, and has for the last fifteen years been anxious to obtain a title to it; has wished to exclude prospectors and miners from operating within his inclosure. But miners prospected, found pay, located claims, brought water on the ground, and within the last three years have mined up some ten acres, from which they took $35,000 to $40,000; and this is probably only a part of the good mining ground within his inclosure.

If this individual, with thousands of others, could have obtained a title to this land twelve years ago, millions that have been sent from this country in that time would now be hid in the soil, with no prospect of its being put in circulation. From the best information I can obtain, the amount of gold mined out and put in circulation from this county from 1849 to 1859, was more than $4,000,000 per annum, and from 1859 to 1868, more than $1,700,000 per annum. At the present time it cannot be less than $100,000 per month, and this without being a hindrance, but really a great benefit to the agriculturist, for it gives him cash for his hay, beef, pork, mutton, milk and butter, fruit and vegetables.

Another important question is, if the mineral lands are disposed of, and fall into the hands of agriculturists, which they are quite sure to, what means will be resorted to to keep up the canals and ditches for irrigation? The agriculturists could not do it, it would be too extensive; capitalists would not invest where their money would bring them no returns; miners could not, because they would nót exist to any extent. About eight months of the year the ditches and canals pay owners something above expenses for water used in mining, but the other four months, while most of the water is used for irrigation, according to my experience, they are not remunerative.

Investments in canal property in this county have not been profitable, as your correspondent knows to his sorrow. The abandonment of the canals for mining purposes would give the mining counties to the wandering stock-raiser in the spring, to Digger Indians, grasshoppers and fires in the dry season. Fruit and vegetables must have irrigation in the foothill counties, or they will be small, insipid in taste, and unsaleable. The argument that the sale of the mineral lands would increase the amount of taxes, is not good; for our experience is, that the possessory title and improvements are now assessed at more than the title in fee and improvements would bring under the hammer.

Sargent's bill, now before Congress, in many respects is very good, but, in the opinion of the miners, fails to meet their wants. Supposing under Sargent's bill A, B and C, take up claims above and below me, and I have to purchase the right of way over A's claim to get water to work my ground. B, below me, says, you can not run your *debris* on or over my ground, and C, still lower, says the same thing; now what chance have I with my claim but to be *frozen out* by this little combination of A, B and C, no matter how valuable my claim may be? And have I any protection under that bill? and, if passed, will it not lead to endless litigation? There are plenty of "land sharks," who would control the mouth of every ravine, cañon, gulch or creek, where they could *freeze out* an owner of a good claim, or levy black-mail on him. Had not the title of the bill better be changed so as to read, "A Bill to Fee Lawyers and Officers of Courts?" Miners here hope that no such bill will pass.

If the mineral lands are to be sold, let it so be done that the mineral shall be subject to the prospector and miner on *unimproved* lands, as they are at the present time. To show that the agriculturist is fully protected in his rights, as against miners and all other persons, I give a few extracts from the many decisions made by our Supreme Court. This first quotation shows what the miner's chance would be if the title was complete in the occupant of these mineral lands: "Miners have no right to enter upon private land and subject it to such uses as may be necessary to extract the precious metals which it contains."—Hinshaw *vs.* Clark, 14 Cal., 460.

In the case of Livaroni *vs.* Miller, which went to the Supreme Court from this county, the Court said, that a miner had no right to wash the *debris* from the hill above on to the premises of the plaintiff, thereby materially injuring plaintiff's garden, fruit trees and buildings. In such cases, the right of the defendant to mine in and to use therefor the ravine above plaintiff's premises must be exercised in such a manner as not to damage the prior right of the plaintiff to inhabit and cultivate his premises.

Again: "The miner is liable for the damage to the growing crops caused by his acts, and if the owner of the crops should demand of the miner payment of the damages caused to the crops, and the miner should refuse to pay, a Court of Equity will restrain him from further working."—Rupely *vs.* Welch, 23 Cal., 452.

In the case of Smith *vs.* Doe, 15 Cal., 100, the Court says: "As a general rule, the public mineral lands of the State are open to the occupation of every person, who, in good faith, choose to enter upon them for the purpose of mining. But this rule has its limitation, to be fixed by the facts of each particular case. Certain possessory rights and rights of property in the mining region, though not founded on valid legal title, will be protected against the miner—valuable permanent improvements, such as houses, orchards, vineyards, growing crops," etc. When the agriculturist can sell, mortgage, and dispose of his possessory title, what need is there of more protection than is given in the decisions above quoted?

My last letter, as published, read "the Pacific, etc., paid dividends prior to 1850," which should have been 1859. In regard to "rebellious" ores, mentioned in my last, I have to "go back on it," and say that I was misinformed; for I am told by a practical assayer, who has had much to do with minerals in this county, that there are no rebellious ores here. If rebellious, it is for the want of gold. If I trod on the gentleman's toes in mentioning "rebellious," I hope this will cure the wound.

Placerville, Jan. 21, 1870. E. N. S.

VALUABLE MINES have been discovered within the past year in the Himalayas. There are found silver, lead, antimony, zinc-blende, copper and some gold. One mine at Shigri, on the old boundary of Northern India, is described as an enormous lode, in which the ore is several feet thick, and solid. The others are principally in the country of the Vazeers, or the Vazeeri Rupi as it is generally named in maps.

A LARGE BLACKBERRY BUSH.—The Humboldt *Times* has had a blackberry vine brought to its office in Eureka, that is forty feet in length.

Treating Ores.

[Written for the Scientific Press.]

EDITORS PRESS:—Being a constant reader of your valuable paper, my attention has been attracted by a communication from C. H. A., which appeared in your issue of Dec. 4th, 1869, the reply of J. S., in your issue of the 25th, and the rejoinder of C. H. A. in your last number. A discussion of this kind naturally attracts those who interest themselves in the very vexed points so often occurring in the science of metallurgy. Giving both of those gentlemen credit for acquirements in the science which their communications sufficiently substantiate, it would appear to me that the individual interests of each may, in some way unknown to me, be antagonistic. At any rate, the subject is not sufficiently ventilated, from the fact that both seem to labor under a feeling of dissatisfaction. The manner of the communications it is not my intent further to refer to, but in the matter which C. H. A. refers to, may I be permitted to make a few remarks? [We avail ourselves of this remark, to omit the first objection, which *does* refer rather to the manner than to the matter. —EDS. PRESS.]

C. H. A. makes the broad assertion that he believes "there is not an ore of gold or silver in this country that cannot be worked to a reasonable percentage—say 80 to 90 per cent. of common fire assay—by *some one of the known processes.*" (The italics are mine.) Now I have yet to learn that the "Triunfo ores," of Lower California, have been successfully worked! I do not mean as a chemical success, but as a *remunerative process*, which is the main point in view. The Shaba ore, which your correspondent refers to as being similar to that of the Triunfo, involves, so far as I know, similar difficulties. Can C. H. A. overcome these by any of the known processes so as to leave (if worked here) a margin of profit?

A silver ore containing antimony, which is frequently one of the constituents of the so called refractory ores, at a high temperature forms antimonic acid; this, attacking the silver, produces an insoluble compound (antimoniate of silver). Can C. H. A. evade this difficulty by any of the known processes? or will the electric processes refered to by J. S. remove it? A few facts are wanted to induce the speculation of capitalists to aid experimental science. Such would go further to induce the assistance of thinking men than the gasconading of tyros and humbugs.

To such men as C. H. A. and J. S., we anxiously look for the result of their experience as contributing to the advancement of the mining interests. J. G.

FORMS FOR TELEGRAPHIC MESSAGES.—The British postoffice authorities have prepared, for the use of the public, forms for telegraphic messages, to be used when the whole system of inland telegraphs is acquired by the government. A separate space in lines is allotted to each word, and the corresponding charge is printed clearly on the margin, so that the sender can see at a glance how much he has to pay, and the receiving clerk need be at no trouble in calculating how much he has to charge. Each of the forms thus divided into spaces is prepared for a message of fifty words, which is assumed to be sufficient in the majority of instances. In the right hand upper corner of the page a blank space is left for the stamps, which will probably be almost exclusively used to cover the charges of transmission. Attached to the form are directions for the guidance of the sender, with a tariff of charges, and full information as to the arrangements for porterage.

GALVANIZED WINE.—The story is going round that the house of a vineyard man somewhere in Europe was recently struck by lightning, and that the wine in the cellar thereof was immensely improved in flavor thereby. "This,"—says the story,—"came to the knowledge of General Marey-Monge, who caused a series of experiments to be instituted with various kinds of wine, the result being that a galvanic current applied to the liquid in the casks eminently improves even very inferior kinds."

Items from Boise City, I. T.

[Written for the Scientific Press.]

EDITORS PRESS:—The winter has been a mild one here, but in the mountains the snow is unusually deep and heavy. Miners look forward to a prosperous season.

Around here, a large quantity of mining ground hitherto considered as non-paying, is now being prepared for work, and o some, operations are to begin next week. Placers paying only $4 to $6 per day can now be profitably worked, as provisions and clothing are down to a living price, and there are hundreds of claims in Ada county and on Boise river that can be worked for ten to eleven months in the year that will yield from $3 to $6 a day. The great want in many places is water after the dry season sets in.

Since the fire, contracts have been already made for several fine fire-proof brick buildings, and this, with the work on the penitentiary and Government assay office, shortly to be commenced, will create a demand for brick masons at fair wages.

Real estate is increasing in value and demand in Boise City as business increases.

H. W. O. M.

January 28th, 1870.

THE TRUE SPIRIT OF INVENTION.—Three hundred years ago, when man had just begun to gain control over the forces of nature, and while he was yet fighting against religious intolerance for the bare liberty to *study* them, there was one great mind that soared above his fellows, with the capacity and will to look into the future, and form an appreciative estimate of what was in store for man through the genius of invention, which was then just beginning to make itself felt. Lord Bacon must have had a full understanding of the true spirit of invention, and a just appreciation of the influence which it was to exert on human affairs, when he wrote the following paragraph:

The introduction of new inventions seemeth to be the very chief of all human actions. The benefits of new inventions may extend to all mankind universally, but the good of political achievements can respect but some particular cantons of men; these latter do not endure above a few ages, the former forever. Inventions make all men happy without either injury or damage to any one single person. Furthermore, new inventions are, as it were, new erections and imitations of God's own works.

THE RUBBER TRADE.—There are now in America and Europe more than a hundred and fifty manufactories of india rubber articles, employing from four to five hundred operatives each, and consuming more than ten millions of pounds of gum per annum. The business, too, is considered to be still in its infancy. Certainly it is increasing. Nevertheless, there is no possibility of the demand exceeding the supply. The belt of land around the globe, five hundred miles north and five hundred miles south of the equator, abounds in trees producing the gum; and they can be tapped, it is said, for twenty successive seasons. Forty-three thousand of these trees have been counted in a tract of country thirty miles long and eight wide. Each tree yields an average of three tablespoonfuls of sap daily, but the trees are so close together that one man can gather the sap of eighty in a day.—*North American Review.*

FIRE-PROOF FLOORS AND WALLS.—The following is from the report of the U. S. Commissioner to the Paris Exposition. This mode of building is commended to especial attention: "Lay a floor of seasoned hemlock boards upon the timbers or floor-joists, and then lay a coat of cement, a large proportion of which may be sand, entirely over this floor, from wall to wall, of one inch thick; then let the cement become thoroughly dried, over which lay a floor of matched boards, nailed with 'forty-penny' nails. If there are wood partitions, there should be laid two courses of brick between the studs, and plastered to the base-board, to prevent all circulation of air. A floor laid as above will resist an immense volume of flame in a room for one hour before breaking through the cemented floor above; and the expense of cement is only ten to twelve cents per square yard."

Mechanical Progress.

The Foreman's Business.—We find the following in another of those letters in *Engineering* from "An English Workman in America": "There are hundreds of little secrets in doing work that escape the ordinary workman's observation altogether, which require great practice and perception to discover, and whereby one-half the time in labor may be saved; and it is as an instructor on these points that the thorough efficiency of a foreman is of incalculable advantage. Walking through the works of a large locomotive firm in England, three years ago, I saw several illustrations to the point. There was a pattern maker finishing a pattern for an axle box hexagonal on the bottom; the usual allowance for contraction was correctly made, but the angles on the bottom were straight and true. Now any experienced mechanic could have told him that such a pattern would cast a box hollow on said angles, that is to say, that placing a straight edge lengthways on the angle it would touch on each end, the middle being at least one thirty-second hollow because the casting always shrinks there; the pattern should have been made highest there to allow for this shrinkage. The pattern for the brass was made exactly the same angle as the bottom of the box (a blunder invariably made). In the first place, the shrinkage of the brass in casting alters the angle of the brass; in the second, if it came out of the mold the proper angle it would require a great deal of fitting, because the bottom of the brass would bed as soon as the sides; and a chipping would invariably have to be taken off the bottom, to allow enough to fit the sides; the proper method would have been to make the pattern the exact angle; then *take an eighth of an inch off the bottom*, so that by the time the angles of the brass were fitted, the bottom would come just home. This simple alteration would have not only saved metal and tools, but one-half the time required to fit the brass."

Self-Acting Variable Expansion Gear. The *Engineer* illustrates a novel feature in a portable engine recently exhibited by Robey & Co. at the annual show of the Smithfield Club, and thus describes it: The variable expansion is produced in a very simple and efficient manner by the governor. The governor, placed on the crank shaft, and revolving with it, is of course instantly affected by the slightest difference in the speed. The valve eccentric has a rectangular slot cut parallel to a line connecting its two centers of forward and backward motion. This fits on a square on the crank shaft, upon which it slides at right angles to the crank, being held in position by two wedges. Upon the governor balls expanding these wedges are drawn out, and by this means the travel of the valve is reduced, its cut-off is made earlier, while its lead remains perfectly constant."

Grouping Single Negatives.—In preparing group pictures, photographers have been obliged, when the parties could not all sit at once, to take the portraits singly, then arrange them in one picture, and photograph that. But a photograph of a photograph is not as good as one printed from the original negative. The Yale *Courant* says that Mr. Wiley Kenyon, of Crawfordsville, Ind., has an invention by which he can take any number of single negatives, arrange them artistically into a group, and print the group directly from the original negative.

Hydrostatic Test of Boilers.—*The Locomotive* says there is no doubt that boilers are very often permanently injured by the pressure to which they are subjected in making this test. "Each successive test weakens them, until they fail to longer bear the burden, and rupture, as did one recently at Mobile, while under manipulation by the U. S. Government *Inspector*."

New Submarine Torpedo.—The latest is an infernal machine in the shape of a sword-fish, charged with nitro-glycerine, and propelled at ten knots an hour, and at any desired depth, towards the vessel to be destroyed, by means of mechanism actuated by compressed air. It is described in the *Mechanics' Magazine.*

Ore-Separating Mechanism.—At the meeting of the Polytechnic Association of the American Institute on Dec. 30th, a member described an apparatus devised by him for separating light from heavy sands, based upon the fact that, when sand is poured in a stream upon the apex of a cone, and suffered to flow down its surface, the lighter particles will drop from the lower edge in a nearly vertical direction, while the ore grains, having a much greater specific gravity, and acquiring a much greater velocity in passing downward upon the surface of the cone, will pass from the latter in lines more directly in line with the surface thereof—the two being thus made to diverge in leaving the cone, and consequently being separated.

More Notes for Photographers.—The collodionised plate, on a "dipper" or support, must be passed into the bath with a steady sweep, because any stoppage midway will cause a line to appear where the surface of the liquid crossed the plate at the instant the halt was made. These dippers are commonly made of glass, but when the foot of the dipper projects much in front of the plate, and is let down rapidly into the bath, the liquid plays in little unequal currents against the collodion surface, and causes markings at this part of the plate. Dippers made of silver wire, curved so as to catch the bottom of the plate, are therefore preferable; moreover, they are so light that there is less risk of their breaking the glass bath when the plate is let down too suddenly."

Boiler Pressure Greatest at Bottom. "There has been much difference of opinion among engineers as to whether the pressure in a steam boiler was greatest at the top or bottom. We had the pleasure of seeing this question definitely settled a few days since. An elbow was put on the end of the blow-off pipe which entered the mud-drum. Into this elbow a plug was screwed, which was tapped to receive a half-inch pipe; to this pipe a steam gauge was attached and the blow-off cock opened. On comparing the gauges attached at the top of the boiler, and to the mud-drum as described above, it was found that the pressure was the greatest at the bottom by some pound a half, thus proving that the pressure at the bottom is, the indicated pressure plus the weight of the column of water."—*Locomotive.*

The Fields Steel.—Some weeks since we copied from the *Iron Age* part of an article on this subject, which was taken from the Troy *Daily Press*. It now appears that the report therein given was too highly colored. The *Iron Age* has received a letter from a gentleman who witnessed the experiments, and who says: "The experiments were *far* from being satisfactory to several persons present, and the quality of the article made was not equal to the "puddled steel" made at the works every day."

Temperature of Boiling Water.—This is not, by any means, always 212° F. It depends upon the pressure to which it is subjected. It is 212° only at the ordinary atmospheric pressure. In Quito, 6,500 feet above the sea, it is 194° F. In steam boilers the temperature of the water is the same with that of the steam. The greater the pressure, the greater the temperature of the steam; and to make more steam, the water must be equally hot with the steam already made.

Copying-Press Attachment.—A sheet of steel, so curved as to be highest in the middle, is placed upon the bed-plate of the press, and upon this the book is laid. When the platen is screwed down, the pressure comes first upon the middle of the page, and thence gradually towards each end. By this means the dampened sheet is brought into more perfect contact with the written page, the air being expelled, and wrinkles prevented.

Large Lathe.—At the Creusot Iron Works (France) is a lathe which will operate with 75 different velocities, and will shape surfaces of four inches to 47 feet in diameter. The greatest distance between the points is 13 feet 1·5 inches. The total weight of metal composing the machine is 95 tons.

Scientific Progress.

Extraction of Sulphur from Waste by Means of Superheated Steam.

Prof. Wurtz devotes a page of the *Chemical Repertory* for January 17th to a new process, patented by Mr. Divine, of New York, for separating sulphur from the effete materiel remaining after the use of iron oxide for purifying gas; thus not only rendering the iron oxide again fit for use, but also saving the sulphur,—an item amounting, in the yearly gas-make of New York, to some $250,000. Prof. Wurtz has for months closely watched the progress of Mr. Divine's experimentation; and he speaks in the highest terms of his ingenuity, and of the pertinacity with which he has clung to his idea until he has finally mastered all the difficulties which one after another presented themselves. We quote a few paragraphs:

"It is easy for a chemist to appreciate the considerations which have led Mr. Divine to the use of *superheated steam* as a medium through which to distil off the sulphur with the least liability of producing such molecular change as to diminish the activity and facility of the reaction between the iron oxide and the sulphide of ammonium of the crude gas—a reaction upon which, as my own chemical researches have indicated, the action and efficiency of the oxide as a purifier is chiefly dependent. Another important practical point is, that even were it possible, by simple distillation, to extract the sulphur, without injury to the residue, it would be hard to adapt apparatus composed of the only available materiel, iron. I have found that this material is too rapidly attacked by melted sulphur, at heats at which the latter can be distilled. In an atmosphere of steam this does not appear to take place, a very remarkable fact, first developed by Mr. Divine.

I may state, in this connection, that the problem of separating sulphur from certain other materials by distillation with superheated steam is one which had occupied my own attention in the laboratory before I became acquainted with Mr. Divine's plans; but in consequence of the many practical difficulties found and foreseen by me in the application, I was obliged to abandon it."

Detection of Different Red Dyes.—M. Tardieu gives the following methods: *Garancin-red* is not altered by solutions containing three or four per cent. of hydro-chloric acid or of ammonia. The liquids are not sensibly colored. The color is the most resisting of organic reds. *Cochineal-red* plunged into a solution of ammonia changes to violet, and communicates a very bright violet tint to the liquid. *Murexid-red* bleaches rapidly in simple contact with a solution of citric acid. *Carthamus-red* is completely decolorized by a short ebullition in a one-half per cent. solution of soap. *Aniline-red* is decolorized very rapidly by contact with ammonia, but the color is restored either by the addition of an acid or by the evaporation of the alkali. Marsh's apparatus reveals traces of arsenic. *Corallin-red* does not dissolve in cold water. It cedes a little of the color to boiling water, but is decolorized much more rapidly and completely by boiling alcohol. Alkaline liquids do not turn the color; acids precipitate the coloring matter in yellowish flakes.

Spectroscopic Analysis.—To sum up in a few words those principles of spectroscopic analysis which are our chief guide in solar researches: An incandescent solid or liquid gives a continuous rainbow-colored spectrum; an incandescent gas gives a spectrum of colored lines; and an incandescent solid or liquid shining through a vaporous envelope gives a rainbow-colored spectrum crossed by dark lines, and these lines have the same position as the bright lines which belong to the spectra of the vapors which form the envelope.—*American Exchange and Review.*

State of Science in England.—The new scientific periodical, *Nature*, says: It is stated that the Council of the British Association for the Advancement of Science have determined to ask the permision of the Lord President of the Council to appear before him as a deputation, to urge upon the Government the need of a royal commission ;to inquire into the present state of science in England.

A New Spectroscope.

The *Journal of the Franklin Institute* for December gives a translation, by Prof. Mayor, of a paper read before the Royal Saxon Academy of Sciences by Prof. Zöllner, describing a spectroscope of his own construction. By its aid, it is expected that the displacement of the lines in the star spectra, upon which calculations in reference to changes in star distance must be based, will be made more evident, and such calculations be consequently greatly facilitated. He thinks, also, that several other mechanical difficulties in the pursuit of spectroscopic research, will, by the new instrument, be obviated. He names it the *Reversion Spectroscope.*

Action of Sunlight on Sulphurous Acid.—Oscar Loew, Chemical Assistant in the New York City College, read a paper at a late meeting of the Lyceum of Natural History, in which he gave the result of some experiments instituted to determine whether sunlight, under the influence of which plants reduce sulphur from its oxygen compounds, has any reducing power upon these compounds outside of plants. We quote: "I exposed diluted sulphuric acid, solutions of sulphates, sulphites, and aqueous sulphurous acid, under various conditions, in sealed tubes, to the sunlight. With sulphurous acid only did I notice any change; and even the tubes containing this remained *clear during two months*, but after that time a change set in which slowly increased, and sulphur was deposited in a finely divided state. Sulphurous acid was thus gradually reduced to sulphur, but *oxygen was not liberated;* another part of the acid having been oxidized by it to sulphuric acid. It seems singular that such a period was required to initiate this change; and it would appear that a previous absorption of a great amount of light was necessary to the separation of the first atom of sulphur, which was followed then, however, by more atoms at shorter intervals."

Coal-Genesis.—"In my consideration of the subject, I am led inevitably to associate the coal-making process with *iron* held in solution in the waters of the coal-making epochs. The iron compounds which always accompany coal are *pyrites* (never pyrrhotine) *chalybite* or siderite, *ferrous hydrate*. These come of course from the fragmental beds which intervene between the coal-seams, and must have been conveyed in solution, having been brought into that state by action of oxygeniferous water on the sulphides of the crystalline schists from which these fragments originate. Hence the reason why little or no coal genesis occured before the carboniferous, as, previous to this, the atmosphere was not sufficiently oxygenated as yet by the influence of Life, the great and only oxygen-maker (according to the author) to form the ferrous solutions necessary, that is over the general terrestrial surface. Nevertheless such oxygenation may have occurred locally before this era, and hence the local formation of coal which some geologists maintain, in sediments older than the carboniferous. * * Another dissolved ingredient must have been carbonic acid. * * Coal, then, is the normal product of a peculiar eremacausis of organic matter in waters containing ferrous sulphate and free carbonic acid. Enormous pressure upon a plastic mass has without doubt been a subsequent and essential element."—*Wurtz.*

Heat of the Moon.—M. Marie-Davy,—who determined, contrary to the conclusion of Lord Rosse, that the moon gave out no heat,—has now retracted his statements, being by further experimentation convinced that its rays do contain a perceptible amount. Several other scientists, among whom is M. Volpicelli, have come to the same conclusion.

New Freezing Mixture.—M. Galletly says: "When citric acid and crystallized carbonate of soda, in powder, are stirred together, the mass gets into a pasty state, and in a short time becomes quite liquid. If equivalent proportions are used, the temperature falls from 60° F. to 8° F."

Bone Caves of Australia.—The explorations are still going on in the caves of the western district. A shaft sunk in one of them to the depth of fifteen feet shows bone fragments all the way.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Bright Prospects.—*Chronicle*, Jan. 22d: At no time since the first settlement of this county have its mining prospects been so encouraging as they now are. We believe that the coming summer will see us shipping bullion from at least three, and, very likely, half a dozen claims. Some of our companies will erect mills before fall. This will be the case with the Tarshish, from which a large quantity of very rich ore is being taken. The Exchequer have good ore in sight in the Buckeye 2 claim, and as the Co. have purchased Davidson's mill, they will commence the shipment of bullion early in the spring. The Leviathan have the furnaces and machinery for smelting works at the mine. The Pennsylvania have good ore in sight, and next summer will, in all probability, see a mill at the mine. It is in contemplation by the Pittsburg to erect hoisting works over the Wide West shaft. The Mountain Co. will cut into their ledge before many months. The Imperial tunnel is approaching the Florence ledge, and the Mount Bullion will reach the Duke of Wellington in a few months. The M. C. M. Co. have commenced work in earnest. English capitalists are taking hold of our mines, there being four that are now worked by London companies.

Items.—*Miner*, 22d: The Winchester Co. have let a contract to put their tunnel in order....The whole face of the Wide West tunnel is now in rock which will assay ten to fifteen dollars per ton....In the Globe tunnel a decided improvement has taken place in the looks of the rock....M. C. Tunnel No. 3, is getting better ore than ever....In the Exchequer, quite a gang of men are at work, and the developments are satisfactory.

AMADOR COUNTY.

Placer Mining.—*Ledger*, 29th: Since the late rains, several miners have gone to working placer diggings, and in some instances have done well—making from three to five dollars per day.

Ditch.—Another survey is making on the contemplated extension of the Butte ditch. The object is to bring the Mokelumne river to the top of the hill south of Sutter Creek for the purpose of furnishing water power for the quartz mills. Another advantage will be the opening of new placer diggings known to be good.

BUTTE COUNTY.

Gold in the Buttes.—Sutter *Banner*, 29th: Some years ago gold was discovered in a ravine on the southwest and was worked at good profit by a "rocker." This was thought to be the only place where gold existed in those hills. Last Monday we went prospecting. We "panned out" for over two hours; secured at every pan from one to three cents in coarse dust, and in one we found a little nugget which is thought to weigh 25 cents. Not only this in the bed of the creek, but we find good color in the bank. If sufficient water could be had for sluicing we doubt not this would be rich. It is believed quartz mines will yet be found in these hills.

MARIPOSA COUNTY.

The Fremont Estate.—*Gazette*, 28th: We have no hesitation is saying that the future for the town and county looks brighter than for years past. This is caused, to a great extent, by the resuming of work on the Mariposa mine. At the present time the main shaft is sunk down nearly 200 feet, and the vein is gradually increasing in width, being about 5¼ feet wide, and the rock has paid regularly. It gives every indication of rivaling the old Princeton vein in richness, while it can be worked with half the expense. The present proprietors of the Estate are running about 100 stamps, capable of reducing 100 tons of ore per day; and have contracted for the erection of a 60-stamp mill at the Merced river.

NEVADA COUNTY.

Starting Up.—*Transcript*, 25th: The miners now have abundance of water for hydraulic purposes, and claims have generally started up. Sargent & Jacobs, at Quaker Hill, are in full blast.

North Bloomfield.—Cor. of same, 26th: The late storm has filled the ditch, and the company will immediately start up, and employ a large number of hands. They have been to a great expense in refitting their claims, and have added two large-sized monitors to their working power.

R. C. Black has started up his old claims, working night and day, and employing 10 men.

Hydraulics.—Same of 27th: At Omega more ground is being washed off than ever before since the place was settled, and everywhere in the county the hydraulic mines are of a more permanent character, and the owners have made more extensive arrangements for work.

Pittsburg.—We are informed that they have struck the lead in the south shaft. They have been running for this a year. The mine is now paying handsomely.

Kansas Claims.—Same of 28th: Though the channel has not yet been struck, as reported, there is every indication that the tunnel is very near it. The shaft is down 180 feet, and a tunnel has been run between 400 and 500 feet from the bottom. The last 40 or 50 feet has been run under a stratum of quartz gravel, five feet above the top of the tunnel. It is believed that this is a bench which connects with the main channel.

Deer Creek.—Several Chinese companies are working the tailings on Deer creek, and ravine claims leading to the creek, the latter generally under lease from white men. Recently one company struck a very rich spot, and took out a large amount in coarse scale gold.

Millhorn, Baldridge & Huff have commenced operations on the hydraulic claims near the Vernon House.

Marietta.—Same of 29th: This mine, located above Omega, on the west bank of the Yuba, is owned by Lindsey & Co. The last crushing was taken out where the ledge was 12 feet wide, and all the rock was run through the mill, paying $25 per ton. At the point they are now working, 75 feet below the surface, the ledge is 14 feet thick. The average yield of ore last season was $17.50 per ton. The mill has now 10 stamps. It was started up last week.

Started Up.—The 8-stamp mill of W. C. Stiles, at the south end of the suspension bridge, is again in operation, after being idle more than a year. The mill is in first-rate order, and has two Eureka rubbers below the battery.

Quartz Prospecting.—A new lead has been found on the Red Dog road, one on Gold Flat, and another on the Willow Valley road. All of these have had rock crushed, and paid well.

Little York.—The Water & Mining Co. took 114 ounces of amalgam from the under currents in the two last clean ups, and it is estimated that the receipts for the balance of the season will amount to $10,000 per month.

Relief Hill.—Same of 30th: The Union, Eagle, North Star, What Cheer, Waukashaw and the Great Eastern are running tunnels, and have fair prospects. The Waukashaw has sunk a shaft 27 feet deep, struck bedrock, and obtained a first-rate prospect. They are running up a tunnel through which to wash.

Pittsburg.—*Gazette*, 27th: Commissioner Wilson has rendered a decision, on the application of the owners of the mine, and ordered the patent to issue. The application was contested by Williams & Co., but the Commissioner held that the conflict was of a character that would have to be settled in accordance with the mining laws of the district.

Moore's Flat.—Same of 28th: A friend yesterday, informed us that the miners are all up and doing at that place, water for hydraulicing abundant, and money plenty.

Empire.—Grass Valley *National*, 25th: Things are lively at this mine, and the ore now being taken out is rich. The mill is busy day and night, and 40 tons of ore per day is reduced. The tenth level has been opened, and the ledge is from 15 to 20 inches in thickness. The main shaft is down 1,000 feet—the ledge in the bottom showing free gold and sulphurets in great quantities. Same of 29th says: A gentleman just in from the Empire, tells us that nearly every shot in the ninth level produces a candle-box of rich specimen ore.

Allison Ranch.—Feeney & Co. have taken a contract to sink the main shaft 50 feet deeper. Contracts have been let for taking out ore. The ledge in the bottom of the main shaft, from four to five feet in thickness, fairly sparkles with gold, and rich, heavy sulphurets.

North Star.—A friend informs us that ore is now being taken out from the eighth level, which will average from $40 to $60 per ton.

Grass Valley Consolidated.—Grass Valley *Union*, 27th: From this mine, better known as the O'Connor, 51 loads of quartz gave $6,993 worth of gold, or $137.11 to the load. Dan Collins informs us that the rock crushed was taken out in 22 working days by three men, and was not selected. This mine has been idle for a long time.

West Eureka.—Same of 30th: Several persons who visited the mine yesterday report that the ledge is looking exceedingly well. The rock, to all appearances, comes out of the old royal ledge Eureka.

Greenhorn.—Same of Feb. 1st: This ledge is showing wonderfully rich. In the last three or four days gold to the value of from $5,000 to $6,000 has been taken out.

PLACER COUNTY.

The Weather.—*Herald*, 29th: The late rains were warm, and extended to the summit of the mountains, carrying off the most of the snow, and furnishing an abundance of water for miners; but we must have more snow in the mountains, or the supply of water will run short early in the season.

A Big Strike.—An Auburn telegram of the 2d, says: "An immense strike in quartz was made to-day at the Good Friday claim, about one mile below this place, at the foot of Bald Hill. The claim is leased by Messrs. Corvan and Battis. Rough estimates put the value of the rock at $40,000 to the ton."

SHASTA COUNTY.

Good Prospect.—The *Courier* says that Peckham, on Mad Ox, has sunk 27 feet, and at that depth took 80 pounds of average rock from which he extracted $9 by hand mortar.

SIERRA COUNTY.

Camptonville.—Cor. of *Messenger*, Jan. 29th: We move along, thinking that something will be struck soon. Only last Saturday a boy picked up a piece of rich rock, right at the edge of town. The owners of the Post Hole ledge, that was struck last fall, talk of going to work again. Last week, at the Alaska mine, the ditch broke and filled it to a considerable depth; but it is cleared out now. The Gold Ridge Ditch Co. has formed an incorporated company under another name, and will take the water to Depot Hill, known to be rich.

The late rains have encouraged placer mining a good deal, though such claims are nearly worked out here. Hugg & Co. will finish Camptonville this season. At Young's Hill they are about to put off a blast of 100 kegs of powder, to break up the hard gravel.

SISKIYOU COUNTY.

Eliza.—Yreka *Union*, 21st: Lash tells us that he has shut down on crushing, preparatory to removing the mill to the mine. His last run was 17½ tons of unassorted rock, from which he took 19 ounces.

Mining in Town.—John Knapp has found a good layer of gravel in his shaft. Brady & Co. have cut through the hard cement, and are in good paying ground.

TRINITY COUNTY.

Canon Creek.—*Journal*, Jan. 29th: Jas. Gilzean is opening a claim on Corral bar, and has found good pay. On East Fork, G. Anstead obtains excellent prospects. Gil. McCarty is taking out two and three-ounce slugs. James McConville is doing well, with favorable prospects. Baumgartner & Co., at Tyson's, are making big wages. All along the creek, and particularly from Dannebrink's to Tyson's, the mines are paying. Adam Burger's claim pungles better than ever. From $25 to $50 are picked per day while sluicing—two men at work.

Arizona.

Big Bug.—Prescott *Miner*, Jan. 15th: Recorder Potts tells us that the battery and inside plates of the Big Bug Co's mill had been cleaned up, after a run of six or seven days, and a great bulk of gold got—not retorted when he left. Mr. Hitchcock had men on the Independence lode, getting out rich ore. The Eugenie extension claim continued to yield plenty of paying ore, and there was enough in sight to keep the mill going for months. Mr. Potts intended to commence sinking on the Deposit and Safford lodes.

L. C. Gray and F. H. Wunderlich have arrived with later news and lots of gold. We saw one bar that weighed upwards of $1,200.

Another "Big Thing."—A party of men have arrived from the north with exciting news. They report, privately, that 300 miles north of Prescott, they found, in a mountainous country, diggings that prospected from two bits to $6 to the pan. The party consisted, originally, of 24 men, and started from White Pine about a year ago. On reaching the Big Colorado, 12 men left the party; the remaining 12 crossed the river near Callville, pushed on east, struck a fine gold country, well watered and timbered. While prospecting it, they were attacked by Indians, when three of the party were killed. The remaining nine then started for this place. They will soon return.

Colorado.

Swansea.—Georgetown *Miner*, Jan. 13th: This is a new town and smelting works four miles below Georgetown. Everything will soon be in operation.

Summit County.—Snake River items: Work on the Comstock progressing favorably....Michael Doud is taking out good ore from the Napoleon....Black & Miller still working on the Cooper extension.

Par Tunnel.—Survey completed, and work going on at the rate of 18 feet per week.

Bullion.—Hupeden & Co., on Tuesday, shipped 1,016.20 ounces of silver bullion, coin value, $1,126.24....Baker Co. ship to-day two bricks, one weighing 1,022.75 ounces, coin value $1,032.67, the other weighing 1,046.25 ounces, coin value, $1,013.17. Franklin Co. shipped, during last week, three bricks of silver bullion, respectively, 233 ounces; 563 ounces; 449 ounces. Total, 1,235 ounces, coin value, $703.54.

Terrible Mine.—Same of 20th: Shaft now 185 feet deep. Six drifts, aggregating 578 feet. This mine has yielded $260,000, and shows no evidence of less yield in the future. The first-class ore is shipped to Newark, New Jersey, or to Swansea, England. The second-class, is treated in Georgetown by chloridizing, roasting, and subsequent amalgamation.

Briggs.—Central City *Herald*, 10th: The mill is crushing 30 cords of ore from its own mine per week, which continues to give as large a yield as ever. From 25 to 50 tons of selected ore is sold to Prof. Hill every week.

Gold Hill.—Boulder *News*, 11th: Eric Bottolfson & Co., have struck a solid body of mineral nine feet thick, at the depth of 120 feet. It yields under stamps, from $80 to $100 a cord, for the whole vein. The 18-inch vein to the present debth gave $300.

Ni-Wot.—The sale of the property under the liens, has been adjourned one month. Work has been recommenced on the lode, and 20 stamps are running. Several parties are taking out ore in Ward District, to run in the spring.

Chicago Creek.—Ten men are at work sinking on silver lodes. Gray & Wilson are down 25 feet and have a very rich vein from six to 15 inches wide....Todd on the Plymouth Rock has good looking ore at 18 feet. On the Chief, they are down 60 feet. So far the ore is of a kind easily worked. Assays of these different lodes show from 200 to 1,000 ounces per ton.

Nevada District.—Same of 27th: The mills in operation this winter are Potter's, Clayton's, Sullivan's, Whitcomb's, and Clark's, (leased by Chatfield,) sixty-six stamps in all. Mr. Fagan on the Sparks lode has an engine up and a 4-inch pump in his shaft.

Idaho.

Loon Creek.—Cor. of *World*, Jan. 20th: "The snow is about eight inches deep in Oro Grande. A portion of our miners have gone to rocking, and are taking out enough to pay expenses. Mining will commence here about the 1st of March. Loon Creek, from here to its mouth, 40 miles, is being prospected."

Montana.

Phillipsburg.—Cor. of Helena *Gazette*, Jan. 20th: The Yankee Charley Tunnel Co. are still at work on the Apache hill. Merrell & Ullery intend to keep the St. Louis mill in quartz from 50 feet of the Comanche lode, and from the Mountain Queen lode; they have fully 1,000 tons of ore the start of the mill and are taking out a large amount every day. The Cole-Saunders Co. have 1,500 tons ready for the mill. The majority of our old discoverers have become Professors, and are taking out the silver without assistance. Here is Prof. Ethridge, making fair wages by pounding up float quartz in his hand mortar. Silver bricks are more plenty than greenbacks.

Struck It.—*New North West*, 14th: Nevius & Thayer struck the lead in Highland Gulch on Jan. 6th, at 500 feet in, having been within 10 feet of it when they quit in Oct. '68, to take a trip to the States.

Cedar Creek to Date.—"Jim Vogan" came in this week. He is contented with Cedar. He estimates the number of men in the camp at full 1,000, and met 150 on the road. Few are coming out. In Louisville, 20 houses are building; in Cedar Junction, 60. Meals are $1 in dust; wages $6. In Oregon Gulch, prospects of two and three cents to the pan are found in the gravel, but bedrock has not yet been reached, although a hole was sunk nine feet. The best prospects seen by Mr. Vogan, were $3.75 per pan, taken from "60 below," on Cedar, where bedrock is nine feet. General prospecting is being done from "80 below" to "132 above," in Barrett's district.

Moose Creek.—*Independent*, 15th: Last week, a party of 11 men came over the range. They report that the gulches across the mountains all contain gold, from Moose creek to the head of the St. Joseph river, and that the gulch just across the divide from this creek was discovered some time ago, and mined within four miles of the summit, under the name of Medicine gulch. Some very rich ground was opened on Moose creek late in the season.

Judging from the number of paying gulches on the southern slope of the Coeur d'Alene mountains, experienced miners are of the opinion that we are on the line of an extensive gold belt, which has been less prospected on this side, and that this as a mining region is just in its infancy.

Sable City.—On Monday the mill erected by Hauaur & Co., was started up. Everything worked smoothly. Some 250 tons of quartz are now at the mill. There is every reason to believe that the mill will yield $6,000 or $7,000 per week.

The Prospects.—Virginia *Times*, 19th: From Madison and Beaverhead counties, and all sections of the Territory we learn that the miners are in the best of spirits owing principally to the depth of snow on the mountains. Next summer, we predict, will be the season *par excellence* for placer mining.

Nevada.

COPE DISTRICT.

Mining Sales.—Elko *Independent*, Jan. 26th: A. J. Cope sold, on the 22d inst., 100 feet in the Argenta mine, to W. H. Ramaey and J. A. Hardin for $6,000 in gold. John T. Enright has sold 12½ feet in the Mountain City mine, for $400 in gold.

Bullion.—Reinhart & Co. received yesterday, by stage, five bars of bullion, valued at $2,300, from the Mountain City and Keystone mines.

A test of five tons of ore from the Great Republic mine, returned $75 per ton. The ledge is four feet in length.

HUMBOLDT.

Oreana.—*Register*, 29th: We understand that Mr. Mosheimer, of San Francisco, has taken the Oceana smelting and milling works, and is putting the same in order for reduction of ore. He hopes to be able to work any of the refractory ores of Humboldt, and has purchased a large lot of base metal ores as high as $40 per ton.

Reports from the Cumberland and the Register mines are very encouraging.

Union.—Judge Pease has now shipped to the English mill on Truckee 100 tons of ore from the Union Series, Winnemucca, which yielded a little over $87 per ton. He is taking out and sacking about 10 tons per day.

Unionville.—Cor. Elko *Independent*, 26th: The stagnation in business is occasioned by the fact that all the mills have a supply of ore on hand, including tailings, sufficient to keep them running for four months, and it is thought advisable to reduce the men to a light working force. The shipments of bullion will continue, but the amount of shipping ore will be materially reduced for the next four months.

REESE RIVER.

Bullion.—*Reveille*, Jan. 29th: During the week ending this date, the Manhattan mill produced 17,777 ounces of bullion.

An Austin telegram of Feb. 1st, says: A newly discovered mine at Mineral Hill produces ore that assays $1,962 per ton.

WASHOE.

New Tunnel.—*Enterprise*, Jan. 27th: A gentleman of experience is contemplating a tunnel from a point below Silver City up under American Flat and back under the range of hills to the westward, far enough to tap the leads in that locality.

Reported Strike.—Same of 28th: It was reported last evening that a body of very fine ore had been struck in the Sacramento mine, Cedar Hill. The company intend building a mill near the mouth of their tunnel.

A Grand Awakening.—29th: We understand that there is a great mining revival in Silver City vicinity. A great number of old mines are being reöpened, and some new ones located.

WHITE PINE.

Weekly Mining Review.—*Empire*, Jan. 30th: Matters have been without material change for the week. The mills have generally been kept busy, though the bullion product, for some reason, has fallen below the usual standard. Our exports amount to but $32,493.79. The case metal shipments, however, continue to increase. A great many furnaces are in course of erection, and still more are projected. It is believed by many that smelting is to be the great and permanent interest of eastern Nevada. There is no limit to our smelting ores. We hear of new discoveries and developments almost daily along the Base Range.

Items.—*News*, 29t Aurora South employs 30 men in the mine, most of them extracting ore....Blackfoot has a 40-foot tunnel and a winze from it 70 feet down from the surface....Butler is yielding a large quantity of good ore from the 30-foot shaft and the ledge is increasing in size. ....Crown Point No 8 is down 14 feet with a rapid improvement in width of ledge and quality of ore....Dick Turpin is being prospected by tunnel and shaft. The ledge is opening up large, showing an imense quantity of high grade ore. ....Imperial is taking very rich ore from the tunnel. The ore is sold readily at the dump....United States has been purchased in whole or in part by an Eastern Company. ....The furnace of Van Wyck & Co. started up Tuesday, on ore which will yield 50 per cent. of metal. The furnace has a capacity of 12 tons per day....Metropolitan mill is thundering away, and still has 200 tons of ore on hand.

Items.—*Empire:* Caroline now promises to be one of the best mines in Ophir district. The owners have been offered $20,000 for one fourth but have refused it. A mill will be put up in the spring....Raymond's furnace fired up on Friday. The first mine produced bullion carrying an average of $90 of silver per ton....Aurora South ships ore to the Metropolitan and Stanford mills....Eberhardt employs 20 men, and has an abundance of good ore in sight....Col. Butts is turning out some rich ore.

New Mexico.

Mining Items.—Elizabethtown *Telegraph*, Jan. 15th: Mr. A. L. Webb, an attaché of Maxwell's mill, Ute creek, informs us that the shaft on the Swansea lode is sunk 28 feet in a true vein of gold-bearing quartz. He furnishes statement of last week's clean-ups in the 15-stamp mill, of retorted gold, making a total of 488 ounces, valued at $20 per ounce in currency, at $9,760. We are rather of the opinion that the above should read weeks instead of days.

The new mill on Ohio gulch, is rapidly approaching completion.

The remainder of the machinery for the Ohio mill, arrived this morning,

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

[Compiled weekly from advertisements in the Scientific Press and other San Francisco journals.]

ASSESSMENTS.

Name, location, amount, and date of assessment.	Day delinquent.	Day of sale
Alleghany, Sierra co., Dec. 30, 50c	Feb. 7	Feb. 28*
California, White Pine, Jan. 18, 50c	Feb 21	March 14
Cons. Chloride Flat, W. P., ec 14, $1	Jan. 29	Feb. 24

San Francisco Prices of Copper Ores.

San Francisco, Feb. 4, 1870.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

◆

British Columbia Mines.—The reports from the new mines on the Peace river are so favorable that a rush thither may take place this year. The excitement in Victoria is said to be intense. The difficulties and expenses of the journey are, however, very great, and it is thought that a new route must be found.

San Francisco Mining Stock Market.

MISCELLANEOUS STOCKS.

In miscellaneous securities we note a sale of ten shares of Spring Valley Water at $63 50, and five shares of California Steam Navigation Company at 50 per cent. The former incorporation will disburse its usual monthly ½ per cent. dividend on the 10th inst.——The San Francisco Gas Company has announced its monthly dividend of ¾ per cent., payable since the 1st inst.——North Beach and Mission Railroad also declared its usual dividend of ½ per cent.—— The Merchants' Mutual Marine Insurance Company pay a dividend of 1 per cent. on the 10th.——The Pacific Bank disbursed their customary 1 per cent. dividend on the 1st.——The California Theatre Company also pay ½ per cent. dividend out of the January earnings.——The Sacramento Gas Company paid its usual dividend on the first of the present month.

MINING SHARE MARKET.

The mining stock market exhibited marked activity in a number of prominent stocks, under considerable fluctuations; however, the tendency has been to lower figures from opening rates for the week under review.

The majority of a committee, appointed by the Board of Brokers, reported a bill containing the following provisions, amendatory to the Mining Incorporation Laws of the State, which was adopted by a vote of nearly the entire Board, and the President directed to present it to the Legislature, and urge its passage:

Overman—was in the market to a moderate extent, at uniform figures. A letter states that the richest ore ever taken from the mine was extracted during the week closing with January 30th. The ore-body is reported to be widening and yielding a large quantity. They are making preparations to open the 600-level, and the 226-level shows an improvement. During the week ending January 30th they extracted 739 tons of ore.

Sierra Nevada—increased in sales the past week. During the month of January the mill reduced 1,827 tons of ore, or 65 per day. The gravel deposits are reported to be looking and yielding quite well, and, taken altogether, everything exhibits a more favorable aspect.

Hale & Norcross—was in rather light request at improved prices. For the week ending January 29th, the yield was as follows: Upper mine, 279 tons; lower, 1,254¾—total, 1,533¾ tons. On band, 6,472¼ tons, of which 2,455 tons is low grade. On the sixth level the ore-breasts continue to look favorable in all the openings. Cross-cut No. 4, on this level, at the extreme southern working, has now penetrated the vein 10 feet, and has not yet reached the west wall, but the ore at this point is of low grade. The drift on the ninth floor of the fifth level has passed through the south ore-body at a point 70 feet south of the workings on that level, the ore being 11 feet wide and assaying $55 to the ton. The east drift on the 535-level is now 327 feet east of the shaft. The middle vein on the 300-level is yielding a very good quality of ore.

Gould & Curry—sold somewhat more freely. During the week ending January 31st they extracted 312½ tons of ore. At the seventh station of the new shaft the drift going southwest has the "west country," and the drift south runs in porphyry. The north drift has clay and bird's-eye porphyry. The north-west drift has a pure article of quartz, carrying no metal, and quite a large stream of water is flowing from this body of quartz. Later reports say this body of quartz continues and looks encouraging, and that the drift had penetrated the quartz about five feet, but samples assayed show no metal worth mentioning. The faces of the other drifts show no change.

Chollar-Potosi—was less active than the previous week, commanding uniform rates. For the week ending January 28th, 1,040 tons of ore were extracted. No material change in the mine since the previous report. At all points the ore is said to be of good quality, and in quantity there is no diminution. At the new shaft the drift from the 440-level is progressing rapidly, the material through which they are running consisting of clay and porphyry.

Kentuck—exhibits a very material decline. Reports to the 29th of January, state that the mine is yielding from 50 to 60 tons of low grade ore per day. So far as known, the ore between the 900 and 800 levels aggregates about 500 tons, valued at $20@25 per ton; between 800 and 600 levels, 1,000 tons, valued at $30; between 600 and 450, the ore will not cover more than cost of extraction. The smoke and gas from the smoldering fires still prevents them from working the east ledge, between the 800 and 450 levels.——Belcher received $7,647 50 in bullion on the 29th ult.——Crown Point exhibits no change for the better.—*Commercial Herald.*

Wise Action.—In accordance with an act of the Legislature, the Massachusetts Board of Agriculture offers three premiums for treatises on roads and road-making—$200 for the best, $125 for the second, and $75 for the third. Such action as this is highly laudable. A similar bid might bring forth something which would show what we ought to do to get some decent pavement for our streets.

◆

Nine hundred and ninety-two persons were killed in the streets of London, last year, by horses or vehicles.

Mining Incorporation Laws.

At a meeting of the Board of Brokers in this city on the 2d inst. the following bill, entitled "An Act amendatory and supplemental to an Act entitled an Act to provide for the formation of corporations for certain purposes, passed April 14, 1853," was almost unanimously adopted:

Sec. 1. Section 5 of said Act is hereby amended so as to read as follows: The corporate powers of all incorporations shall be in the stockholders and shall be exercised in trust for them by a board of not less than three trustees, who shall be stockholders in the company, and the majority of them citizens of the United States, and residents of this State; and who shall, after the expiration of the term of the trustees first elected, be annually elected by the stockholders representing a majority of all the capital stock of the company, at such time and place, and upon such notice, and in such a manner, as shall be directed by the by-laws of the company, but all elections shall be by ballot, and each stockholder, either in person or by proxy, shall be entitled to as many votes as he owns shares of stock, and the persons receiving the greatest number of votes shall be trustees.

Sec. 2. It shall be competent at any time for the stockholders representing a majority of the capital stock of any incorporation organized under this Act for mining purposes to remove any trustee or trustees, or any other officer of the company, and to elect another or others to succeed him or them, and such meeting may be called at any time by such stockholders representing one quarter of all the capital stock of such incorporations, either for the purpose of electing such trustee or trustees, or other officer, or of investigating the accounts of the company. In all cases where a meeting of the stockholders is called for the purpose of removing a trustee or trustees or other officer of the company, and electing a successor or successors to the same, or investigating the accounts of the company, whether financial or otherwise, notice of such meeting shall be given in a daily newspaper published in the place where the office of said company is located, for ten days prior to said meeting. When any vacancy shall happen among the trustees by death, resignation or otherwise, it shall be filled for the remainder of the year in such manner as may be provided for by the by-laws of the company.

Sec. 3. The trustees, superintendent and secretary of any mining company, incorporated under the laws of the State, shall within thirty days after the passage and approval of this Act, file in the office of the County Clerk of the county where said office is located, a sworn statement signed by said trustees, superintendent and secretary of the entire transaction of said company since the last annual election, and said statement shall contain a full account of all work done, monies received and expended, and the number of men employed during said time, and the wages paid to each and every employé of said company. And such trustees shall also file a sworn statement with said County Clerk, that they have managed said mine to the best interests of all the stockholders of said company. And said trustees, and superintendent, and secretary shall file similar sworn statements with said County Clerk, as above required, every three months hereafter.

Sec. 4. Where a mining company does not possess its mill, or employs another mill or mills, for the purpose of crushing its rock, the work of crushing such rock must be let out by public competition to the bidder who guarantees to return the greatest percentage of its assay value at the least comparative cost. Notice of the reception of such bids by the trustees to be published at least ten days, in a daily newspaper printed nearest the location of the mine, as well as in one published in the place where the office of said company is located.

Sec. 5. No contract or contracts shall be made by any officer of any mining company, whether for milling, mining, or any other purpose whatever, to extend beyond a period of three calendar months, the same notice to be given as required in section 4.

Sec. 6. A failure to comply with the foregoing acquirements on the part of said trustees, superintendent or secretary shall subject each of them to a fine not exceeding $5,000, nor less than $500, for each failure, to be recovered upon information of any stockholder before any court of competent jurisdiction.

We shall have some comments on this in our next issue.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Badly-Cleaned Wheat.

Wheat is often brought to this market so badly cleaned it is absolutely rejected by purchasers. Often, in such cases, the wheat itself is of excellent quality, and is unmarketable only because it is so badly cleaned that its actual value cannot be ascertained. Of course, when such wheat is bought, the purchaser takes good care to secure a perfectly safe margin for his profit. In other words, if he cannot buy the wheat for less than it is apparently worth, he won't take it at all. Buyers will always magnify any shortcoming of this kind for their own profit, and the consequent loss of the farmer. It is always to the advantage of the producer to bring his grain, especially wheat, to market as faultless as possible. When wheat is good, and thoroughly cleaned, as it always should be, the highest market price can be unhesitatingly demanded and readily obtained. It is a mistake to suppose that the farmer can impose bulk upon the city buyer at the expense of quality. If anything of that kind is attemped, the buyer is sure to be the gainer in the end. Clean your wheat thoroughly at home, and then secure the highest price, and save for your own use the refuse.

What Our Farmers Want.—What the farmers of California, and especially our fruit and vegetable producers, want, is, more direct traffic between the producer and consumer, and the disbanding of the great army of middle-men, which absorbs the chief part of the farmer's profits and takes large bites from the consumers. What possible necessity is there that grapes which the farmers are willing to produce at four and five cents a pound should cost the consumer fifteen or twenty? Why should apples and peaches cost the consumer two or three times as much as the producer gets for them? Our system of traffic is all wrong, and some steps should be taken to improve it. By a proper system, our home consumption of fruit might be nearly or quite doubled, with no increased expense to the consumer, while the health and comfort of the public would be vastly benefited. It is gratifying to note that steps are being taken in some quarters to bring about so desirable a result. Our fruit-growers must combine in this work for their own protection.

Turning Corn into Pork.—Parties in Los Angeles, says the *News*, impressed with the folly of the past in selling corn at twenty or thirty cents per bushel, have determined, for the coming year, to convert their corn into bacon. Corn is now selling for something like thirty-four cents per bushel. Bacon is worth twenty cents per pound. Does not every farmer know that profit will result from feeding corn, at present prices, to hogs? It is simply the exhibition of the most egregious folly to sell corn at thirty-four cents which is worth fifty cents or more per bushel when converted into bacon.

The Ramie on Overflowed Lands.—To persons in the California valleys who may be contemplating the culture of the ramie, it may be interesting to learn that of all the growing crops submerged by the late overflow in Texas, the ramie suffered the least.

How to Keep Onions.—The editor of the Santa Barbara *Press* has been presented with a lot of onions dug in August, preserved since that time in an air-tight box, and now perfectly sound. Mr. Goux, the donor, says that by this method he has kept onions good from October to March.

Preparing Wheat for Seed.

Next to securing seed of good quality, is its preparation for sowing. The best of wheat, as it comes from the thrasher, will contain some imperfect seeds, many of which will germinate, and cumber the ground with a sickly plant, which at harvest mingles its seed with the product of the more perfect plants, and thereby reduces the quality of the crop. If the process of "pickling," now so generally employed, is properly conducted, nearly all these imperfect seeds may be removed.

How to Prepare and Use the Pickle.

Take a half hogshead and fill two-thirds full with a solution of bluestone (six gallons of water to four pounds of the bluestone); then put into the tub a suitably shaped basket capable of holding one and one-half bushels of wheat, and gently agitate the basket by lifting it up and down. All light and defective seeds will float on the top, and can be skimmed off. This being done, the basket should be raised out of the water and allowed to drain for a minute or two, and then emptied upon the floor and left for a night to dry. Eight bushels of wheat can be pickled in from fifteen to twenty minutes. Seed is generally pickled the day before it is intended to sow.

Mr. C. P. Burkhart writes to the Willamette *Farmer* that he has been experimenting in this matter for some years, and has finally adopted the following method:

First, take the wheat and spread on the barn floor, and sprinkle well with water, and stir well with scoop-shovel till perfectly damp, and keep it in that condition by adding water, and stirring till ready to sow. During the process, if the sprout should make its appearance, don't be alarmed, but stir often, so as to give a free circulation of air among the wheat, which will prevent further sprouting. Stir at least every third day, and add water, if necessary, as the wheat absorbs a greater quantity than one would suppose. When ready to sow, dissolve one pound of vitriol [bluestone] for every sixteen bushels of wheat which has been prepared. Sprinkle the vitriol water over the wheat, and stir well. Now the grain is ready to sow—one bushel and three pecks to the acre. Sow any time from the first of February to the fifteenth of March, with perfect safety, and, my word for it, it will ripen several weeks earlier than wheat sown from the same kind of seed not prepared as above, and will yield far more than wheat unprepared. I have prepared, as above stated, and sown alongside of wheat sown in November, and cut all at the same time. Also, I sowed two acres adjoining my prepared seed, taken from the same bin, without being prepared, and the consequence was, the prepared yielded six bushels per acre more than the unprepared did, and the harvesting was fifteen days later.

We should prefer the wetting after the manner first described, with the use of pure water, and the bluestone added afterwards, for the reason that we are thereby enabled to remove the imperfect seeds that cannot be taken away by the ordinary separating machinery, which separate by size alone. When the seed is first wetted with the acidulated water, it will not do to allow it to stand over twenty-four hours, at most.

There is no doubt but that the addition of other ingredients, so as to form a sort of fertilizing paste over the entire seed, will add greatly to the effect produced. Soot from stove pipes is a most excellent material. Superphosphates, or any of the prepared guano manures, considerably diluted, could no doubt be employed in that manner. The decaying matter of the seed itself furnishes the first nutriment for the growing germ; the addition thereto of artificial stimulants in such immediate contact, as described above, greatly assists the further growth of the plant, until its rootlets are able to go further in search of food. The superphosphates, etc., may be added as a powder, which will readily adhere, by a proper mixing, to the moistened seed.

The Santa Cruz Farmers' Club on the Use of Bluestone.

The Santa Cruz Farmers' Club discussed the use of bluestone at their last meeting. Mr. Humphreys, as reported in the *Sentinel*, said by experience he had found that of wheat sown from the sacks without the bluestone process, not one grain in five germinated and produced true wheat free from smut. He firmly believed that in the last twelve years he lost $1,000 in wheat alone, by not following the latter process. His plan was to bluestone early in the morning, and sow immediately. He used one pound of bluestone in four gallons of water to 500 pounds of wheat.

Mr. Monteith said he had bluestoned on the Merced river a crop of twenty acres, used one pound of bluestone to 300 pounds of wheat, and a good crop was the result. Had used salt from pork barrels and the brine) in the place of bluestone, and found it answered better than bluestone. Was satisfied that the salt process was better and cheaper than the bluestone. Lime had been tried, but failed.

Salt Cannot be Substituted for Bluestone.

The Contra Costa *Gazette*, fearing that the above report of the experience of Mr. Monteith may lead some persons to rely upon the substitution of salt for bluestone, to their cost, cautions its readers against any such fallacy, and says that not only salt, but urine and lime and various combinations thereof were thoroughly tried in England long before the virtues of bluestone were known, and that they were proven utterly ineffectual as a preventive of smut.

"What I Know About Farming."—Under the above head, Horace Grecley is now publishing in the *Tribune* a series of articles, which will be addressed more particularly to young men, and the aim of which will be "to make them acquainted with truths and principles that ought to interest all who eat as well as those which produce." Many facts will also be given which Mr. Greeley thinks practical farmers may profitably consider. He claims, in his announcement, that "Agriculture in the future is certain to be very different from what it has been in the past." This is one of the facts which he proposes to demonstrate.

In Mr. Greeley's third article of this series, and the last which has reached this coast, he refers to certain benefits which he hopes may arise from coöperation in farming. This is a subject upon which much may be said, and one which has attracted quite too little attention in this age of coöperation. In drawing attention to these papers, we would also refer the reader to an editorial in another column, on the subject of securing farm homesteads for mechanics as well as farmers, out of our public domain, and wherein a plan of farm coöperation is referred to, which will be more fully enlarged upon in a future issue.

Fall Bearing Rasberries.—A correspondent of the *Hearth and Home* writes to know if fruit growers in the vicinity of New York have made any extended experiments with fall bearing rasberries. The better varieties of this kind to cultivate are the Arnold Canada Red, Belle de Fontenay, and Catawissa. The first two are quite hardy, but the latter rather tender, but very prolific. To obtain a good crop in autumn, the canes should be cut off close to the ground in spring, because the fruit is borne upon the young shoots of the season. Linn's Everbearing and Ohio Everbearing are good autumn-bearing sorts of the black rasberries. We are not aware that the full varieties of this berry have ever been cultivated in California. Would it not pay to make the experiment?

Essentials to Success in Farming.

Every thorough, earnest farmer should bear in mind, as an important fact, that it is not expensive manuring alone, nor thorough culture, nor drainage, nor any other one or two things combined, that can insure success on the farm. There should be united to the above a thorough practical knowledge—an intelligent training to the business, with habits of study and observation. There should be an enlightened and liberal expenditure in experimentation, embracing all the processes necessary to productive cropping and permanent improvement of the soil. This is the kind of farming which always meets with success when properly and courageously carried out. If it fails, it will not be on account of any fault in the system, but because of a lack of skill, or judgment, or care, in carrying it out.

Luther H. Tucker, of the *Country Gentleman*, and Professor of Agriculture in the New Jersey Scientific School, in a recent lecture on the subject of agricultural education, stated that an advanced condition of agriculture requires four essentials—two of them in the man and two of them in the circumstances under which life is placed. They are: 1. Energy. 2. Intelligence. 3. Good markets. 4. Capital. Energy, perseverance and determination are among the primary requisites of successful agriculture. *The greater the degree of intellect to guide the will, the higher the end reached.* Good markets are essential to success in agriculture as in other pursuits. Capital is needful to carry out improvements: and a lack of it, like distance from market, is a circumstance external to the farmer which he cannot always control, and which neither education, intelligence, nor energy can remove.

The Season at the East.—A gentleman at Waterbury, Conn., picked green peas, grown in the open air, for his New Year's dinner. At New London, in the same state, a bed of violets continued in full bloom all through the first week in January. At the island of Martha's Vineyard a gentleman picked a dandelion which had the temerity to grow and appear in full bloom on the first day of the new year, and took it to the editor of the *Vineyard Gazette.*

On this side of the continent the first day of January was one of the most lovely days we have had for the last twelve month.

The *Oregonian*, in its issue of Jan. 4th, acknowledged the reception of a package of plums taken from a tree in the orchard of Mr. Luelling at Milwaukie, in that State, on New Year's day. They were of a second crop, in all respects well and fully matured.

Vegetable Life in Winter.—Modern research has shown that vegetable growth is not suspended in winter, as has been generally supposed. The roots, especially, grow, wherever they are not fast locked in frost; and there is a general, though feeble, circulation of sap during the winter throughout all perennial plants and trees, perfecting the more rapid growth of summer, and slowly aggregating plant fiber from the elaborated portion of the sap which remains after the fall of the leaf in deciduous trees. This action is more extensive and perceptible in evergreens, from the fact that the elaboration of the sap in such plants is constantly going on by the continuance of one leaf until another is matured to take its place.

California Mustard Seed in New York. New York advices state that the principal part of the California brown mustard seed in the New York market has recently been bought up on speculation. The stock was held at twelve cents per pound, in the early part of January; and brown Trciste at sixteen cents.

Dog-Power for Churning, Etc.

Few persons are aware how easy it is to obtain profitable work out of a dog. Such power was largely in use by the ancients, especially for drawing water. All that is required is a wheel on the principle of the revolving part of a squirrel cage, six or eight feet in diameter, and two or three feet wide, within which a dog may be placed. This wheel may be made of rough lumber, mounted on a proper shaft, on which should be placed a driving drum, which may act direct for pumping, churning, etc., or through an intervening pulley and shaft, on which it is well also to place a balance wheel, weighing thirty or forty pounds. A crank and pinion will of course be required. A small-sized Newfoundland or a shepherd dog can soon be taught to work, and will be found quite heavy enough for a half-barrel churn.

Such a power might be readily applied to drive a family sewing machine—the power to be accumulated by winding up a weight, or by pumping water into an elevated reservoir, to be utilized by being drawn off through a small turbine wheel. It might be usefully applied in any farm house, where much churning or sewing is required, and to the great comfort and convenience of the female members of the family. The planning and construction of such work would be a good exercise for the boys. It would serve to develop their mechanical ingenuity, at a trifling outlay for material. It would, moreover, turn worthless dogs to some profitable account.

A Raspberry Tree.—The salmon berry, a species of the raspberry, which flourishes in Northern California and Oregon, possesses a peculiar characteristic, which, according to the *Hearth and Home*, has hitherto been overlooked by botanists—viz: that the stems are perennial instead of biennial, as all other known species of this plant are. A gentleman has sent several of these plants to the editor of the above-named journal, with a view of having them propagated at the East. A statement accompanied the plants, noticing the above-mentioned peculiarity, and also the fact that they grow to a very large shrub. A section of one of the stems is figured in the *Hearth and Home*, showing regular annular rings, from which its age is known to be ten years. Its diameter is two and three-eighth inches one way, and two inches the other—the section being somewhat oval in form. It seems almost incredible that a raspberry plant should grow to such a size, yet the gentleman who forwarded the specimens says the largest so forwarded was quite small in comparison with many growing in his immediate neighborhood. Verily we may believe that the wonders of California vegetation are not half told.

Setting out Trees.—Of late years, says the *Prairie Farmer*, the old way of cutting back the limbs of trees to be planted has been abandoned in Europe. Now the limbs are not cut back, but only such limbs removed as are too close. The middle limb and four or five others are left in their natural state. The second year these limbs are cut back to about half of their length. The result is that soon after the planting in spring, leaves appear at the top of the branches, and by their aid new, small rootlets are generated earlier than otherwise, and that the trees in the second year form stronger wood than if they had been cut back the first year.

How to Prevent the Taste of Turnips in Butter.—B. H. Baldwin, of Bergen county, N. J., says in the *Am. Agriculturist:* "When cows are fed upon turnips or cabbage, the taste may be prevented in the butter by adding about four tablespoonfuls of a solution of saltpetre (1 oz. to the pint of water) to the cream pot before putting in any cream, and stirring thoroughly each time that cream is added."

Animals Eating Bones.

Cows, hogs and other animals are frequently known to chew bones, leather, etc. The reason of this extraordinary appetite or craving was recently asked at a meeting of the Farmers' Club in New York. In answer it was suggested that certain elements were doubtless wanting in their food which bone-dust would supply. Acting upon this belief, in Central New York there are manufactories where bone-dust is prepared especially for stock, and sold to dairymen for this purpose. There is a bone disease sometimes prevalent in the Eastern States, for which bone-dust is occasionally sprinkled in the field where the cattle feed. In districts in England where they feed hogs on whey exclusively, the bones of the animals are said to be sometimes so small that they cannot stand; and this is due to the want of bone-making material in their food. It is doubtless for want of a similar supply in the food of cows that they go for the bones and brick-bats.

Trees and Vines.—The season for setting out trees, vines and shrubs, will soon pass away for the year. From reports which reach us from various quarters, we should judge that a much larger number of trees have been transferred from the nursery to the field this year than at any former period in the history of the State. More than usual attention is being given to nut-bearing and timber trees. The cultivation of trees for fuel would also, no doubt, prove very profitable in many parts of the State where fuel is very scarce and high. Many farmers, whose lands are suitable, are also planting hedges, preferring living fences, that yearly grow better and firmer, to the tumble-down fixtures that are a source of constant expense and annoyance.

The promulgation by the press of facts bearing upon the effect of trees on climate, no doubt, has had some influence in this direction. If our farmers generally, and especially those residing in the valleys, would unite in systematic action in this matter, the result could not fail of marked beneficial effects. But even leaving the matter of climate out of the question, our farmers could not better employ their leisure time than in covering portions of their ground and the adjoining roadsides with trees. Their usefulness for fruit, timber and fuel will yearly add to the value of the land, and will in a very short time become a regular and permanent source of income.

Adulteration of Milk.—At the recent annual meeting of the Milk Producers' Convention, in Boston, the directors reported that from the best information they could obtain, they were satisfied that not less that 25 per cent. of the milk sold in that city was manufactured by adulteration. In Switzerland, when a dealer is found guilty of adulterating his milk, he is condemned to no less than eighteen months imprisonment and the loss of civil rights. The Swiss pride themselves upon the quality of their milk, and take those precautions to maintain its reputation. In Paris, when a man is detected in watering milk, he is liable, beside the other punishment inflicted on him, to have a notice of his dishonesty posted up on his place of business for a series of years. It would be well if we had some such laws in this country.

Influence of Railroads on the Hatching of Eggs.—A peculiar effect of the proximity of railroads on the hatching of eggs has been mentioned in various papers. It has been found that there are scarcely any chickens raised in poultry yards which are situated in the immediate neighborhood of the rails of a much frequented railroad. This fact is supposed to result from the earthquake-like trembling shaking the soil caused by passing trains, which exert an unfavorable influence on the eggs.

Fruit-Growing in Alameda.

[Written for the Scientific Press.]

The Town of Alameda

Is rural in all its aspects; and were it not for the puffing, rushing engines and trains roaring along the railroad, where all the freight to and from San Francisco over the W. P. R. R. passes, together with local passenger trains, Alameda would quietly slumber amidst its forest of evergreen oaks and many planted sorts of noble trees—its cupolas and steeples only peering above the shrouding shade. With regularly laid-out streets, it is not yet crowded with buildings; but fine grassy lawns, elegant gardens and magnificent residences meet the traveler's gaze with a succession of ever-pleasing variety and change.

A Good Example.

While admiring a private garden, covering a whole square, symmetrically laid out, yet agreeably arranged as to walks and borders, trees, vines, shrubs and plants, surrounding a home-like mansion, half hid by native oaks, the proprietress—an intelligent French lady, thoroughly conversant with all the details of gardening—kindly invited me in, and showed me over the grounds. She evidently finds time for recreation and real, genuine, hearty enjoyment in the management of the place and in the tender care of every plant. While conversing with this estimable woman, I could not but compare her pleasing, cheerful mode to the sickly smile of too many of my own countrywomen—too delicate to bathe in the sunny air with blushing cheeks, and too fragile to walk and romp, and laugh and work, among the blossoming flowers.

Many fine residences here are beautifully inclosed, and embellished with artistic skill. But I saw some gardening that was not in good taste.

Haile's Nursery.

I visited the nursery of Mr. C. H. Haile. This gentleman informed me that his business is better this season than ever before. A man of ample and practical experience, his theories are systemized to conform to facts. He gave me much statistical information. His cultivation is very thorough, and the growth of trees and yield of fruit immense, and of the finest quality. While hundreds of wagon loads of fruit rotted on the ground last season in Alameda county, he found a ready sale at remunerative prices for all that his grounds produced, in consequence of perfect training and thorough cultivation. His orchard is planted rather close, so as to gain self-protection from winds. His system of training is upright, so as to allow free circulation of air under the trees, and give free room to plow among them, without interfering with spreading limbs.

Lemons and Oranges.

At Mrs. Dr. Haile's residence I was shown the noted lemon tree, the seed for which the late Dr. H. brought from Panama in his vest pocket, and planted, fifteen years ago, where it is now growing. The tree now stands eighteen feet high, is very symmetrically-formed, vigorous and thrifty, branching low, and spreading sixteen feet across. The lady informed me that at least 250 lemons have been gathered from the tree this season, and I estimate the number on the tree now at 350. This tree has produced fruit several seasons. I saw lemons in all stages of growth, from the blossom to the ripened fruit. The full-grown fruit is of medium size, and very beautiful. The quality is excellent. The skin is rather thicker than the imported lemon, and the pulp less acid, but exceedingly pleasant.

As lemons are more tender than oranges, it is evident that we can grow our own oranges as well as lemons, without going down the coast to do it. It is a well known fact that in the East it takes from eight to twenty years to get pears and apples from the seed without grafting. Even if it takes that length of time here to get good bearing orchards of lemon and orange trees, it is a promising enterprise for our orchardists to go into. I have seen orange trees three years old bearing fruit. The business cannot soon be overdone. It is now pretty generally acknowledged, from experiments already made, that oranges and lemons can be successfully raised as far north as Oroville, with careful cultivation and shelter from prevailing winds. Belts of evergreen trees, such as the Monterey cypress and the *Eucalyptus*, planted around such an orchard, would answer every purpose.

Fruit Vale.

Riding from Alameda to Fruit Vale on a day redolent of balmy spring, the sunlight softened with a haze of fleecy clouds, that cast a living glow upon the green fields and spread a purple sheen over the drowsy waters of the bay, a quiet splendor drowns the sense of care, and charming landscapes open to the view. Fruit Vale is principally occupied by wealthy owners of magnificent homesteads. Nature and art—improving on each—combine to form a pleasant picture.

Low Training—An Unprofitable Experiment.

I noticed one orchard that, when young, had been trained on the low-branching system, the proprietor having been advised to do so by the pretending wisdom of a California journal. A net-work of low-spreading limbs prevented the ground from being properly plowed between the same. Moss and mildew attacked the trees, and the fruit, which was inferior, rotted on the ground. Mr. J. Wilson has taken it in hand, and cut off all side limbs, which sometimes necessitated the removal of two-thirds of the tree, so that he can cultivate the ground and obtain good fruit. I also noticed that several other gentlemen were doing the same thing. It is always proper to allow a tree to spread after it has attained a height sufficient to do so without interfering with plowing; but thorough cultivation should always be the first object, protection from severe winds the next, and, where many trees are together, this can be as well done with erect as with spreading habit. A free circulation of air under the tree near the coast where the air is damp is very essential, and upright training will insure this. The nature of a tree should never be disregarded. If a tree is properly trained from the start, it will generally not require much pruning afterwards. A continuation of the subject of fruit-growing in Alameda will form the subject of another letter. S. H. H.

Nest Eggs.—C. A. Davis, Berkley, Mass., makes nest eggs from real ones as follows: A sufficiently large opening is made to allow the shell to be emptied of its contents. Plaster of paris is then mixed with water to the consistency of cream, and the shells filled with the mixture, which hardens in a short time. The result is a nest egg, perfect in shape and color, and still serviceable if the shell gets broken off.

Farmers' Clubs in Massachusetts.—The Boston *Cultivator* gives a list of twenty-six farmers' clubs, with the officers, in as many different towns in the State of Massachusetts. Some of the clubs are provided with agricultural libraries.

Notices to Correspondents.

W. E., of Dayton, Nevada, thinks that, by the use of reverberatory furnaces, copper ore can be profitably smelted. He says that ores averaging 12 per cent. can be worked thereby at a profit. Each furnace will smelt in twenty-four hours ten tons of ore, yielding two tons of 50-per cent. copper; one cord of wood to be used for each ton of ore; or the ores may be roasted in kilns and the sulphur collected, which would render it profitable to work 7-per cent. ores. The question is one principally of finances, and depends greatly on the situation of the mines, the abundance or scarcity of the fuel, wages, etc.; but in the majority of cases we are afraid that, in the present condition of affairs, copper ores, as such, can hardly be worked at a profit on our coast, unless very rich.

MRS. A. E. S., Meadow Valley.—From your description it would appear that the water contains iron (probably as carbonate), in which case it is rather beneficial than injurious to the health. As the water in a spring is being continually replaced, we know of no *practical* means of keeping the iron continually precipitated. If it will separate out by standing, so that the residue can be used for washing, it would seem best to draw the water for this purpose sometime beforehand, let the sediment settle, and then draw off the clear part for use. You can determine whether the substance is really iron by taking some of the fresh water and testing it with ferrocyanide of potassium, which, if iron is present, will give a *blue* precipitate.

AMERICAN RAILWAY EXCHANGE.—We acknowledge the receipt of a complimentary ticket, entitling us to the privilege of the American Railway Exchange of Philadelphia, the object of which is to furnish convenient headquarters for residents or visitors connected with any department of the railway interest. The leading scientific journals of the country, with reports of surveys, railroads, etc., and the correspondence of the Exchange, will be kept on file for the use of members, to whom will be given various other facilities for business information, etc. An annual subscription of $10 entitles subscribers to the use of the reading rooms and to the services of the Exchange as correspondent.

◆

DARIEN CANAL.—It is said that an easy and practicable route for this canal has been discovered. The proposed line is run from Santa Metora Real to Tneto Conido, and the distance is 38½ leagues.

Public Lands for All and Not for a Part of the People.

A NEW SUGGESTION FOR THEIR EQUITABLE DISTRIBUTION AND SALE.

There has not arisen for many years a subject that comes so directly home to a large majority of the adult population of the United States as that of the judicious and equitable segregation of its public lands, accompanied by its many and important issues. There, consequently, need no apology for entering fully into its discussion, especially as it will hereafter be endeavored to be shown that we, residents of the Pacific coast, possess an important and immediate interest in the statesmanlike disposition of this question.

Little need be said relative to past and present practices. These are pretty well known, viz: that surveyed public land can be purchased by private entry at $1.25 per acre, payable in installments; or unsurveyed lands can be preëmpted to the extent of 320 acres, the same price becoming due in like manner on being surveyed. And, further, within the past few years, Congress, in order to encourage their settlement, and to afford the opportunity to every industrious head of a family of obtaining a homestead, what is termed the "Homestead Law" was enacted, by which any head of a family may *once* claim, by attending to certain rules which are laid down for the purpose, a quarter section, or 160 acres, gratuitously, excepting some small fees for surveying, registration, etc., on complying with this important condition—viz: that the homestead claimant shall cultivate and reside upon such homestead claim for five years before an United States patent shall issue, donating the property in fee.

Equitable and Statesmanlike Laws which Ought to Prevail.

In considering this phase of the subject, class distinctions and class privileges will be wholly ignored, and this the thorough statesman will do, holding in view only what would probably prove the most conducive to the general advantage of the body politic, and that of its individual members. The homestead law, as it now stands, is something like that which is occasionally seen acted by a greedy schoolboy, who, while exhibiting to his schoolmates the contents of a basket containing fruit, cakes and lollypops, checks their longing tastes by remarking that, "those who ask shall not have any, and those who do not, do not want any."

In like manner, by the homestead law, those generally who are in a conditon, from their agricultural occupations, to comply with the conditions respecting residence, are almost always incapable of taking advantage of the privilege, owing to deficiency of pecuniary means; whilst, on the other hand, the city artisan is practically debarred from obtaining a country homestead, however desirous he may be of securing such on which to pass the evening of a well-spent life, because he cannot comply with the condition of residence, excepting at the cost of losing more remunerative urban employment during the vigor of life; and if he postpones the attempt until a later period, when the muscular energy of youth has passed away, he will have become unfitted to be a pioneer for converting a wilderness into a garden. Under the existing system, by allowing "private entry" to be made of public lands that are surveyed without any conditions for the improvement or settlement of such lands thereafter, the agricultural homestead seeker is daily driven further and further from a market and other social convenience, to seek for the same, because, since the price of $1.25 per acre was fixed for Federal lands, their value has increased largely, so much so that it now generally occurs that the speculator so far precedes the homestead-seeker that the former will be found to have gobbled up everything worth accepting by the latter; and this gobbling up by speculators precedent to the homestead-seeker will go on in an accelerated ratio in proportion as the wealth and population of the United States increases, until—as it nearly has—the homestead privilege will become a nullity in practice, unless Congress intervenes to prevent it.

Congress can easily accomplish this by enacting that one of the conditions of the sale of lands by private entry shall be, that a given rateable amount of expenditure in cultivation and improvements shall be made by the purchaser of lands so obtained, and that within a given period or periods on pain of forfeiture of deposit and land. It would also be well if Congress, in place of residence on 160-acre homestead selections, allowed the patent to issue at the expiration of five years, on proof being made that within that time the locator, in labor and improvements, increased the value of such quarter section, say to the extent of $5 or $10 per acre. Such a change in the law would enable many mechanics, miners and others, to obtain what they are desirous of doing—viz: a country homestead on which to pass their old age; while it would tend generally to induce the population of our great cities to become more interested than they have hitherto done in agricultural affairs, and so compensate, in some measure, what Horace Greeley has so ably denounced in the columns of the *Tribune*—the continued crowding of so large a proportion of our rustic population into the cities.

How the Proposed Change would Affect California Mechanics and Miners.

A change in the homestead law, which would substitute cultivation and improvement without necessitating continued residence for five years, would enable city mechanics and artisans to take advantage of the privilege, and would form an appropriate and secure investment for their savings, besides combining many ultimate benefits, not the least among which would be the public advantage derived from the reflex immigration which would follow from the emigration of citizens into rustic districts. As matters now stand, the savings, especially in this city, of provident mechanics, tradesmen, etc., are accumulated in savings banks, and loaned out to inflate the value of city building lots to the great detriment of those who are not the fortunate possessors of such property; whereas, if one-third of the amount of the $25,000,000 so hoarded up in this city was distributed in the acquirement of country homesteads, there would not need to be a single industrious man unemployed in the State. In order to obtain the most profitable results, coöperation on the part of agricultural investors will be necessary, remarks respecting which will be deferred to another occasion. In the meantime, the suggestions thrown out we believe are worthy of serious thought.

To a thorough statesman, it will be apparent that the mode most calculated to bring uncultivated land into a cultivated state in the shortest time, and most efficient manner, is the course which ought to be adopted; also, that no equitable reason exists why, if the condition just alluded to is fulfilled, the professional man, tradesman, miner or mechanic, should not be endowed with the same privilege, practically, as the plowman, especially, if by doing so, the general happiness, wealth and prosperity of the entire community would be thus promoted.

◆

PROSPEROUS.—The *New Age*, edited by Frank B. Austin, and published by the Odd Fellows' Publishing Co., is now in its sixth volume, and, we are pleased to learn, enjoying a large circulation, betokening permanent prosperity.

Legislative.

In the State Legislature, several measures of general interest have been proposed. Senator Betge offered a resolution in the Senate, January 27th, to the effect that the Legislature should instruct Senators and Representatives to endeavor to get the government to grant a liberal subsidy for a monthly mail service between San Francisco and Melbourno. Undoubtedly, by the establishment of such a line, great advantages would accrue to the city and State.

The same day, Senator Lowis introduced a bill to promote the farming interests of the State, and to provide for the exportation of California produce free of port charges. This is to be accomplished by granting to the "Farmers' Wharf and Dock Company" a large tract of submerged land at this city, for wharf, dock and commercial purposes, where vessels loading with California products are to be free from wharfage or dockage. We have not been able to get the whole bill, to see exactly how this thing is to be managed.

Mr. Maclay introduced a bill to encourage the production and manufacture of sugar in California. The bill provides that a sum of three cents per pound shall be paid by the State for any lots of 10,000 pounds of good marketable sugar made from products of the soil in this State during the next three years after the passage of the bill, provided the amount of premium shall not exceed in the aggregate $25,000.

Mr. Williams introduced a bill in the Assembly for the relief of mining counties, looking to the donation by the national government of the mineral lands to the State, to be held in trust for the several counties, and to the sale of these lands for the payment of county indebtedness; any surplus remaining, after paying the counties' indebtedness, to be given to the General School Fund. It would be well for the State could it get the lands presented to it, but we fear the matter is rather impracticable.

A bill in regard to the trespassing of animals upon private property passed the Assembly, but has not yet been printed.

A couple of bills, amending the law regulating the management and sale of swamp, tide and other lands, have been introduced into the Senate; and bills for the protection (?) of quartz miners (providing that mines over 200 ft deep, shall have 2 shafts, at least 200 feet apart, for the safety of the workmen in case of fire or other accident), and also of farmers in certain portions of San Diego, into the Assembly.

The Commissioners appointed by the last Legislature to report on the practicability of making a new outlet for the flood waters of the Sacramento, have presented their report. They propose to cut a canal, which will relieve the river of a portion of the flood at high water, and also drain the district on that side of the river, from the bend, about midway between its junction with the Feather and Knight's Landing, down to Suisun Bay; also a canal to drain the lands, on the other side of the bend, into the river; and to levee the Feather and Sacramento rivers. The total cost of these and the other complimentary works is estimated at about two and a half millions; the total number of acres as 500,000; hence the cost per acre would be about five dollars. The effect of these works would be the reclamation of the whole of the Sacramento swampland delta, except that portion lying below the mouth of the American river on the east side, which would be greatly benefited. The land owners favor action, and ask no pecuniary aid from the State, and no assistance, except legislation, to enable them to levy a tax on the lands to be benefited, and collect the same as the work progresses.

◆

THE ARTESIAN WELL at Oakland has been carried down 300 feet, and has at this depth struck bedrock.

The Sale of Mineral Lands.

The bill of the Hon. Mr. Sargent on this subject seems to meet with approbation from the majority of people on this coast, as expressed through the different newspapers. We publish in another column, however, a letter from El Dorado county, in which the opposite opinion is expressed, and in which several points are made which are well worth the attention of our readers, and which gives the ideas of many miners, whose opinions demand careful consideration.

The principal objections to the bill in question seem to be, that this policy will concentrate the mineral lands in the hands of the few wealthy speculators; that it will interfere greatly with prospecting; that it will materially damage mining operations by interfering with canals, ditches, etc.; and that it will render it an easy matter to levy black-mail or "freeze out" honest miners in the manner described by our correspondent.

The advocates of such a measure, on the other hand, urge that, by securing to people the titles to their lands, they will settle permanently and develop the resources; the impoverished condition of the mining counties being chiefly due to the want of security of title; and that it will put an end to the bogus mining claims held by persons who never have done, and never intend to do, any permanent work on them, but levy a tariff on the real worker and cripple the resources of the country.

We believe that some change is urgently demanded, and that our existing laws must be modified or changed to a considerable extent. It is, however, always a matter of great difficulty to say exactly how and what changes ought to be made, and the matter should be thoroughly discussed and ventilated before any measure on the subject is made a law.

We are inclined to favor some such measure as Mr. Sargent's, believing that the result will be to build up and enrich many localities which are now decaying. If a person once becomes a confirmed owner of land which he has considered valuable enough to purchase or preëmpt, he will develop this land to a higher degree than is done under existing laws, and instead of the hasty and wasteful manner of working claims, which has hitherto obtained to a great extent, this will be done more slowly perhaps, but certainly more carefully and more thoroughly, and hence will inure greatly to the benefit of the State.

In regard to speculators, there seems to be a great diversity of opinion, one party claiming that the bill assists, the other that it hinders their operations. So much, we think, is certain, that it will prevent their locating and holding claims for an indefinite number of years without doing any work upon them; and we would call notice to the fact that the bill provides that no location shall exceed 160 acres for any one person or association.

But while, in general, in favor of Mr. Sargent's bill, we still think it capable of improvements in several particulars. For instance, there should be more protection given to the miners. The right of way for canals, ditches, sluices, etc., should be granted in such a way that no honest man should be prevented from working his claim, and that black-mailing should be rendered impossible.

In regard to prospecting, it should also be noticed that the bill provides only for mining titles, and the claimant must have expended in actual labor and improvements an amount of not less than $1,000, so that unimproved lands are still subject to the prospector and miner, as in the original bill.

On a careful review of the bill, we think that many objections will be found to be only apparent, while several improvements can still be made. We have not space to treat more fully on the subject in this issue, and have brought the matter up, principally, that the different views of those interested may be made public, and the various features be well discussed before any definite steps are taken. It is only by looking at all sides with impartiality and care, that we can hope to make laws which will not require unmaking, or being put in force.

Roasting Furnaces in Sonora, Mexico.

BY GUIDO KUSTEL.

[We received a call this week from Mr. Küstel, who has lately returned from a trip among the mines and works in Sonora. Mr. K. found things generally quite dull, owing, in great measure, to the unsettled state of the country. This status has continued so long and proved so fatal to many promising enterprises, that many there would like to see the country under the protection of the United States. This, it is thought, would lead to an immigration of a better class of people than the natives, and some respect would be had to life and property. Under the enforcement of proper laws in this respect, and with competent engineers to manage the works, there is no doubt but that investment in mines would prove immensely lucrative. A measure, which is of very great importance to miners, has been introduced into the Mexican Legislature, and very likely will become a law. This does away with the export duty of eight per cent. at present imposed on coin, and, if passed, will relieve the mines of a very oppressive burden, Mr. Küstel furnishes us with the following article:]

Editors Press:—Silver ores of Sonora, as a generality, require roasting. This preparation is necessary not only for the pan and barrel amalgamation, but in many cases also for the patio amalgamation. In the latter instance the roasting is not perfect, the object being to form chlorides and sulphates only to some extent; but the finishing of the chemical operation is trusted to the patio process. All roasting heretofore has been done in the old-fashioned single furnaces, having one hearth, capable of receiving 800 pounds of ore. Two men are employed at the same time at each furnace. The roasters are either Yaque Indians or Mexicans, who are good laborers but no skillful roasters. It is, therefore, of importance to construct furnaces by which a good result can be obtained independently of the skill or good-will or the roaster.

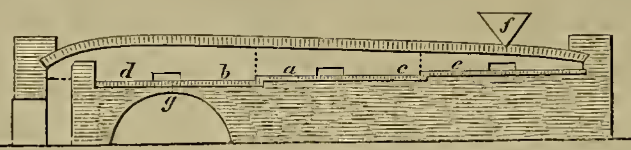

Fig. A.—Roasting Furnace, Accordino to Kustel.

Mr. Ottocar Hofmann, who was engaged to introduce the chlorination process on silver ores at La Dura, built a furnace of thirty feet in length, as recommended in my book on Concentration and Chlorination, page 237. This furnace represents—as Fig. A shows—three hearths in continuation; but, in order to make the workmen better understand where the charge for each hearth terminates, there is a step of four inches between each, so that the last one, where the charge is introduced, is eight inches above the level of the first hearth, *d*, *b*. Two men are generally sufficient—one at the finishing hearth, and the other to stir the ores, alternately, on the middle and on the last hearth. A light red heat is kept up continually in the first department, *d*, *b*, the ore requiring diligent stirring for two or, if it appears very rebellious, three hours. The roasted ore is then discharged through the hole, *g*, near the working door. The ore from the middle hearth is now shifted over to the first one, from *a* to *b*, and from *c* to *d*. The middle hearth, being thus cleared, receives the charge of the third from *e* to *c* in the same way, and this is then charged with fresh ore through the funnel, *f*. The discharging and moving of the ore from one hearth to the other is, by itself, a perfect stirring, and it cannot happen here, as is the case very often in single furnaces, that raw ore should remain in the corners of the hearth or some other place inconvenient for raking. It is also evident that a great deal less fuel is consumed. The low temperature with the beginning of the roasting in single furnaces, and the gradual increasing, requires more time and more fuel and a good deal of attendance—circumstances which are not met with in long furnaces. But also the chemical result deserves consideration. By reliable analysis of Mr. Graff it is ascertained that, comparing the result of roasting of the same ore, a sample of the single furnace contains twice as much unchloridized silver as that of the long furnace.

At Trinidad, Mr. O. Hofmann built another furnace, similar to that in La Dura. The advantage gained in both places by adopting long furnaces in place of the single ones, induced Mr. Graff to put up a like furnace at the San Martial silver works, where Yaqui Indians are employed in roasting. In consideration of their indifference as to the result of their work, Mr. Graff concluded to build his furnace 60 feet long, representing six hearths, with as many working doors. The length, however, requires a small additional fire place. Without question, a great advantage is found in moving the ore six times in six hours from one hearth to the other, discharging every hour. The ore, arriving at the finishing hearth, is most uniformly prepared, independent of the skill of the Indians, of which twelve are employed at one time, stirring alternately, carrying wood to the furnace, the ashes out of the *hacienda*, spreading the discharged ore over a large surface ground, in order to have it cooled down in course of an hour, ready to be transported to the sifting apparatus. This length of a furnace appears a local necessity; and, although in many respects advantageous, it requires, for the same amount of ore, double the number of roasters compared with a 30-foot furnace, where the ore is kept two hours on one hearth instead of one.

The roasting furnaces at Agua Caliente are also undergoing a change. Each two single furnaces will be combined to one, giving a hearth surface of thirty-five feet in length; and there is no doubt that, wherever in Sonora the pecuniary circumstances admit a change, the single furnaces will be replaced by long ones, and that this change will gradually spread into Chihuahua and Sinaloa.

Furnaces the hearth of which is large enough to receive a thousand pounds of ore, where the width of each hearth should be equal to its length at least, are easier to handle if working doors are made on both sides. This arrangement allows the use of lighter and shorter hoes and rakes, the roaster works with less exertion, and the floor of the hearth stands longer.

◆

Ætna Foundry.—Over thirty-six tons of iron were melted at this foundry last week. The proprietors now have orders for several Varney's amalgamating pans, and a large-sized Varney & Rix's rock crusher; an engine and hoisting works for the Joe Walker mine, Kern county. Amongst other work lately turned out, has been a quantity of Pendergast's superior white iron shoes and dies for stamp mills, and also iron works house-fronts.

We wrote a short time ago an item—which seems to have been lost between the editorial and printing department—concerning a large screw for a propeller which was cast at these works. This is the largest ever cast on the coast, we believe, and the work was done in the most excellent manner, the surface being almost as smooth and as free from flaws as if turned out by a lathe.

◆

Sorghum Sugar.—Mr. Purdy, the gentleman to whom we referred a week or two since, as engaged in some experiments near Gilroy, for the manufacture of sorghum syrup and sugar, has shown us several samples of sugar, which he has more recently produced. A small quantity only has been made, merely as an experiment; but sufficient to prove that we can both raise the plant, and make the sugar in California.

◆

View of the I. O. O. F. Hall.—On our first page is a very correct view of the Odd Fellows' Hall in this city, drawn and engraved expressly for the *New Age*, by the artist of the Scientific Press Office. As a work of art, it is highly creditable to the artist, and will compare favorably with, if not excel, much work of the kind in the Eastern States.—*New Age, Jan.* 1.

A Full List of Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending January 25th.

- **Mortising Machine.**—John Cox, Portland, Oregon.
- **Combined Harvester and Thresher.**—David Hallowell, St. Helena, assignor to himself and Charles A. Lowe, San Francisco.
- **Needle and Arm for Sewing Machine.** Mary P. Carpenter, San Francisco.
- **Smoothing-Iron Handle.**—Theodore Van Tassell and Richard Starr Pollock, San Francisco.

Reissue.

- Division A.—**Furnace for Roasting and Treating Ores.**—Charles Stetefeldt, Austin, Nevada.
- Division B.—**Process of Treating Silver Ores.**—Charles Stetefeldt, Austin, Nevada.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than any other agency.

◆

"C. H. A." vs. Others.

We have published quite a number of letters, which were drawn out by an article in our columns on "Rebellious Ores and New Processes," published last December, hoping thereby to elicit some facts of interest on points where light is needed, and not for the purpose of ventilating mere generalities of opinion. The subject seemed certainly to interest many of our readers, for we have received more letters than we could publish. We think that some of the writers, however, do not view the matter fairly.

The points in the article in question which seem to attract special notice, are the remarks on "practical men," on "doctors," and on "new processes." In regard to the first two, we think there is no further need of discussion, as it is to be understood thereby that those who put themselves forward as preëminently practical or scientific, without having the proper qualifications, are intended. On this point all agree practically with the writer. Pretenders cannot be handled too roughly. The deduction that *all* practical men are underrated, is very unjust, as no such conclusion can be drawn, in fairness, from the article.

In regard to new processes, "C. H. A." is also right in a great measure. All of the more important principles of metallurgy, as practiced on our coast, have long been known. Many persons, from want of information, have tried, or even invented, many different things, which have been proved elsewhere long before. Our chief need is the proper *application* and *modification* of old processes. And before we can expect new inventions of importance, we must have trained engineers of skill and experience, who may benefit by the labors of others, and thus be able to turn their exertions to better profit.

The value of a thorough education is becoming more and more apparent every day. The first point desirable to be gained is the knowledge of what has been done in our profession in other parts of the world, and the deductions from these facts constitute theory. If our inventors only studied what others have done before them, and saw thereby what was to be avoided and what grappled with, they would save themselves an infinite amount of unprofitable labor. Now this is by no means a discouragement to their efforts; it should, on the contrary, be a stimulus. If they have been able to do as well as they have done without the benefit of others experience, it may reasonably be expected that they will make great advances when they receive this benefit by education.

It is with the purpose of extending desired information to those who are unable to go to other places to get it, that we invite miners and millmen to write us about the processes carried on at their special works. In this way, each can see what others are doing, and the benefit will be mutual. We are always glad to hear from our readers, and will notice all that is worthy of consideration.

WHEN TO PAY OFF—A SLANDER REFUTED.—The English are very much exercised on the question of the time at which wages should be paid off to workingmen. The question is said to grow out of the fact that a large part of the payments made on Saturday is spent in dissipation on Sunday; whereas, in a few places where paying off on Monday has been introduced, the result is much better. It is acknowledged, as a matter of frequent occurrence in that country, that large mechanical establishments which pay off on Saturday are unable to start on Monday, because the laborers do not get over their Sunday's spree in time to be fit for work the next day. No such charge has ever been brought against American workmen; yet drunkenness is frequently spoken of by our own people, as well as foreigners, as a national vice in this country. We think the above acknowledgment fairly entitles our British cousins, if either, to that distinction—if distinction it may be called. American mechanics, as a class—natives of the country—are probably as free from the vice of drunkenness as any other nationalty on the globe, and we hold the charge above referred to, so frequently made, as a malicious slander upon American nationality.

* * *

THE AMOUNT OF WATER excreted by the kidneys varies. It is estimated at about 30 ounces in summer, and at 40 in winter for a person who drinks only what nature requires. From the skin is excreted in ordinary circumstances, from 1¾ to 5 pounds in 24 hours, and in extraordinary cases, as of glass-blowers, etc., it has amounted to 16 or 20 pounds. We require, therefore, from 4 to 12 pounds of water daily, to keep all the organs and functions in healthy working order.

* * *

THE RANGE OF TEMPERATURE in which men live is from 130° above to 70° below zero—200 degrees. Workmen in furnaces are accustomed, in some places, to enter a room when the floor is red-hot and the temperature of the air stands at 350°. The "Fire-King" Chariot was in the habit of entering an oven at a temperature of 400° to 500°—which would crisp a steak to charcoal.

THE Scientific Press, of San Francisco, formerly the Mining and Scientific Press, the first number of which for 1870 we have just received, comes to us much improved in appearance. With its new title it has increased the reading space of its columns, introduced a farming and gardening department, and still retains the popular features of mining reports from the different States and Territories, and editorials and communications on subjects allied to mining. In short, the Scientific Press is a first-class California publication, an ornament to a State renowned for the number and excellence of its newspapers.—*Colorado Miner, Jan.* 13.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

I. O. O. F.

THE NEW AGE,

A WEEKLY JOURNAL OF SIXTEEN PAGES.

The "Official Organ" of the I. O. O. F. on the Pacific Coast.

Is devoted to Odd Fellowship, the ARTS AND SCIENCES and GENERAL LITERATURE; and as a family paper is not surpassed by any journal in the United States. Subscription price per year by mail, $5. Delivered in the city, per month, 50 cents. Office, Odd Fellows' Hall, 327 Montgomery street, San Francisco. 19v19

Kustel's Treatise on Concentration of All Kinds of Ores,

Including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally. Illustrated with 120 Diagrams on 7 Plates.

CONTENTS:

I.—INTRODUCTION.

1. The Dressing.—Dressing of Ores; Principles of Dressing; Division of Dressing.
2. The Separation.—Separation of Gangue from Ore in the Mine; Dressing of Ores outside the Mine; Separation by Hammers; The Ragging; The Spalling; The Cobbing; Separation by Hand; The Picking.
3. Cleansing and Sizing Contrivances.—Washing and Sizing; Stationary Apparatus; The Sluice; The Kiln; The Step Sluice; Movable Machines; The Hand Riddle; The Rocker; The Circular Hand Riddle; Swinging and Jarring Riddles; The Jarring Riddle.
4. Rotary Sizers.—The Trommel or Drum; Cylindric Trommel; Prismatic Trommel; Conical Trommel; Combined Trommel; The Sifting Wheel; Sizes of Grains for Jigging.

II.—REDUCTION.

1. Reduction of Ores.—Reduction of Ores to a Proper Size; Breaking under Heavy Stamps; Reduction by Rock Breakers; Hanscom's Crusher; Blake's Quartz Breaker; Reduction by Stamps.
2. Description of Batteries.—The Foundation; Mortar Blocks; Frames; Iron Frames; Howland's Rotary Battery; The Straight Iron Battery; Bryant's Battery; Wright's Iron Battery.
3. Details of a Battery.—The Mortar; Stem or Lifter; Shoe or Pestle; Socket or Head; Tappet; California Tappet; Cams—Wooden Cams; Iron Cams.
4. Speed, Curve and Order of Lifts.—Limit of Speed in Crushing; Construction of the Cam Curve; Order of Successive Stamp Lifts; Hanging-up of Stamps.
5. The Discharge of Batteries.—The Discharge in Dry Crushing—with Grates; without Grates; with Sieves; Dust Chambers; The Discharge in Wet Crushing—the Grates and Screens.
6. Feeding of Batteries.—Hand-Feeding; Stationary Hoppers; Movable Hoppers; Quantity of Water for Crushing; Remarks on Speed and Weight of Stamps.
7. Reduction by Rolling Mills.—Construction of Rollers; The Frame; Feeding of Rollers; Remarks.
8. Grinding.—The Arastra or Tehama; The Edge or Chili Mill; Ball Mills; Lundgren's Pulverizer: Cylinder Mills; Ferrand Mill; Hopkins' Grinder; Horizontal Mills; Iron Pan Grinders.
9. Pans with Plane Mullers.—The Common Pan Grinders; Tub Grinder; Bartolo's Grinder; Knox's Pan; Varney's Pan; Wheeler's Pan; Union Grinder; Moore's Quartz Grinder; Gaston's Grinder.
10. Pans with Conical Mullers—Hepburn & Peterson's Pan; Belden's Pan; Baux & Guiod's Grinder.
11. Pans with Tractory-Conical Mullers.—Excelsior Pan; Wheeler & Randall's Pan; Excelsior Continuous Grinders.
12. Pans with Perpendicular Mullers.—The Centrifugal Ore Grinder; Varney's Quartz Grinder.

III.—CONCENTRATION.

Concentration of Reduced Ore.—Division.
A. Concentration of Ore Grains (Jigging Stuff).—The Principle; The Jigging.
2. Movable Jiggers.—The Movable Jigger.
3. Stationary Jiggers.—Hydraulic Jigger; Petherick's Separator; Stationary Jigger.
4. Continual Jiggers.—Percussion Jigger, Setz Herd); Continual Cylinder Jigger; Continual Jigger; Hydraulic Continual.
5. Rotary Machines.—The Rotating Cylinder (Strom-setz Maschine); Rotating Wheel (Setz-Rad); The Dolly Tub; Auferman's Dry Jigger.
B. Concentration of Ore Sands and Slimes.
6. Assorting of Sands.—The Labyrinth; Borlace's Slime Separator; Ph. Hofmann's Separator; Rittinger's Funnel or Pointed Box; Rittinger's Spitz-Lutte.
7. Feeding of Concentrator.—Feeding-Boxes; Stationary Feed-Box; Rotating Feeder.
8. Stationary Concentrators.—Hand Buddle; Sleeping Table; Rack; Sweeping Tables; Round Buddle; Concave Buddle; Blanket Tables.
9. Percussion Tables.—Percussion Tables; German Percussion Table; Continual Percussion Table; Hunter's Continual Percussion Table; Varney's Percussion Buddle.
10. Oscillating and Shaking Tables.—Borlace's Concentrator; Hendy's Concentrator; Hungerford's Concentrator; Barron's Concentrator.
11. Steady Moving Concentrators.—Concave Rotary Buddle; Convex Rotary Buddle; Burton's Table; Self-Discharging Blankets; Horizontal-Moving Blanket.

IV.—SPECIAL CONCENTRATION.

1. Concentration of Gold Ores.—Concentration of Gold Ores; Amalgam of Gold Quartz; Amalgamation and Grinding; Combined Concentration and Amalgamation; Treatment of Concentrated Stuff.
2. Concentration of Silver Ores; Concentration Works; Cost of Concentration; Concentration of Tailings.
3. Concentration of Lead and other Ores.—Concentration of Lead, Copper and other Ores; Value of Ores for Concentration.

V.—CHLORINATION.

Extraction of Gold from Sulphurets or Arsenicials by Chlorination; Assay of Gold Sulphurets by Chlorination; Chlorination Process for Sulphurets; Loss of Gold in Roasting; Single Roasting Furnaces; Double Furnaces; Mechanical Furnaces; The Roasting Operation; Roasting with Salt.

Chlorination.—Damping of the Roasted Ore; Sifting; Production of Chlorine Gas; Lixiviation; The Precipitating Vat; The Precipitation; Cost of the Chlorination Process per ton of Ore; Remarks.

Other Methods of Dissolving and Precitating the Gold from Sulphurets.—Chlorination at Reichenstein; Chlorination at Schemnitz; Calvert's Method for Auriferous Quartz; Extraction of Gold, Silver and Copper.

PRICE, - - - - - - $7.50 per copy.

Sent by mail, and sold wholesale and retail by DEWEY & CO., publishers, office SCIENTIFIC PRESS, San Francisco.

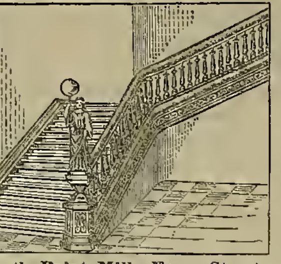
STAIR



BUILDERS.

South Point Mills, Berry Street,
Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins. Fancy Nowels and Balusters.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

CAUTION AGAINST FRAUD.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-1yeow

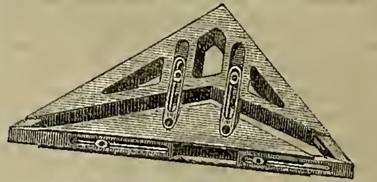
THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

To Carpenters and Stair Builders.



Drew's Patent Extension Pitch-Board

Saves TIME, LABOR, and LUMBER, and secures exactness and perfect work. This is a very simple instrument, which is quickly and easily adjusted (as may be seen by the engraving), so as to give any desired pitch and tread for stair building. It is adjusted by a system of slides and screws. Full information may be obtained of the inventor, JOHN R. DREW,
5v20 Cor. Natoma and Fifth streets, S. F.

The Scientific Press,

Devoted to SCIENTIFIC AND MECHANICAL PROGRESS, MINING, FARMING AND MECHANIC ARTS, contains more VALUABLE READING MATTER than any other weekly journal west of the Rocky Mountains. It is the best printed and only finely-illustrated paper on the Coast. Its articles are able, timely and reliable, and written in a more interesting and easily comprehensive style than scientific papers in general. Now in its twentieth volume, it is printed on superior paper, containing sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe. All our best citizens are interested in the new discoveries in the development and progress of the three great industrial pursuits named above, which are closely allied on this coast, and are jointly represented in the PRESS, rendering it a popular and influential journal with all industrial readers. Subscriptions reduced to $4 a year, Jan. 1, 1870.

To Inventors on the Pacific Coast.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in *all civilized countries.* The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

ENGRAVING ON WOOD, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

DEWEY & CO.

International Hotel,

JACKSON STREET,

BETWEEN MONTGOMERY AND KEARNY STS.,

SAN FRANCISCO, CAL.

THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stop at. The Beds are new and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.

Prices varying from $1 50 to $2 per day for Board and Room.

FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.

☞ Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for 50 cents
21v12 F. E. WEYGANT. Proprietor.

The Aerial Steam Navigation Company.

At a meeting of the stockholders of this company, December 17th, 1869, Messrs. Eugene Sullivan, Thomas N. Cazneau, Henry F. Williams and Simon L. Jones were appointed a committee to receive subscriptions for one thousand shares (one-tenth of the capital stock of the company) at the rate of ten dollars per share of the par value of one hundred dollars, said shares to be *unassessable.* The funds thus raised are to be devoted exclusively to the construction of the first aerial steam carriage, and to be deposited in the Bank of British Columbia, to be disbursed upon requisition of Mr. George K. Glnyas, Engineer of Construction. The working, drawings, etc., can be seen at the office of Gen Thomas N. Cazneau, No. 321 California street, where subscriptions will be received. No invention for navigating the air has before received such positive indorsements from engineers of reputation, or so liberal encouragement from prominent capitalists as Marriott's Avitor, which now seems sure of being thoroughly tested on a large scale. 2v2-my

Advertising and Subscription Rates for the Scientific Press.

SUBSCRIPTIONS IN ADVANCE:—One year, $4; six months, $2.50; single copies, 10 cents; Monthly Series, $4.50 per annum; Quarterly Series (stiff paper binding) $5.

Lowest Rates for Advertising:

We shall adhere to the following rates (payable in gold coin) for advertising in the SCIENTIFIC PRESS from this date:

	1 week.	1 month.	3 months.	1 year.
One sq. (10 lines agate)	$1 50	$ 3 00	$ 8 00	$ 32 00
Two squares	3 00	6 00	15 00	60 00
Three squares	4 50	9 00	20 00	76 00
One-fourth column	6 00	12 00	28 00	100 00
Half column	12 00	20 00	54 00	200 00
One column	20 00	40 00	100 00	400 00

RATES BY THE LINE.

Per line.—One week, 25 cents; one month, 80 cents; three months, $2; one year, $5.

Per line, ten lines or more.—One week, 20 cents; one month, 30 cents; three months, 80 cents; one year, $3.20,

MINING AND LEGAL ADVERTISEMENTS will be inserted at special rates—less than one-half the cost of daily publication.

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form. We will otherwise assist advertisers in getting up their notices, when desired.

☞ All advertisements in the PRESS appear in both the
☞the MONTHLY AND QUARTERLY SERIES of the SCIEN-
☞TIFIC PRESS, which (by special arrangement) are
☞placed for FREE READING in the principal hotels,
☞steamboat and steamship saloons, depots, and pub-
☞lic reading rooms and libraries in San Francisco and
☞Pacific States. Many volumes are also bound, thus
☞affording permanent advertising.

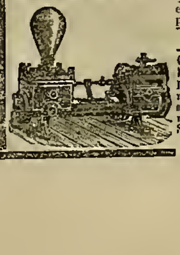
The PRESS now receives the largest and best advertising patronage of ANY WEEKLY PAPER west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—*our advertisers*. Better referees, or more reliable names, cannot be found in the advertising columns of any newspaper in the world.

DEWEY & CO.,
Publishers and Patent Agents.
No. 414 Clay street, San Francisco. Jan. 1, 1870.

FROM $65 The WEED Sewing Machines—the WHOLE WORLD being judges—as they are the LAST, so also are BEST! Why? Because the WEED Machines work easier, simpler, faster and with more VARIETY. Buy the LATEST always. Call and see S. E. Hoar, 329 Kearny St. S. F., Agt. TO $500

Blake's Patent. THE BEST PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's



Patent Steam PUMP

It is SIMPLE, COMPACT and POWERFUL, needs no expert to run it, and will start at any point. Is warranted POSITIVE under all circumstances. Send for a circular.

STEAM FIRE-PROOF SAFES

SANBORN'S PATENT.

Perfectly Dry in Use.

ACTUALLY FIRE-PROOF.

GET THE BEST.

The remarkable fire-proof quality of these Safes has been fully demonstrated, having been subjected to severe practical tests with the Safes of all other prominent makers, and always with complete success, preserving its papers while the contents of its competitors were destroyed. A practical man needs but to examine them to be convinced of their superiority.

☞Burglar-proof work, welded iron and steel, Sargent & Greenleaf's Magnetic and Automatic Locks. For sale by

ROSS, DEMPSTER & CO.,
105, 107 and 109 California street,
San Francisco.

MARAVILLA COCOA.—*For Breakfast.*—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 6v20-1y

Metallurgy.

Metallurgical.

The undersigned respectfully announce to the public (especially to parties interested in mining) that they have opened an office at

No. 36 FREMONT STREET,

And WORKS at H. J. BOOTH & CO'S FOUNDRY, northeast corner First and Mission streets, San Francisco, where Ores in small or large quantities of all kinds can be worked by Pan Amalgamation, Chlorination or Smelting, and all kinds of Assays and Analyses made. We will also sample any Ores entrusted to our care; and in all cases returns made in the shortest time possible. We will give consultations on the best methods of successfully working Sulphurets or Refractory Ore.

Drawings Furnished for Quartz Mills, Smelting and Chlorination Furnaces.

By having had long practical experience in working Gold, Silver, Copper and Lead Ores, we hope thereby to get a share of the patronage of the mining public.

☞ Mines Examined and Reports made.

507 MECHANICAL MOVEMENTS.

PUBLISHED BY

DEWEY & CO.

LIST OF CONTENTS.

Æolipile.

Balance, Compensation: Barometer; Blower, Fan; Brake, Friction.

Cams; Capstans; Centrolinead; Clutches; Chasers; Clamps, bench and screw; Cock, four-way; Column, oscillating; Compasses, proportion; Counters of revolutions; Coupling, union; Crank—substitute for the, variable; Cranks, bell and compound; Cyclograph.

Differential Movements; Drag-link; Drill—Fiddle and Persian; Drills, Cramp; Drop; Drum and Rope; Driver, Pile; Dynamometers.

Eccentrics; Ejectors, Bilge; Ellipsograph. Engine, Disk; Engines—Rotary, Steam, Valve Gear for; Epicyclic Trains; Escapements.

Fountain, Hiero's: Fusees.

Gasometers; Gauge, Bisecting; Gauges, Pressure; Gear, Steering; Gearing—Bevel, Brush, Capstan, Conical, Crown, Eccentric, Elliptical, Face, Friction, Internal, Irregular, Multiple, Mutilated, Scroll, Sector, Spur, Step, Stud, Sun and Planet; Gearing—Variable, Worm; Governors; Guides; Gyroscope.

Hammers—Atmospheric, Bell, Compressed Air, Trip, Steam; Helicograph; Hook—Boat-detaching, Releasing; Hooks, Centrifugal Check; Hyperbolas, Instrument for Drawing.

Intermittent Movements.

Jack—Hydrostatic, Lifting; Joint—Ball and Socket, Bayonet, Universal.

Ladder—Folding, Self-Adjusting; Lazy-tongs; Level, Self-recording; Lever—Bell-crank or Elbow, Knee; Lewis; Link. Detachable Chain.

Machine—Bohnenberger's, Drilling, Polishing, Punching, Warp-dressing; Main, Flexible Water; Maintaining Power; Meter—Gas (wet and dry), Water: Mill—Barker's, Crushing, Tread, Wind; Miscellaneous Movements; Motion—Alternating Traverse, Rocking, Self-reversing, Shuttle; Motions—Feed, Link, Parallel, Pump, Traverse, Variable Traverse.

Pantograph; Parabolas, Instrument for Drawing; Paradox, Mechanical; Pendulum, Conical; Pendulums, Compensation; Pinion—Lantern, Mutilated, Slotted, Two-toothed; Power, Horse; Presses, Hydrostatic; Propeller, Screw; Pulley—Expanding, Friction: Pulleys—Anti-friction Bearing for, Chain; Pump—Air, Balance, Bellows, Chain, Diaphragm, Steam-siphon; Pumps—Double-acting, Force, Lift, Rotary; Punching Machine.

Rack—Mangle, Mutilated; Racks and Pinions; Ram, Montgolfier's Water; Ratchets and Pawls; Regulator—Gas, Watch, Reversing Motion, Self; Revolver; Rollers, Oblique; Rolls—Anti-friction, Drawing, Feed; Rulers, Parallel.

Saw—Endless Band, Gig, Pendulum; Screw, Archimedes, Differential, Double Reversed, Micrometer; Screws—Endless, Right-and-left Hand; Sectors; Seesaw; Shears; Stamps; Stand, Mirror; Stop—for Hoisting Apparatus, for Lantern Wheels, for Ratchet Wheels, for Spur Gear; Stops for Winding Watches.

Test, Friction; Throttle, Spinning; Toggle-joint; Tongs, Lifting; Trap, Steam; Treadles.

Water, Machines for Raising: Weir, Self-acting; Wheel Cam, Lantern, Persian, Pin, Rag, Sprocket, Steering, Waved; Wheels—Crown, Mangle, Paddle, Water; Windlass—Chinese, Friction; Windmills; Wipers.

This book is bound in cloth, and embraces 122 pages. The illustrations are plain, and each figure is clearly described on the page opposite to it. It is a low-priced book for its kind, and there are few persons who have to do with machinery, or are interested in understanding the science and principles of motion, who will not be benefitted and satisfied by its purchase.

A liberal discount made to the trade. Single copies, $1—sent postage free. Address orders,

DEWEY & CO.,
Patent Agents, San Francisco.

Reading for the Hour.

Alaska.

The reports made by different persons concerning our newly acquired Territory vary very considerably, some representing the resources and prospects in glowing colors, others giving a rather gloomy picture. The weight of authority, however, seems to lie principally on the side of those who give the less promising views, and unless we have better authenticated reports on the other side, we must follow these opinions. That is to say, while not believing that the place is worthless, we incline to the idea that it will not result as a *very* valuable acquisition, but one which will cause us considerable trouble and expense. H. H. Mc Intire, late special agent of the Treasury Department for Alaska, gives the following with regard to the cost and value in his report which has just been sent to the Senate:

The price paid, namely $7,200,000, is only a small item of its cost to the United States. Assuming that the public debt will not be paid within twenty-five years, the interest on that sum will be $24,000,000, additional; to which must be added the expense of the military and naval establishments—say $500,000 per annum, or twelve and a half million in twenty-five years; resulting in a grand total cost, on this basis, of $43,000,000. In return for this expenditure we may hope to derive from the seal fisheries, if properly conducted, from $75,000 to $100,000 annually, and from customs $5,000 to $10,000 per annum, nor can we look for any material increase of revenue for many years, except in the event of extraordinary circumstances, such as the discovery of deposits of valuable minerals sufficiently large to induce an influx of population.

Others claim that the revenue from the seal skins and the fisheries will much more than repay the purchase-money; but this is rather an indefinite statement, which does not cover the whole ground. We wish to know if Alaska will not only pay back the money invested with interest, but also support itself hereafter without costing the Government large sums. It seems as if there was great danger of the discontinuance, at no very distant time, of these revenues, while the Government expenses will still continue. And, outside of the seal trade and the fisheries, there seem to be very few inducements to cause people to settle in the land. Very high bids have been made, it is said, for the monopoly of the fisheries and the lease of the fur-seal islands. But under such leases, unless proper restrictions—which would diminish greatly the value of the bids—are made, there is danger of the animals being all destroyed or driven off. We wait, however, for fuller information.

A telegram from New York reads thus: "A new disease, heretofore a stranger to this country, has broken out in this city. It is called the relapsing fever. It has been quite common in Europe. Though very violent in its symptoms, it is not attended with great mortality. Several cases have been detected in the hospitals." The only new part of the thing is the name. The disease itself is common enough everywhere. The symptoms are somewhat as follows: On getting up about noon, violent headache, feeling of uneasiness in the region of the stomach, general disinclination to any exertion, disgust with all the world, strong desire for cold water, redness of the eyes, grand determination not to take any more. Symptoms grow weaker in the afternoon; idea that a cocktail would be beneficial under the circumstances grows stronger and stronger until evening, when comes the relapse. We are very sorry that the hospital surgeons (according to the telegram) are suffering from this disease; it looks very bad. Army surgeons, we know from experience, are very liable to attacks.

How Matches are Made.

Cutting the Splints.

The planks or pieces of wood for making matches are cut into slips, four feet in length and two inches in thickness. These are taken to a machine to be cut into slabs the exact thickness of a match. Formerly fine circular saws were used to accomplish this work, but have been rejected in favor of the present machine, which splits off the slabs by a motion similar to the eccentric of a steam engine, or a pushing stroke. This is a saving of 40 per cent. in timber, there being no waste by sawdust. The slab is then ready for the machine which is to cut it into splints. The action of this is simply the revolution of a solid iron cylinder, about three inches in diameter, on which is a series of 18 minute knives exactly distant the width of a match. The slab is cut half through on one side and then on the other, and in fifteen seconds, eighteen splints, four feet in length, and capable of making twenty-four matches each, are turned out.

These splints are put in bundles of 1,400 each and then cut, without unbundling, and with one movement of a guillotine, worked with a treadle, into lengths of four inches, or twice the length of a match, this length being kept for the purpose of dipping both ends by one process. From this cutter they go to the hands of the tiny creatures who fit them into frames for dipping—children scarce large enough to reach the tables at which they work. The frames are simply two uprights, secured by a cross piece at the bottom, and having grooved slides which hold the matches just far enough apart to keep them from touching, and their ends protruding.

Dipping.

At each dipping-furnace are two workmen. These furnaces are kept at a high heat, and upon them stand, first, an iron plate with nothing upon it; second, a pan of melted sulphur; third, another iron plate on which is the phosphoric composition which produces the light, which is kept always at the consistency of thick cream. The dipper takes the frame and puts it for a second or two upon the first hot plate, and then reverses it. This is done that any lingering moisture which may be in the wood shall be dried out. Then, by one dexterous movement, it is dipped in the sulphur, which hardens immediately, reversed as before, and then dipped in the phosphoric composition. The frame goes into a rack for drying, and in about two hours, unless the weather is very heavy and damp, the matches are ready to be taken out.

Boxing and Packing.

The matches, being taken from the frames, are transported to the packing room. Here they are taken in charge by girls, who show a wonderful dexterity in the manipulation. One, whom we watched, took up the loose matches—it being understood that they are yet double—cut them into two by means of a treadle cutter, and put them into their boxes, putting on the lids, at the rate of four hundred boxes an hour. In taking up these matches, such was the accuracy of touch that she never took more nor less than exactly the number required to fill the box, without leaving room for even one more. These boxes are then packed in packages of one and a half dozen boxes, or eight packages to a gross. The gross sells for $2.50. The boxes are retailed at the rate of 2¼ cents each.

Health of Workmen.

Each and all, workmen and children, declared themselves in perfect health. The dippers had good color, undoubtedly from the heat of the furnace; their muscles were as firm as in the generality of men who do not work at heavy labor; the tongue was somewhat furred, and the eyes bloodshot, but whether from phosphorus or something in a more liquid condition, we will not say. One had been three years dipping; the other, one. Those physicians who have looked into the matter in Europe declare that, after a year in this service, the workman is subject to a disease of the jaw—a crumbling of the bone, which defies all attempts to stop it until the jaw drops off. To avert this, manufacturers have undertaken to introduce a new kind of phosphorus, denominated by chemists, amorphous or allotropic, but, so far, the effort has been unsuccessful.—*Lippincott.*

The Cardiff Giant.—The Chicago *Tribune* gives what purports to be the history of the statue, showing that it was made in that city by a German workman, who executed the job in twenty days.

Impressions of California.

We picked up a book—an old acquaintance—the other day, and were amused at reading again the descriptions of California in the pioneer times. The book was Gerstaecker's *Journey Round the World;* and as it is quite the custom now to write a book on one's impressions on seeing San Francisco, we copy the author's account of the impressions of some of the "new-comers" in '49 in landing from the ship:

The astonished, on the other hand—and the landing swarms with them—are those who find themselves suddenly obliged to work here because no one will do it for them, while a simple errand costs as much as they paid for a month's service in the old country. They have read about such a state of things existing in California as they really find it; but believed it with a face, as if they were going to say, "Oh, you're only joking," and now find themselves, to their utter dismay, in a scrape, and don't know exactly how to get out of it. They stand upon the shore of this most singular country, with their trunks, boxes, chests and other things around them, and nobody seems to care the least in the world about them or about their trunks. As other boats are pressing in, and want room on the landing for their baggage, they must move, and at it they go at last, to toil up the steep banks in the sweat of their brow. They do not pull off their coats; for they would be ashamed to show themselves in the streets in shirt sleeves, and every twenty yards, or as soon as they meet any body, they set down whatever they are carrying, wipe their red-hot faces, and ask the man, who looks to them very much like a laborer, to take their baggage to a hotel, looking with great astonishment after the "free and independent individual," who, most likely, told them to "do it themselves, if they wanted it done." They have torn their dress coats, and knocked their silk hats into all manner of shapes; and these are the men who stop at last on the top of the bank, setting on their own trunk which they have carried up here, and wiping their faces, perhaps, with an embroidered handkerchief, murmur reproachfully—"and this is California."

The Vacuum Method for Making Ice.—An ice-producing machine has been invented, the action of which is based on the principle of producing cold by the expansion of atmospheric air, which has been first condensed by means of mechanical power. The machine requires no chemicals, nothing being used in them but water and atmospheric air. They may be worked by steam, water, or wind, and they produce from 100 to 1,000 pounds of ice per hour, according to size, at a cost of from 5 to 10 cts. per 100 lbs., this difference resulting from the varying prices of fuel and the mode of working chosen. They may also be employed to cool rooms, cellars, theaters, hospitals, compartments of ships, etc. The principle of the operation of these machines is the same which often gives so much annoyance to miners who ventilate their mines by forcing in air through long pipes. The pressure under which this is often done leads to such an expansion at the outlet of the pipe that ice often accumulates so rapidly as to completely close up the outlet, or, at least, greatly impede the egress of the air.

A Gigantic Leaf.—A plant has lately been discovered in Nicaragua which produces but a solitary leaf; but this one, with its leaf stock, grows fourteen feet long. The fact of this wonderful plant having been discovered so near our own territory, and by an English botanist, should operate to stimulate the botanical societies of the United States to make some little exertion in finding out what there is on our continent worthy of notice. We have millions of dollars to squander upon things which are of no earthly use to our people, but not a cent to devote to science.

Live Quails are to be shipped from southern Illinois to Colorado, where it is thought they will thrive and increase for the benefit of sportsmen.

Hints and Recipes.

Claret Sauce.—Take cranberries or, when they cannot be obtained, dried apples, and stew till well cooked in a tin-lined or porcelain dish; stew also one teacup full of *dried* raspberries to one gallon of apples or cranberries; when done, mix and sweeten to the taste, and let the whole come to a boil. When the apples are cold and of a claret color, they have the flavor of the raspberry. Such a sauce will please even an epicure.

Earwigs Harmless.—It is an unfounded popular prejudice that ear-wigs get into the brain by creeping into the ear; for though, from being insects and disliking exposure to the light, they may, by chance attempt to take shelter in the ear, the disagreeable odor of the wax will soon drive them out; at all events, they could never get further than the drum, which completely shuts the passage to the brain. We have known, indeed, a small beetle to get into the ear, but it did no further injury than produce a tingling sensation by crawling about the drum, and soon made its exit. A little red insect (the harvest bug) sometimes gets into the ear in bed and produces wonderful commotion, but no real injury.

Headache.—Sulphide of carbon is said to be an excellent remedy against headache, especially when it is of the neuralgic or nervous character. It is used by placing a wad of cotton saturated with this liquid in a bottle, and applying its open mouth to the temple or part affected. The pricking sensation which is at first experienced is soon followed by relief from pain.

Deceived the Rats.—Milton Merrifield, of Providence, caught fifty-two rats in one night by exchanging a barrel of oats, that had been often visited by rats, for one of water, covering the surface with chaff. The "varmints" unsuspectingly pitched in, and met a watery grave. This is an old but excellent trap where these animals are plenty.

Cherry Bounce.—Stew your cherries and sweeten as for sauce; strain juice through a cloth, and for every quart of juice add half a pint of best Bourbon whisky; bottle and cork tight. This is excellent for family use. The cherries may be used for sauce, after the juice is extracted, as they are not pressed, but simply strained.

Bunches on Horses.—For all kinds of bunches on horses caused by bruises or injuries of any sort, a correspondent recommends the rubbing such with the tincture of arnica, diluting the same with water.

About Vinegar.—It was an observation made by Scheele, but the fact has recently been published as a new discovery, that ordinary brown vinegar will keep bright and clear for any length of time if heated to the boiling point for a few minutes.

Raw, mellow apples are digested in an hour and a half, while boiled cabbage requires five hours. The most healthful dessert that can be placed upon the table is a baked apple.

Religious Service in New Zealand.—A reverend gentleman gives the following description of a Hauhau service, which was simple, to say the least: The priest or leader put a bottle of rum before him. They then squatted on the ground, and the leader called on the names of Jehovah and of their king, repeating here and there a passage of Scripture, such as suited him. Sometimes there was offered praise to Jehovah and the king together. Then followed a chant and prayer. The whole lasted a quarter of an hour, when the rum bottle was opened.

The fearful increase of murders in New York has led, it is asserted, to the organization of a vigilance committee. A similar committee is also reported as existing in Chicago. In this city the number of criminal acts has been terribly large of late, but we hear of no committee, the authorities being believed to be capable of doing all that is possible.

The Grand Festival.—The choruses in the city are very busy rehearsing for Camilla Urso's festival. Next week and hereafter the grand chorus will practice three evenings weekly. It is to be hoped that associations elsewhere will work diligently that, when they meet in the city, all may be well prepared. The indications are that the affair will be a grand success.

A Word for Home Inventors.

Oakland, Cal., December 1, 1869.

Messrs. Dewey & Co.—Gentlemen: Permit us through your paper to return our earnest thanks for the prompt and successful manner in which you have conducted the various matters of business with the Patent Office committed to your care, more especially in securing for us our last valuable patent in the face of so many difficulties. Were it an ordinary case, in which you had simply secured us a patent, and for which services you had received a suitable equivalent, we should hardly consider you entitled to our thanks, however much we might feel gratified with your professional ability, uniform courtesy, or success. But this seems to be an exceptional case, and entitled to peculiar consideration. Without entering here into a detailed account of the legal complications and various discouraging circumstances you were obliged to contend with, suffice it to say, that your almost unhoped for success, securing, as you did, a full patent, despite all these obstacles, in so short a time, was scarcely less surprising than gratifying to us; and we feel it a pleasant duty to offer you this merited testimonial of our appreciation for the valuable services rendered, and to return you our sincere thanks for the same.

In closing, we would say to the public that this is entirely voluntary on our part, as Messrs. Dewey & Co. neither asked it at our hands, nor knew that we intended giving it. It is simply a free-will offering to professional skill and reliability, and a word of friendly counsel to others on this coast who may be possessed of valuable inventions on which they wish to secure patents. To all such our earnest advice is to place them at once in the hands of Dewey & Co., instead of being driven to it by a sad experience like our own.

Yours truly, Hubert Burgess,
James Stratton.

* * *

A Valuable Paper.—We place upon our list of exchanges the Scientific Press, a paper devoted to Mining, Farming and Mechanic Arts, published in San Francisco by Dewey & Co., every Saturday, at $4 per annum. It has just entered upon its twentieth volume.

Its mechanical execution is of the first quality, and its contents are of the first importance to every class of industry.

We commend the Scientific Press to the industrial public that want a good valuable paper.—*Pac. Observer.*

Treatment of Rebellious Silver Ores, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

Block Tin and Solder Wire, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 24v19-3m

---

Continental Life Insurance Co., 302 Montgomery street, corner of Pine.

Returned.—Dr. J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

---

Spectacles, their adaptation to the various conditions of sight, is C. Muller's specialty. His store is at 205 Montgomery street. *

Virginia, Nev., Jan. 27, 1870.

Messrs. Dewey & Co., *Patent Agents*—Dear Sirs:—I have your favor of the 24th inst., informing me that my application for patent of "Improved Roofing and Flooring" has been allowed, and I thank you for the attention and dispatch used in executing this business for me. Yours truly, Patrick N. Mackay.

New Mining Notices.

Alleghany Consolidated Gold Mining Company. Location of Works: Sierra County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the thirtieth day of December, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names	No. Certificate.	No. Shares.	Amount.
W H Tompkins	34	1000	$500 00
A L Whitney	32	185	92 50
John J Rorhe	4	15	7 50
Chas Adams, Trustee	12	1000	500 00
I N Thorne	13	125	62 50

And in accordance with law and an order of the Board of Trustees, made on the thirtieth day of December, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, Room 37 New Merchants' Exchange, on the twenty-eighth day of February, 1870, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, No. 37 New Merchants' Exchange, third floor, California street, San Francisco. feb5

Pilot Mining Company.—Location of Works: White Pine County, State of Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-third day of November, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Morris Newton, Trustee	not issued	1500	$150 00
F L Castle	not issued	100	10 00
John Hewston Jr.	not issued	1600	160 00
Lewis A Garnett	not issued	1600	160 00
H H Blake	not issued	840	84 00
A F White	not issued	840	84 00

---

A Valuable Book for Inventors and Artisans.—Dewey & Co., publishers of the Scientific Press and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the Scientific Press office, postpaid, for $1.—*New Age.*

To all who may wish to obtain a thorough knowledge of the industrial resources of the Pacific Coast, the Press will be found a valuable paper.—*Oakland Transcript.*

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, seven miles in length by four thousand feet in width, embracing five thousand and twenty acres.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of all mines discovered by the Tunnel.

4th—A royalty forever of two dollars on each and every ton of ore extracted from any part of the Comstock Lode, and

5th—The right of appropriation of all the water carried off through the Tunnel.

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, and be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to all parts of the mines, and through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make available many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt as to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, as has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwall, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata and Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots and mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very important revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Company two dollars per ton, forever, on every ton of ore extracted from any portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of his great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, and confidence in, all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coast,

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

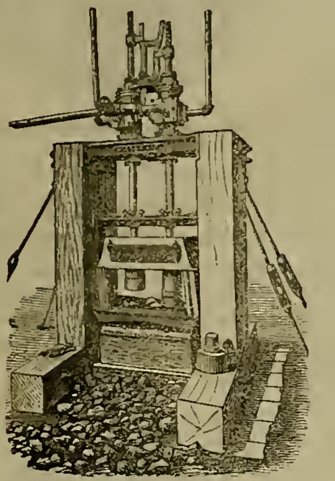
Machinery.

THE WILSON

Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

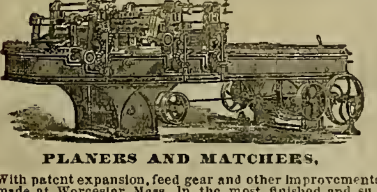
A. BICKNELL, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

Woodworth Planers,



PLANERS AND MATCHERS,

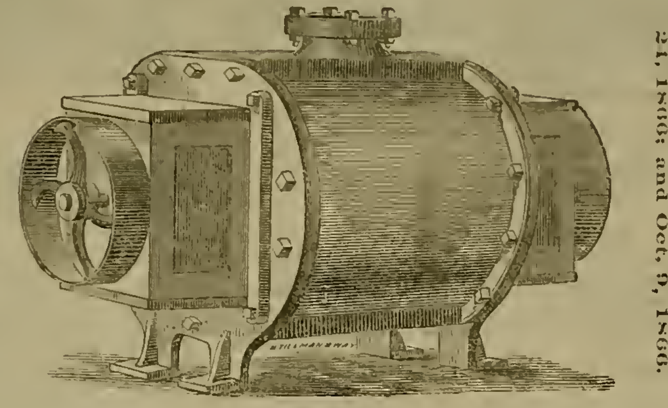
ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

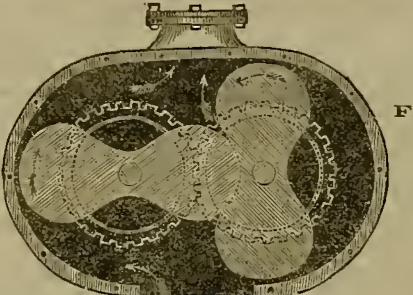
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 21, 1866; and Oct. 9, 1866.

ADAPTED FOR
Smelting,
Foundry,
Mining
and
Steamships.



REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlors for themselves, at the office, 229 Fremont street,

1v1 San Francisco.

Important to Californians.

The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods CHEAPLY, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

The plant has no enemies: mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $25 per hundred; 20 per cent. off to the trade. Address,

HENRY HUGHES & J. S. SILVER,
1v20-1m 302 Battery street, San Francisco.

Ayer's Cherry Pectoral,

For Diseases of the Throat and Lungs, such as Coughs, Colds, Whooping Cough, Bronchitis, Asthma, and Consumption.

Probably never before in the whole history of medicine, has anything won so widely and so deeply upon the confidence of mankind, as this excellent remedy for pulmonary complaints. Through a long series of years, and among most of the races of men it has risen higher and higher in their estimation, as it has become better known. Its uniform character and power to cure the various affections of the lungs and throat, have made it known as a reliable protector against them. While adapted to milder forms of disease and to young children, it is at the same time the most effectual remedy that can be given for incipient consumption, and the dangerous affections of the throat and lungs. As a provision against sudden attacks of *Croup*, it should be kept on hand in every family, and indeed as all are sometimes subject to colds and coughs, all should be provided with this antidote for them.

Although settled *Consumption* is thought incurable, still great numbers of cases where the disease seemed settled, have been completely cured, and the patient restored to sound health by the *Cherry Pectoral*. So complete is its mastery over the disorders of the Lungs and Throat, that the most obstinate of them yield to it. When nothing else could reach them, under the *Cherry Pectoral* they subside and disappear.

Singers and Public Speakers find great protection from it.

Asthma is always relieved and often wholly cured by it.

Bronchitis is generally cured by taking the *Cherry Pectoral* in small and frequent doses.

So generally are its virtues known that we need not publish the certificates of them here, or do more than assure the public that its qualities are fully maintained.

Ayer's Ague Cure,

For Fever and Ague, Intermittent Fever, Chill Fever, Remittent Fever, Dumb Ague, Periodical or Bilious Fever, &c., and indeed all the affections which arise from malarious, marsh, or miasmatic poisons.

As its name implies, it does *Cure*, and does not fail. Containing neither Arsenic, Quinine, Bismuth, Zinc, nor any other mineral or poisonous substance whatever, it in nowise injures any patient. The number and importance of its cures in the ague districts, are literally beyond account, and we believe without a parallel in the history of Ague medicine. Our pride is gratified by the acknowledgments we receive of the radical cures effected in obstinate cases, and where other remedies had wholly failed.

Unacclimated persons, either resident in, or travelling through miasmatic localities, will be protected by taking the *AGUE CURE* daily.

For *Liver Complaints*, arising from torpidity of the Liver, it is an excellent remedy, stimulating the Liver into healthy activity.

For Bilious Disorders and Liver Complaints, it is an excellent remedy, producing many truly remarkable cures, where other medicines had failed.

Prepared by DR. J. C. AYER & Co., Practical and Analytical Chemists, Lowell, Mass., and sold all round the world.

PRICE, $1.00 PER BOTTLE.

Sold by all druggists and dealers in medicine everywhere. Crane & Brigham, San Francisco; R. H. McDonald & Co., Sacramento, General Agents. 15v19eow-4m

New Incorporations.

The following have filed articles of incorporation with the County Clerk, S. F.:

California Street Sweeping Co.—Jan. 27th. Capital, $30,000. Trustees: D. C. Woods, E. A. Rowe, J. McCombe, H. Still and C. J. Pillsbury.

G. A. R. Cemetery Association.—Jan. 28th. Trustees: C. E. Lancaster, F. A. Montell, A. H. W. Creigh, C. W. Nystrom, C. P. Kelly, J. C. Sargent, W. H. Aiken and James O'Brien.

The following have been recorded in the Secretary of State's office, Sacramento:

Colusa Railroad.—To run from Colusa *via* Marysville to Nevada. Capital, $2,000,000, in $100 shares. Business office at Marysville.

Stockton and Ione R. R. Co.—Feb. 2d. Object to construct a road from a point ten miles east of Stockton, and using Copperopolis Railroad, to end near Ione City, Amador. Capital, $1,500,000. Directors: John Wilson, Geo. Gray, A. Clark, H. E. Hall, E. R. Stockwell, J. H. O'Brien, J. K. Doak, R. K. Reid and E. S. Holden.

Mission San Jose Water Co.—Feb. 2d. Capital, $3,000. Trustees: E. L. Beard, H. S. Ellsworth and J. L. Beard. Place of business, Mission San José.

◆

The Darien Canal.—A dispatch of the 31st of January announces the organization of a new company for constructing the Darien canal. Four French bankers and a dozen American capitalists are at the head of the company. The importance of the work is very great. The distance of sailing between San Francisco and New York will be reduced about one-third. The company await the report of the United States Exploring Expedition before commencing work.

Volunteer Compliments.

From an endless series of appreciative testimonials and frank acknowledgements, we give the following:

"Tidal Wave" Office, Silver City,
Idaho Territory, July 27th, 1869.

Messrs. Dewey & Co.—Gentlemen:—Allow me to express my high appreciation of the ability and business management of the Mining and Scientific Press Patent Agency, and to say that our business relations have been marked with the utmost promptitude upon your part and with entire satisfaction upon mine.
Yours, etc., Jno. S. Butler.

San Francisco, May 5, 1869.—Messrs. Dewey & Co. Gentlemen:—Allow me to express to you many thanks for services rendered me in procuring my patent, which has just come to hand. I would also say that your work has been faithfully done, and your advice and representations have in all cases been honest and truthful.
Respectfully, Geo. Inwood.

San Francisco, April 19, 1869.

Messrs. Dewey & Co., Patent Agents.—*Gentlemen:*—Allow me herewith to tender you my sincere thanks for the efficient assistance you have rendered me in securing my patent, and other papers, as well as the promptness and energy displayed by you in our business transactions. Very respectfully yours, C. E. Jaycox.

Grass Valley, Dec. 2, 1868—*Messrs. Dewey & Co.*—Having received the patent for Symons & Co's Tossing and Refining Concentrator, through your Agency, we return our sincere thanks to you for your unrivalled success. Yours, respectfully, Symons & Harry.

Mayfield, Cal., June 26, 1869.

Dewey & Co., *Patent Solicitors, San Francisco*—Gentlemen:—In acknowledging the receipt of my Letters Patent, allow me to express my thanks for the skillful and trustworthy manner in which you have conducted my business before the Department at Washington. I am perfectly satisfied with the high degree of ability and integrity displayed in the management of my case, and I know of no similar agency in which I could place corresponding trust. Yours truly, J. M. Johnson.

Stockton, April 8th, 1869.

Messrs. Dewey & Co.:—Your favor of the 6th inst., accompanying patent for improvement in horse shoes, is received. I beg you will accept the earnest assurance of my gratitude for your kind assistance and valuable services. Very truly yours, W. R. Watson.

Somersville, Cal., August 25th, 1869.

Messrs. Dewey & Co.—Dear Sirs: Allow me to return you my thanks for the very able manner in which you have conducted the business entrusted to your care. You will please forward the document (British Patent) by Bamber's Express to this place. Yours, respectfully,
Geo. Hawxhurst.

Jamestown, Cal., July 6th, 1869.

Messrs. Dewey & Co.—Gentlemen:—The Patent for our Ore Washer and Concentrator was duly received by express. We return you our thanks for the promptness and successful manner which have attended your efforts in our behalf. Yours, Wm. G. Heslep.

Santa Cruz, December 30, 1869.

Messrs. Dewey & Co.—*Gentlemen:*—Yours of the 24th December, inclosing my patent for construction of earthquake-proof wall, was duly received last night. I am highly pleased with the way in which the business has been done. The ability which carried it through, and the scrupulous care bestowed on its preparation, are above praise; and I will gladly intrust to your hands any further business I may have to do, which will soon take place on a very useful and important invention.
Very truly yours, A. McPherson.

Nevada City, Nov. 3d, 1868.

Messrs. Dewey & Co.—Gentlemen:—Your favor of the 30th ult., is just received, informing me of the successfull prosecution of my application for a patent on my "Hair Cutting Shears." Please accept my sincere thanks for the speedy and successful manner in which you have conducted the case, and believe me, as ever,
Very truly yours, Lee D. Craig.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

Illustrate your Inventions

In the Scientific Press,

An illustrated journal of Mining, Farming, Mechanic Arts and Industries on the Pacific Coast. It costs no more for a superior engraving by our experienced artists than is usually charged for a less perfect picture. If you wish to introduce a new invention properly before the public, the first steps in so doing are important ones. A full description and correct representation in the Press will go further and prove more quickly effective than any other means.

The fact that an illustration is admitted into our columns, guarantees the invention important consideration in the minds of thousands of the most intelligent readers—at home and abroad—who would not notice it so favorably or so thoroughly, if at all, when presented through an unreliable medium or indifferent source.

The model of an invention sent to us is sufficient for making a good engraving, Sometimes a photographic view is sufficient; but it is always best accompanied with drawings or a copy of the patent, A first-class illustration has proved to be one of the best and cheapest means of obtaining purchasers for a good machine or a valuable patent.

Cuts ordered for illustration are the property of the inventor who pays for them, and can generally be used for circulars, pamphlets, books, or other newspapers. The engravings to be seen in each issue of the Scientific Press are a fair sample of the work of the artists who can always be found in our office.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint. San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S. Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adns, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differs special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven. Conn. 13v6-1y16n

Grapes on the High Sierras.

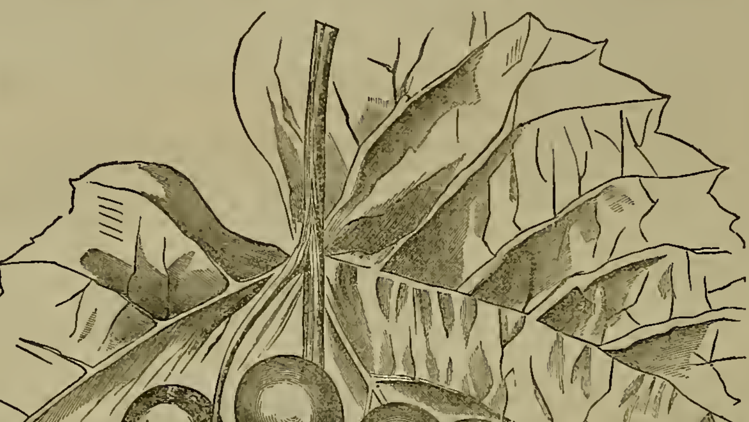
There is a large area of elevated, good agricultural land, on the Pacific slope, from four to six thousand feet above the level of the sea, occupied by a hardy and industrious class of people who have settled upon it as agriculturists. The chief portion of this land consists of a chain of beautiful mountain valleys, commencing with Sierra Valley—the one first north of the lakes which form the source of the Truckee river—and embracing, in succession, the American, Indian, Honey Lake, Mountain Velley, etc.; the chain running far north into Oregon. These valleys constitute gems of green meadows nestled within the snow-clad peaks of the Sierras, everywhere fringed with noble evergreens and covered with rich natural grasses.

Within these valleys are located some of the finest dairies and stock ranches in the State, and the golden grain here and there waves in the cultivated fields. Nearly all sorts of vegetables are also grown there, upon ground covered by snow in winter and where the frost retards the early approach of spring. Many of the hardier sorts of fruits have also been found to do well there; and some, once thought quite too sensitive to cold and frost, have rewarded the venturesome hand.

Quite too little attention has been paid to the agricultural resources and possibilities of our high agricultural lands. A few experiments which have been made, have shown that even in the sterile State of Nevada, where blighting winds hold dominion over sage-brush, hill and plain, where snow and frost bind up the earth for more than half the year many places prove fertile to the farmer's art, and produce grain, vegetables, and some fruits, and are even made to "blossom as the rose." But, as far as we have observed, none of these mountain places have been tried with the luscious grape, that makes the lower hills and valleys purple in the sun. From experience in other culture there can be no doubt but the hardier sort of grapes, such as are grown in the Northern States, would thrive equally well or better in all the places mentioned, and would surely reward the enterprise that might introduce them.

We might mention many varieties that are held in high esteem, which would be likely to flourish in such localities—the Diana, the Catawba, the Concord, the Delaware, the Isabella and Muscadine among others—all of which should be tried by our mountain friends. Many a miner, even, in his high mountain home, might plant a vine to bless and refresh either himself or some future wanderer on his track.

We have herewith figured the first of the varieties named, an excellent grape and one very extensively cultivated in the Northern States. The bunches are of medium size, but very compact. The berries are rather larger in size, round, and of a pale red color. The skin is thick, which renders it well suited for transportation, while for keeping it has no superior. Its flesh is tender pulpy, very sweet and juicy. It colors its fruit as early as the Concord; but does not mature much earlier than the Catawba. The thickness of its skin allows of its being left on the vine until pretty severe frosts come. In fact, light frosts seem to improve its flavor. A dry and gravelly soil suits it best; for on deep rich soil it is inclined to make too much wood.



A MOUNTAIN GRAPE—"THE DIANA."

We figure the Diana as a fair representative of the variety of grape suited to cold latitudes.

Origin.—This grape was a seedling grown from seed of the Catawba by Mrs. Diana Crehore, of Milton, near Boston, Massachusetts. Hence its name.

We hope our mountain readers—those who dwell in the higher portions of the Sierras, and residents of the elevated table regions of the State of Nevada—will deem these remarks of sufficient importance to act upon the suggestions, and move at once for the introduction into the localities referred to of the more hardy varieties of the grape.

As some little evidence, of the practicability of what we suggest, we would state that at Crystal Peak, on the Truckee, there is growing a grape vine of the Mission variety, which was planted several years ago by a clergyman named Heckle. This vine has produced grapes for three successive years. Mr. Tolles, near Reno, Nevada, has also produced fine Catawba grapes. The only reason that grapes are not growing all over the mountain regions and the table lands beyond, is the simple one that they *have never been planted*. That the more hardy varieties will succeed in such localities is a positive certainty.

In planting grapes in elevated regions, or where early frosts may be expected, it is always advisable, when it can be done, to set them out by the side of large rocks, and train them over or near them, instead of upon stakes, as is practiced in the valleys. The reason for this is self-evident. The rocks absorb a large amount of heat by day, which they are constantly giving out by night. So much is thus given off from a large rock or boulder that a vine in immediate contact or near proximity thereto will be entirely untouched by the frost, when much hardier plants, in the open field a little distance, will be killed.

A New Pile-Driver.

The Pacific Railroad Company are building, at Oakland Point, one of Bolen & Craine's machines for driving piles by the direct action of steam. As this is the first machine of the kind ever built on this coast, its completion and operation is looked for with some interest.

The frame differs from the ordinary pile-drivers in appearance, by having one upright, which looks very much like the mast of a vessel. This mast is the guide to the steam hammer, which, with its cylinder and casing, weighs about three tons, and may be individualized as separate from the other works. It stands upon the pile to be driven, and strikes eighty blows per minute. The hammer is attached to the piston, and is raised by the direct action of the steam in the cylinder above it. The full stroke is forty-two inches, but may be regulated to any degree less by the engineer. The top of the pile is champered to receive a beveled ring one foot square. The casing in which the hammer works sockets onto the beveled ring, thus securing a firm rest, and by its own weight assisting in the work. Another engine, on the scow, handles the piles, and raises the hammer-engine to the elevation at which it is to be placed upon the top of the pile to commence its work.

On general principles we are inclined to think the weight of the blow should *always exceed* the amount of resistance to be overcome; otherwise the pile will suffer the effect of the shock. Our experience in driving nails, pegs and posts leads us to the opinion that a few heavy blows are more efficient than many light ones, and with less damage to the thing driven. If this machine combines sufficient force with rapid blows, it will be a sure success.

DESTRUCTIVE FIRE AT THE GOLDEN STATE IRON WORKS.—Early last Saturday morning these works and the St. Charles Hotel, adjoining them, were discovered to be on fire, and before the engines were able to get at work the upper part of the foundry building was wholly destroyed and the lower part badly damaged. A large quantity of patterns was destroyed, and much of the machinery very badly damaged. Mr. Palmer estimates the loss at about $40,000, the heaviest loss being in patterns. The establishment was owned by Palmer, Knox & Co., and was insured for $9,500. The cause is as yet unknown. We hope that the proprietors may be able to repair the damage, and that the works may soon be again in operation. They are men who have the full confidence and esteem of the community.

Communications.

Clothing Appropriate for the Pacific Coast.

[Written for the Scientific Press.]

Editors Press:—I have been induced, from the appearance in the Scientific Press of an article respecting the importation, by Messrs. Butterfield & Co., of a considerable number of Cashmere goats, and other articles in the *Morning Call* relative to the silk manufacture, to append a few observations, closely allied to the economic use of wool, as associated with other agricultural industries. The daily climatic variations observed on the coast of California are well known to us, while in the interior these changes are more equally divided into seasonal, in place of daily occurrence. Excepting at very great elevations, the latter variations are by no means so severe as on the Atlantic coast, within the same latitudes.

So far as the coast line is concerned, I am prepared, by personal experience, to testify that no textile is so efficient for possessing the opposite qualities of mitigating, to the wearer, the effects of cold, and also that of extreme heat, as exterior clothing composed of cloth formed by the combination of silk and the fur of animals, such as that of the beaver, hare, rabbit, and next wool and animal fur, and lastly, linen or cotton used jointly with the same product. About twenty years ago, textiles of the character named were manufactured in England, under the name of "Astoria cloth," and were used to some extent, generally, for ladies' cloaks, but never become thoroughly fashionable, chiefly, I believe, because the fur was not susceptible of taking such brilliant tints as silk, wool, etc. As combining warmth with extreme lightness, the textile named stands unrivalled. Next to this variety of cloth, for the qualities named, is the mixture of wool with silk; then flax with wool, and lastly, cotton with wool (winceys). the last, however, rather trashy, for either men's or woman's wear; but flax and wool (the true old linsey-woolseys) are admirable for both.

From the preceding sketch it will be easily understood that, possessing as we do on this coast, not only practically unlimited resources for the production of the raw materials, fur (much now thrown away), silk, flax and wool, as well as a climate which is peculiarly suitable for the consumption of mixed fabrics, composed of those materials, accompanied also by the advantages of possessing, if economically husbanded, of a more than sufficient amount of water-power for their manufacture into commercial materials, form combined advantages rarely met with. If health and comfort by our people are studied, fabrics, such as are now recommended, would at once become the general wear on this coast, for both male and female, whenever the articles are brought into market, especially if of home production.

Provided some of the raw materials, such as silk, could not be obtained as the product of the State in adequate quantities in the first instance, any quantity can be imported from Japan and China; the trade in which from those countries to New York now passes through San Francisco; while by manufacturing it here, not only would two freights be saved, so far as our local consumption is concerned, but at the same time would distribute in wages a large amount of money amongst industriously-disposed females.

It is sincerely to be hoped, therefore, that both Mr. Newman's enterprise, as well as another of a similar kind which is now under consideration by some gentlemen who have had practical experience in some important branches of the silk manufacture at the East, will meet with adequate encouragement by our citizens.

Thomas Rowlandson.

San Francisco, Feb. 7th, 1870.

◆

An Opinion.—The *Scientific American* says that many practical and scientific men believe we are on the eve of new discoveries which will render the navigation of the air practicable, notwithstanding the failures which have hitherto attended experiments in this field. Whether the problem is solved or not, it will never lose its fascinations.

Heating Saline Solutions by Steam.

[Written for the Scientific Press.]

Editors Press:—The fact noticed by you in your issue of January 15th, that the temperature of a saline solution can be raised above 212° by steam of that temperature, must have long been practically familiar to many. In fact, I have been accustomed to regard it as self-evident, though, on further consideration, I find it less so than I had supposed.

As you do not offer any explanation of the phenomenon, I beg to suggest one, which, however, may not be correct.

I suppose it to be due to the solubility of steam in water of the same temperature as itself, by which it becomes amenable to the effect of saline matter, also in solution, in raising the point of vaporization, in consequence of which the steam is reduced to water, and imparts its latent heat of vaporization to the saline fluid, till the latter is raised to its boiling point.

If this view is correct, it would be easy to determine the quantity of steam at 212° which would be required to heat a given weight of a saline solution of known density to its boiling point, the specific heat of the solution being previously determined, with, of course, due allowance for the progressive depreciation of its density by condensation of steam.

It will also follow that a liquid in which steam is not soluble, such as mercury, could not be heated above 212° by steam of that temperature.

Perhaps some of your correspondents can give a better explanation; but the practical point to which I would call attention is, the advantage which, with several others, is thus gained by injecting steam directly into the pulp, in amalgamation, instead of heating it by means of a steam chamber, with open discharge pipe, beneath the pan—that is, when a high degree of heat is desired, the pulp being, as is usual, a saline solution, the boiling point of which is above that of simple water. The object could certainly be attained by means of a *closed* steam chamber, in which considerable pressure could be maintained; but the direct injection offers considerable advantage in point of economy, though some object to it on account of thinning the pulp—a point, however, to which I think too much importance has been attached.

C. H. A.

Benton, Mono Co., Jan. 20, 1870.

Making Ice.

[Written for the Scientific Press]

Editors Press:—In your last issue I noticed an alleged new method (inappropriately termed "vacuum method") for making ice by the expansion of compressed air in contact with water. This is one of those inventions which every few years make the rounds of the newspapers as technological novelties. Some fifteen or twenty years ago I remember having found in an old English print the same invention credited to Sir Isaac Newton, and since then it has several times been brought forward as something new. Sir Isaac's mode of operation was stated to have been somewhat as follows: He had an old cylindrical vessel of iron, like a steam boiler, buried 20 feet under ground. From this vessel two pipes extended to the surface. To one of them was attached a compression pump; and the other, which could be closed by a cock, opened into a vessel containing water. By means of the pump, air was forced into the vessel until the pressure amounted to several atmospheres. After sufficient time had elapsed to allow the heat caused by the compression to be conducted off, the cock inserted in the other pipe was opened, permitting the air to stream into the water. The air by its expansion was compelled to bind latent heat which it had to take from the water, and the latter was of consequence converted into ice.

A. F. W. P.

◆

Dissolving Notes.—A man can give his neighbor a promissory note moistened by a fluid lately invented by a French chemist, and in a month afterwards the holder will have nothing to show for it but a little dust. If this fact becomes generally known short credits will become the rule, in order that the debtor may be compelled to come down with the dust before his note does.

Early Fire Extinguishers.

We take the following from an article in the *Scientific American*: "Syringes were in use in London till far into the seventeenth century. They were of brass, and the largest of them held no more than a gallon. Three men were required to work one of them—two to hold the instrument and one to work the piston. Supposing one of the syringes could be filled and discharged four times in a minute, four gallons only could be applied in that time by one instrument. A steam fire engine can throw twelve hundred gallons per minute a distance of two hundred and ten feet. Even supposing—a supposition manifestly absurd—that the syringe could throw water the same distance, it would require nine hundred men to do the work now done by one or two. All things being considered, fifty thousand syringes would not be as serviceable as one steam fire engine.

In the sixteenth century syringes were made which differed from those previously in use only in being larger and being placed on wheels. A picture of one of these is preserved in Besson's "Theater," and looks, for all the world, like an immense sausage stuffer, capable of holding about a barrel of water. It had no hose (the ox's gut contrivance had been lost during the middle ages), and consequently the direction of the stream of water could not be easily changed, had the contrivance been placed simply on wheels. To avoid this difficulty, the syringe swung on pivots, and thus could be elevated and depressed, but when motion from side to side was required, the whole machine had to be turned."

The destruction of timber in the United States is and has been one of the most prominent of our national vandalisms. Forests have been swept away with as little consideration as a farmer bestows upon the thistle he wishes destroyed. This destruction has to a great extent been inexcusable because unnecessary. To clear land enough for farming is necessary, as also the cutting of ship timber and lumber for the purposes of society. But the waste and wanton destruction of fine timber for mere temporary convenience or amusement, or carelessness, or through a mere spirit of recklessness, ought to meet with public and private condemnation. One of the exhibitions of this spirit is seen in the too common destruction of timber on the public lands. Not alone on lands the title of which still remains in the Federal Government, but lands that have been donated to the State for special purposes. The sixteenth and thirty-sixth sections belong to the schools of the country. On these, trespassers have been busy in many cases where the lands were well wooded. In many cases the timber constitutes their chief value. This timber is being continually stolen and wasted. A stop should be put to this, and therefore we are glad that Mr. Hager has introduced a bill providing for the protection of this timber, and for the punishment of trespassers. The bill should become a law.—*S. F. Call.*

Oxygen for Public use.—Oxygen gas is now produced on a large scale commercially in Paris. Carts with metal reservoirs containing gas may be seen in the streets for the supply of consumers. The Gaieté Theatre is one of the largest consumers, the outside being illuminated every night by the oxy-hydrogen light, cylinders of magnesia or zirconia taking the place of those of lime, as ordinarily used for this purpose. The light is interspersed among the gas jets with good effect. In the interior, the scenes owe many of their beautiful effects to the use of this light. The oxy-hydrogen light is also used largely for the production of the illuminated advertisements now so common in the Boulevards and other places. These are produced by a magic lantern and screen on the second floors, and the parties undertaking the display of these advertisements are large consumers of the oxygen gas.

Tea in Tennessee.—James Campbell, who resides on the banks of the French Broad river, near Knoxville, Tenn., has tea plants, received from the Patent Office, ten years ago, and now standing from five to six feet high. The tea which they produce is said to be excellent. The soil on which these plants are growing is a rich, ferruginous soil; probably very similar to that in the foot-hill valleys of this State. Mr. Campbell has no doubt of the possibility of the successful cultivation of tea in this country.

Siamese Paper.

A German publication gives the following account of how paper is made in Siam: "The material employed is the root of a tree called the *ton koy*, four or five feet in length, and sold in bundles of 10,000 pieces for twenty-five cents. The roots are first soaked in fresh water and then transferred to tanks with lime water, where they are left for several days. They are then boiled in peculiarly constructed pans, the lower part of which, exposed to the fire, is made of sheet iron, while the upper part is of basket work. After being well steamed in these vessels, it is taken out in small quantities and thoroughly hammered on a table. After this process a bundle of the fiber is thoroughly agitated in water until small feathery clumps swim about in the tub. The contents of the tub are poured through a sieve and the fiber caught on the meshes in tolerably uniform thickness. This uniformity is further aided by rolling bamboo over it, and the sieve is then exposed to the sun until the mass is thoroughly dry. The sheets of paper prepared in this way depend in size upon the sieves. They are sometimes ½ yard wide and 2½ yards long. Two workmen can make twenty sheets in a day. No sizing is used, as the gelatine of the root is sufficient for that purpose. A better sort of paper is sold in sheets 10 to 12 inches long, and four to five inches wide. Writing is done with charcoal or with pencils prepared of coal and lime."

Alaskan Sledge Dogs.—The *American Naturalist* has an article by H. M. Bannister upon "the Esquimeux Dog," from which we copy the following: "The Alasken Esquimaux sled is a rather heavy looking affair, nine or ten feet in length by two in breadth, with thick, strong runners, often shod with pieces of solid whalebone. To the front is attached a strong rawhide rope, eleven or twelve feet in length, to which the dogs are fastened by a harness, consisting of a breast band and another strip passing over the back, and underneath the dog immediately behind his fore legs. The continuation, of the breast band, passing backward on each side, join over the back, and from this junction is continued a short trace, by which the dog is fastened to the rope, in equal numbers on each side, and one at the end. By this arrangement a great deal of the strength of the dog is wasted in side draft; notwithstanding this, it is probably the best that can be made, since it allows of no such snarling of the lines as would inevitably result were any more complicated arrangement adopted. A team of dogs will frequently stop when under full headway to engage in a general fight; and on being brought to order by an energetic use of the whip, both lash and stock, will jump to their places and proceed as before, without any confusion or entanglement whatever."

Improvement in Railway Sleepers.—The *American Railway Times* thus describes a late invention: "Mr. F. H. Whitman, of Portland, Maine, cuts across the upper face of the sleeper, just under the rails, two recesses, twelve inches long, and two deep, and into this puts a section of oak plank, nicely fitted, upon which the rails are laid. The recesses are cut by a portable machine, worked by power, and the oak is put in with the grain of the wood running in the same direction as that of the sleeper. As wood does not perceptibly contract or shrink in the direction of the grain, a permanent fit is made. This oak cap gives a very durable bearing for the rail, and as the spike holes are bored in it, there is little danger of its checking. Any of the softer sap woods that are used for cross-ties are strong enough to hold the rails in gauge. The machine for cutting the recesses cuts at both ends of the sleeper at once, and can be adjusted to any gauge.

The Rumford Medals.—In July, 1796, Count Rumford requested the American Academy of Arts and Sciences to accept five thousand dollars in United States stock, the interest to be applied to premiums, to be given to the authors of the most important discoveries or useful improvements which shall be made in America, on heat or light. To be given in two medals, one of gold and one of silver, together of the value of three hundred dollars. At a meeting of the Academy in Boston on January 11th, these medals were presented to George H. Corliss, of Providence, R. I., for his improvements in the steam engine.—*Artisan.*

Mechanical Progress.

The Year's Advance in Mechanical Economies.

From an article in *Engineering* noting the progress for 1869, we give here a few condensed paragraphs: The tendency is still to make heavier and more powerful machines. The fact is becoming generally recognized that they are a source of undoubted economy. A tool that will clear off in a single cut a quantity of metal that could only be removed by two or three successive cuts in a lighter machine, not only effects an important saving in time and attendance, but it enables a larger amount of work to be got through in a given area of shop room, and renders, to a great extent unnecessary precise and consequently expensive forgings. There are a vast number of cases in which it is cheaper to bring a rough forging to shape in a lathe or planing machine than it is to forge it more nearly to form under the hammer.

With the increased employment of heavy tools, the plan of driving each machine by a separate engine is gradually becoming more extensively adopted, and this is particularly the case with punching and shearing machines.

Another feature which has received considerable development during the past year, is the construction of machines adapted to special classes of work. This is as it should be, and we expect during the next few years to find that these special tools will, to a great extent, supplant machine tools of the ordinary standard forms. Another matter in which some progress has been made, is the adoption for many classes of work, of the copying principle. Of course the principle can only be economically adopted where large numbers of articles have to be turned out to one pattern, but even with this restriction there are vast fields for its employment. With the more extensive adoption of the copying principle must come the increased employment of the milling tools or revolving cutters so extensively used in America, and yet so comparatively little used here; while the increased employment of milling tools again will lead to the manufacture of new machines for making them."

ANVILS.—A Sheffield inventor has patented an improved method of making anvils, which, it is believed, will secure a uniform hardness in the steel face,—a desideratum often incompletely answered by the old plan of welding it to the butt. The *Mechanics' Magazine* thus describes the process of manufacture: "He first prepares a model of the size and shape of the anvil to be produced, places it in a box, covers it with composition, and fills up the box with sand in the ordinary manner. After the model is removed and the sand perfectly dry (this being done the usual way), he first pours in the molten steel to form the face or table, then through the same aperture (after the steel on the table is sufficiently cool), he pours in a very mild molten steel, which flows over the table and gives the requisite toughness and solidity to the steel beck. After a proper time has elapsed, he pours through another opening the iron or metal, which also runs upon the steel and forms the lower part or butt of the anvil, and a perfect amalgamation takes place between the iron and steel."

NEW MODE OF SETTING BOILERS.—The Sheffield (Eng.) *Independent* describes a re-recently patented plan as follows: "By a simple arrangement of fire-clay plates, so managed as not to contract the capacity of the flue at any single point, the gases, after being thoroughly intermixed, are at four successive stages in their progress through the flue, thrown, in thin streams, against the surface of the boiler. No part of the gases can escape this repeated forcible contact with the boiler, and in the process the heat they contain is so thoroughly extracted and absorbed that the result obtained, as proved by careful tests, is the evaporation of nearly twelve pounds of water for every single pound of fuel, common boiler slack being used. This gives a large saving of fuel as compared with the best modes of setting previously in use."

A NEW SAFETY VALVE.—A recent English invention for this purpose is so contrived, that the steam that passes the valve, either from low water or over-pressure, is conveyed to the furnace and blown directly upon the fire; thus reducing both the steam pressure, and the steam generation at the same time.

Slate Pencils.

In 1850, a Yankee boy discovered a quarry of stone near Castleton Vt., which was especially suited for slate pencils. After manufacturing for a while with his jackknife, he bought the land and quarry for one hundred dollars. The same, with the machinery since erected, is now owned by a joint stock company, and valued at three hundred thousand dollars. The process of manufacture is thus described by the *Scientific American*: "After the stone is quarried it is sawn into rectangular blocks five inches by seven, and split by hand into slabs. These pass through a machine which shaves them all to the uniform thickness of a quarter of an inch. Iron plates, fastened to an endless chain which passes over rollers at either end, each receive a slab, and as it passes from one roller to the other the pencils are cut and rounded half way to completion by semi-circular knives. The slabs are then turned over and passed back through another machine exactly similar, and a perfect pencil is the product. They are counted out by children and packed one hundred in a box. The pencils are sold at fifty cents a box, or ten times the cost of slate pencils in Germany. Being made from a superior article of stone, they are used throughout the United States in preference to those imported.

The stone from which the pencils are made contains upwards of thirty per cent. of alumina. The company are putting up buildings and will soon be manufacturing alum on a large scale.

ELASTIC STEEL WHEELS.—Col. Clark, Supt. of the carriage department of the Royal Arsenal, has invented an elastic wheel, which is illustrated in the *Engineer*, and is thus described: "It consists mainly in the employment of tempered steel spokes, made of the description and dimensions of steel used in the manufacture of cart and wagon springs, and tempered in the same way. They are fitted in pairs, each pair strutting apart as far as the nave will admit at the center, and meeting at the Tee rim or felloe, to the web of which they are secured by the same bolt. It is evident the load, which is supported at the nave, will have a tendency to bow out the lower spokes, while the upper ones will be extended in tension; a sufficient number of spokes are employed, and likewise a sufficiently strong rim, to prevent objectionable or weakening distortion, and yet there is a sensible yield, which insures easy draught, great endurance, and an immunity from excessive weight. A pair of 5-foot wheels on this principle, are now under trial by the Royal Artillery."

COATING STEEL INSTRUMENTS WITH QUICKSILVER.—This,—says the *Iron Age*,—may be easily accomplished by cleaning the iron first with hydrochloric acid, and then immersing it in a diluted solution of blue vitriol mixed with a little hydrochloric acid, by means of which it becomes covered with a slightly adherent layer of copper, from which it must be freed by brushing, or rubbing with sand-paper and washing. It is then to be brought into a diluted solution of mercurial sublimate, mixed with a few drops of hydrochloric acid. The article will now be covered with a layer of mercury, which cannot be removed even by hard rubbing. This layer of quicksilver protects the iron from rust, especially if it be washed with spirits of sal-ammoniac after the amalgamation. Articles for the laboratory, and for other purposes, coated with quicksilver in this way, and allowed to be exposed with similar articles not so protected, retain their luster perfectly, while the others become covered with rust.

TELEGRAPHIC LIGHTNING DISCHARGER.—M. Bertsch, a Paris electrician, has contrived an apparatus by means of which a current of atmospheric electricity, arriving by the line wire at the telegraph instrument, passes away into the earth without doing any damage, while a current of voltaic electricity, arriving by the same route, is not permitted in any degree to escape. Thus one of the drawbacks to the successful working of the wires in a thunder storm is removed, and the danger to the operator nullified.

WIENER KALK.—This substance, Vienna chalk, is generally used instead of crocus, by European watchmakers, for polishing metals. It is used with oil.

Scientific Progress.

Principles of Molecular and Cosmical Physics.

Prof. W. A. Norton contributes an article under this title to *Silliman's Journal* for January. His theory is, that the principle of universal gravitation, as well as the doctrine of the molecular forces which he has in a previous paper set forth, may be directly reduced from "*a single force of repulsion exerted by every primary atom upon every other atom.*" We have not space for the very interesting course of reasoning which he adopts. We can now only quote briefly from a single paragraph:

"The Molecular Forces, so called, consist of a force called the attraction of cohesion, and one or more forces of mutual repulsion. The force of heat is recognized as one force of repulsion, and has generally been regarded as the only repulsion in operation. But this notion must certainly be disregarded by all physicists who maintain that the heat-repulsion is due to the vibrations of the atoms of bodies; since such vibrations can only be maintained by the operation of existing antagonistic forces of attraction (or virtual attraction) and repulsion. * * We must then conclude that there is a primary force of molecular repulsion, in addition to that of heat. We might perhaps ascribe this force to the repulsion of the ethereal molecular atmospheres when brought into contact; but to what can we ascribe the heat-repulsion? It has come to be generally believed that it must consist in some mode of motion of the atoms, or molecules of bodies, as a whole; either of vibration, revolution, or rotation. But it might be almost demonstrated, did space permit, that this cannot be the true nature or origin of heat. I will only allude here to one or two arguments in support of this statement, which may be briefly given. It is well known that when any body is by collision with another body, or in any other way, permanently compressed, heat is given out. Now the fact that a force of pressure, or percussion, produces a permanent compression, increasing with its intensity, leads to the almost inevitable inference that in the act of compression the atoms, or molecules, experience some change of physical condition, by reason of which the molecular attraction is augmented, and the condensation maintained, and that this change must be proportionate to the degree of condensation, and so to the amount of heat evolved. Can such a change proportionate to the heat evolved, be connected by any admissible supposition with the augmented velocities of vibration, revolution, or rotation of ordinary atoms, in which the increase of heat is conceived to consist? In fact the entire phenomena of inelastic, as well as of elastic reaction, point to the conclusion that they are attended with changes in the physical condition of the atoms, ordinarily so called, and that the evolution or absorption of heat that takes place is the direct result of these changes.

Again it is not conceivable that the phenomena of electricity can be ascribed to any imagined motion of ordinary atoms, or molecules, whether these are surrounded with ethereal atmospheres or not. We are accordingly constrained to look in some other direction for the origin of the molecular forces and agencies; and it appears to me that it is to be found in the general conception of an electric ether less subtile than the luminiferous, and gravitating like this toward the atoms of ordinary matter, so as to form envelopes to these atoms, permeated and underlaid by the condensed luminiferous ether. Each atom would thus be surrounded by an ethereo-electric atmosphere. The atoms of electric ether may be conceived to be masses of condensed luminiferous ether, but far more minute than those of ordinary matter."

COLORING MATTERS OF FLOWERS.—M. Morat, who has been investigating the subject, finds these to consist—1st, of a blue substance, which he calls cyanine; 2d, a rose-colored or pink material, really identical with the first, and only altered by the acidity of the juice; and 3d, two yellow-colored matters, one in solution in water, called xanthine, and the other insoluble called xanatheine. Reducing agents will decolorize cyanine, and oxygen restores the color. A red coloring matter, found only in young wines, is called œnoline by Morat, but is generally believed to be identical in composition with cyanine.

First Formation of Common Salt.

Prof. C. A. Goessmann, of the Massachusetts Agricultural College, read a paper before the National Academy of Science at the Northampton meeting, upon the "Chemistry of Common Salt." We find it in the *American Journal of Science and Arts*, and quote the following:

"Accepting the theory that our earth has gradually passed from a gaseous to a solid condition, we may assume that the formation of chlorid of sodium took place mainly during the last stages of its consolidation, at a period when the more volatile elements reacted upon each other, in consequence of the diminution of temperature; that subsequently water caused the oxydation of numerous chlorids and sulphids, the acids of sulphur and of chlorine which thence resulted acting upon the solidified surface of the new planet; and that, finally, these more or less violent physical and chemical revolutions resulted in the formation of the primitive ocean. * * The mineral acids became neutralized by degrees, and ceased to react upon the newly-exposed rock; and as the temperature diminished, a new disintegrating agent, carbonic acid, became active. This acid, then so abundant in the atmosphere, aided by water and oxygen, and later by vegetable and animal life, though a slower, is a powerful agent in affecting the decomposition of exposed rocks. Carbonates and silicates of alkalies and alkaline earths were in this way introduced into the oceanic waters; and thus a gradual removal of metallic and earthy oxyds, and in some cases of those of the alkaline earths also, was affected. The sulphuric acid, exchanging the oxyds of the earths and the metals for lime, formed a less soluble sulphate, so that the amount present became dependent upon concentration and temperature. The chlorine changed from its combinations with earths and metals only to the equally soluble compounds of the alkalies and alkaline earths. Taking the chlorid of calcium, for example, which thus far has been noticed in every salt deposit of ante-tertiary date, and which must have been therefore one of the original constituents of the ocean from which the salt originated, we find it necessary to believe that the chlorids must have always exceeded the sulphates; since an excess of any sulphate, except sulphate of lime, would have caused the decomposition of the chlorid of calcium. An increase of the chlorids of the alkaline earths, as of calcium and magnesium, and of the alkalies, particularly of sodium, if we may judge from the present composition of the ocean, was the final result of the changes now indicated."

ANOTHER BATTERY.—*Engineering* illustrates a new galvanic battery designed by Mr. Faure, of London, and thus describes it: "It consists of an outer jar containing a solution of common salt, there being immersed in this solution the zinc cylinder or positive element. Within this zinc cylinder, and separated from it by an india-rubber ring, is the porous jar or bottle, which is made of graphite, and which forms the negative element, containing nitric acid. The mouth of the jar is closed by a gutta-percha stopper, and thus, as the nitrous acid vapor is liberated from the nitric acid, it accumulates in the bottle, creating a certain pressure, and forcing the nitric acid through the walls of the jar. By this arrangement the escape of the nitrous acid vapors into the air is avoided, and the constant depolarization of the couple is effected by the continuous exosmosis of the nitric acid from the bottle containing it. Mr. Faure states that his battery gives twice the quantity of electricity of a Grove or Bunsen battery of the same dimensions, and that it also works much longer with the same charge of acid. Mr. Faure's battery also possesses greater constancy and electro-motive force than the nitric acid batteries now in use; and by fitting it with a syphon arrangement for maintaining the supply of nitric acid under pressure, and providing for the removal of the exhausted solution of salt, it may be worked for long periods together. For short experiments, on the other hand, the bottle may be filled with coarse silicious sand to reduce the charge of acid. In conclusion we may state that one of these batteries, rated by Mr. Faure as 'No. 4,' and having a porous jar two and three-fourths inches in diameter by five inches high, will keep three-fourth inch of fine platinum wire red hot for from twelve to fifteen hours."

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Globe.—*Miner*, Jan. 29th: The new drift is now 144 feet long, and running in the white country rock, such as the Tarshish deposit is in, on the opposite side of the creek.

Good Ore.—Two assays were made yesterday of ore from a mine in Alpine. The first, from selected ore, went between $900 and $1,000 per ton. The second, $300.

Good Running.—The first fourteen shifts' work on the Wide West made 18 feet of tunnel of the large double-track size.

M. C.—The No. 3 tunnel of this company is going ahead at a satisfactory rate.

Leviathan.—*Chronicle*, 29th: The lower tunnel is 140 feet, with indications of copper. A few days ago some fine ore—24 per cent. copper—was discovered on the croppings, 400 feet above the mouth of the lower tunnel.

Capt. Chalmers, Manager of the Exchequer Co's mine,—Buckeye No. 2,—is expected about the 7th of February. In the meantime, work at the mine is progressing.

AMADOR COUNTY.

Dunning.—*Ledger*, Feb. 5th: Some few days ago, Billy Boxall and Mr. Dougherty commenced work on the north end of the Dunning & Little mine, in the old cut, and found good pay rock. They are having a hundred tons crushed at the Kearsing mill.

Hinkley.—This mine is being worked by Mr. Averill and his partner, they having leased it. Last week they had 30 tons crushed, which paid $13.50 per ton.

Mining Items.—*Dispatch*, 5th: We learn that the Gwin mine, Lower Rich Gulch, four miles from Jackson, cleaned up over $5,000 the other day, after a run of two weeks. The Casco, two miles from the above, has lately produced rock that inspired fresh courage. A lot of rock from the Hinkley, last week, produced $13 per ton; and a lot from the Dunning is now being crushed. There are a number of other mines that prospect well, but are lying idle for the want of capital. Coney mill is idle, waiting for the company to get through playing "freeze out."

CALAVERAS COUNTY.

Railroad Flat.—*Chronicle*, 5th: Last week John Kendall and partners found a vein over two feet wide. The rock horns out excellent prospects when ground fine. ....The huge boiler at the Petticoat is in position. Sinking in the main shaft will be resumed as soon as the engine can be made ready. At the mill, the outside plates accumulate "cream" rapidly, indicating a yield exceeding expectations.....Chapman & Co., who crushed a large lot of rock at the Hepburn mill, upon cleaning up, found that considerable quicksilver had been lost, including a large percentage of the expected gold.....The Bald Eagle folks are still adding rich ore to their dump....Doe & Freeman Bros., owners of the Essex, are running a tunnel on the vein. The pay ore is five feet wide in places, and is valued at $15 per ton. They have 90 tons at the mouth of the tunnel....Sanderson & Co., after running the lower level to a point under the north shaft, resumed sinking to connect with the level....Jo. Lafoy, near Pennsylvania gulch, upon a lead formerly worked by Mulloy & Co., is to sink 130 ft. before drifting....Wibler & Clark are thundering away at New York Hill with a hydraulic of 300 feet pressure.

Rich Strike at Whiskey Slide.—Edward Wallace has found the extension of the old gravel lead. The ground prospects a dollar and upwards to the pan. The lead when formerly worked above and below, paid enormously. Nuggets were often found weighing from one ounce to fifty.

EL DORADO COUNTY.

Our Mines.—Placerville *Democrat*, Feb. 5th: The South Fork Co. are running the full capacity of their canal, yet there is not sufficient water for but a small portion of the claims that have been proven good, let alone the vast amount of ground which has not been disturbed at all. Ready sale could be had for ten thousand inches of water within a circuit of a few miles of this city. All those who have water are at work and doing well. There is activity in quartz.

Melton & Morey, of Grizzly Flat, from a run of 4½ days last week cleaned up $400.

NEVADA COUNTY.

Mining Items.—Grass Valley *Union*, Feb. 1st: The McClellan's first crushing will take place at Stiles' mill, in Nevada. The miners are down 167 feet and have drifted 40 feet each way. The ledge is from one to three feet in thickness. The first crushing will be 25 tons....Yesterday was the pay day and clean up day of the Idaho. The average is maintained.

Eureka Shipment.—Same of 2d: Yesterday the Eureka mine sent to San Francisco gold to the amount of $25,000. Of this, $4,000 came from sulphurets, and the balance from a two week's run of the mill.

Badger.—Frank Morse has leased the Badger Co's claims, and will commence to take out rock at an early day.

Items.—Same of 3d: Fair Play mine shows good rock and has a ledge from four to ten feet in thickness. The company will commence a tunnel, which will have to go about 200 feet. The ground is favorable. The McClellan rock is being hauled to the mill as it comes out. The crushing commences to-morrow. Fifty tons will be milled. The Blue National Gravel Co. near Greenhorn creek, have a tunnel in 460 feet, and appearances indicate they are near the channel. The bed-rock is pitching. The claims are 300 feet above the mouth of Greenhorn Co's mine. There is no doubt the late reports of the Greenhorn are exaggerated; but no one doubts that it is very rich.

Items.—Same of 6th: The Union Hill mine yesterday sent in $15,000 for its four weeks' run. The Buckham ledge, 15 miles southwest of Grass Valley, is worked by Jones & Co., who have sunk 60 feet. On Friday, a test by mill process, was cleaned up, and gave $25 to the load. The Greenhorn continues to yield rich rock. The tunnel is 175 feet in length and the ledge three feet. The eight-stamp mill is running night and day, and will be cleaned up the first of March. The mill crushes 15 tons every 24 hours. The Town Talk Gravel Co., on the south bank of Little Deer creek, crush their cement, using an eight-stamp battery run by water power. At Finley's, we were shown dust from these claims worth $3,000. It is reported that a rich ledge has been discovered north of the Greenhorn.

Badger Hill.—*National*, Feb. 1st: E. F. Morse has leased the mine for two years, and will have hoisting works in operation within a short time. The Badger has remained idle for three or four years. The ore has paid all the way from $30 to $110 per ton. Work to a depth of 240 feet has been done.

Wm. Penn.—Same of 3d: The shaft is down 200 feet and a drift has been run southerly on the ledge 220 feet. About 40 feet from the bottom of the shaft the ledge is a foot to 18 inches in thickness.

Pittsburg.—*Gazette*, Feb. 2d. The owners have 85 men, and work is pushed with energy. They are taking out rock from four levels, and hoisting from both shafts. The south drift has been completed, and the vein proves 20 inches in width, yielding $40 a ton. They are hoisting 20 tons of rock every 24 hours, enough to keep their 10-stamp mill in constant operation. A $5,000 brick was shipped on Monday, the result of a week's crushing.

The Mills.—Same of 3d: The custom mills have reduced the price of crushing ore to three dollars a ton. Stiles' mill has custom rock enough on hand to last it several weeks. Other mills on Deer creek are having a good supply of ore. The prospects ahead in the quartz line are favorable.

Scotch Flat.—The hydraulic mines are worked on an extensive scale. Ashburn & Co. are using 200 inches of water, and have a medium-sized globe nozzle. Cobb & Co., on the opposite side of the creek, are using a four-inch nozzle, running 250 inches of water, and piping down a bank 100 feet high, of which from 50 to 60 feet is gravel. These claims last year yielded over $4,000 in four months work. The American claims, owned by Jacobs and the ditch company, are running night and day with 200 inches of water. In one run of 10 days they took out $800. Work has been started on the Holmes claims, near Coulson ravine, the ground prospecting well. The Pecktal claims, on the north side of the creek, not worked since 1863, are being fitted up.

Quaker Hill.—Mining operations have been brought nearly to a stand-still on account of failure of water. Jacobs & Co. have fitted up four hydraulic claims, calculating to use 1,200 inches; but it has run down to barely enough for one hydraulic. The claims of the Dutch Boys, and those of Erskine & Co., are worked vigorously.

Union Hill.—7th: The Pacific G. and S. M. Co. (formerly of Union Hill) cleaned up on Saturday $15,100, after 26 days' run. This company now employ 100 men in the mill and mine.

Good.—The Eureka cleaned up on Saturday 1,800 ounces of amalgam worth $6.50 an ounce—the result of 6 days' crushing.

The Season.—*Transcript*, 3d: Up to the present time the total rain fall has been 23.27 inches. One of Tennent's gauges used, the same as in San Francisco, where the fall this season has been about 10 inches. Except in a few places water is plenty, and the loss where it is deficient is more than made up by the continual working of the mines in places where work has to be suspended almost every year on account of the cold. This season we have had few days that were too cold for hydraulic mining in any part of the county, and some of our leading gravel mines, which are suspended during the dry season, are being worked constantly.

The Bloomfield Co.—Six weeks' work is yet to be done at the head of the ditch, before connection is complete between Big and Little Cañon creek. They have everything ready on the ground, and will finish up as soon as the weather allows.

Columbia Hill.—Marks & Co. are running a large flume and cut with sufficient fall to work the Weighel & Co's ground 50 feet deeper. As they need water, work is suspended for rain. The Union Gravel Co. is ready. Woods, Groves and Richardson and the Eureka Lake claims are resting for want of water. Several of these made a run of about two weeks this season. At Grizzly Hill the Jones' and Ohio claims are doing well.

The Strike at Eureka.—6th: For three or four years the Mayhaake Co. have been running their tunnel whenever they had funds, and working for wages when they had not. In the vicinity rich gravel claims had been worked on the surface, but no channel had been found until they struck it. As soon as the news was brought to Eureka, a rush was made, and claims were located all along the extension of the channel on both sides. The gravel is of the finest "wash," and every pan of dirt taken out prospects from 10 to 20 cents.

PLACER COUNTY.

The Good Friday Claim.—The Auburn *Herald*, of Feb. 5th, thus speaks of the mine in which the immense strike, chronicled by us last week, occurred: The claim has been lying idle for months. A short time ago Jacob Cowan, of Auburn, leased the ground for one year, agreeing to pay over to the Ophir Co. twenty per cent. of all the mineral he would take out for one year. He erected hoisting works and commenced pumping out and sinking on the lead. On Saturday last, in a drift sixty feet below the surface, he struck a prospect. On Sunday he kept the pump running, and on Monday, Tuesday and up to Wednesday noon, he had taken out, in specimen gold, what is estimated to be near $20,000. We are informed that the workmen in the drift can see as much gold in the rock before them as they did before this large sum was removed. Considerable excitement has been created in this section of the strike."

Another Strike.—We learn that the purchasers of Edward Walsh's quartz mill, on Baltimore ravine, just below town, have struck rich quartz in the old Crœsus ledge, on the northern extension.

PLUMAS COUNTY.

Mining.—Quincy *National*, Jan. 29th: The late rain storms have furnished sufficient water for some of the miners to commence operations, but should the present fair weather continue, it will not last long.

SHASTA COUNTY.

Paying.—*Courier*, Feb. 5th: We understand that three hydraulic claims now in operation on Roaring river are paying from $5 to $8 per day to the hand. Water is plenty.

SISKIYOU COUNTY.

Good Yield.—Yreka *Union*, Jan. 28th: A Portugese claim near Hawkinsville cleaned up $904 last Friday, as the result of two weeks' sluicing with five hands. An old claim on Greenhorn, which has been worked over half a dozen times, gave a dividend of four dollars per day to the hand for five days' run, last week. Activity now pervades every mining camp in the county, for there is an abundance of water in all the ditches.

TUOLUMNE COUNTY.

The Confidence Mine.—Sonora *Democrat*, Feb. 5th: The ore now being taken out increases in richness. Ten stamps have been added to the mill, making a total of thirty. The yield for the week was 368 ounces of nearly $7,000 value.

Arizona.

Big Bug.—Prescott *Miner*, Jan. 22d: Things are prosperous. The mill stopped for a few days, when larger plates and sluices were put in. A flume was erected, to convey more water to the batteries. The mines are yielding rich ore.

Sale of "Feet."—A. B. Smith sold to Geo. W. Curtis, 600 feet in the Lion lode, for $1,200 cash. The Lion is not far from Noyes & Curtis' 10-stamp mill.

Walker's District.—C. Y. Shelton has dirt that pays eight cents to the pan. Had he a sluice head of water, he could average $10 per diem. The quartz miners were taking out plenty of ore, which they were piling up, in hopes of being able to work it soon. Shelton says he has some rock—a small lot—that will go $2,000.

Mohave County.—We learn that John Moss has succeeded in getting capitalists to work some copper mines not far from Hardyville. The ores are very rich in copper and silver—the former being dominant.

Black Canon.—The placer miners are making fair wages. Water is plenty.

England Gulch.—Seven men are now at work. Charley Williamson Thursday showed us two ounces of gold, which he had just rocked out. It was coarse.

Kirkland Valley.—P. McAteer brought up 40 cents worth of gold dust, the proceeds of two pans of dirt from one of the ravines. He says there is plenty more such in that vicinity, but water is scarce.

The New Bradshaw Placers,—A large party left on Monday with provisions and tools, determined to give a fair trial to the new diggings reported in the ravines that head in Bradshaw mountain. The excitement raised about the strike in Northern Arizona did not last long.

Colorado.

North Clear Creek.—Central City *Herald*, Jan. 26th: Mr. Lake's mill just above Black Hawk, is one of the most perfect in Colorado. The machinery is entirely new. The mill contains 20 500-pound stamps, and three large Bartola pans. At this time, ten stamps are crushing Prize ore, five Missouri ore, and the remaining five are on custom work.

Nevada District.—Four stamp mills are running in Nevada or Bald Mountain. These are Potters & Colley's, Sullivan's, Whitcomb's and Chatfield's. Work on the Hardesty mill goes slowly. Mining continues brisk. The Spark's Bros. have just got through the cap, and the crevice, already eight inches wide, is opening out finely. The ore looks well. Clarke & Co's shaft, the Hidden Treasure, on the California lode, has a very wide crevice, is 175 feet deep, and yields a good profit. The quartz is run in Black Hawk. Captain Phillips is working his claim on the Jones' lode, and is obtaining big returns. We are told he is selling the first quality of ore at $90 per ton to Hill. The second grade ore runs well in stamp mills. The crevice is wider than ever. Cornishmen are working the claim next east of Stalker's, on the California, on a lease. They are taking out a large quantity of ore, nine or ten ounces to the cord. B. C. Waterman and John Eldridge are getting out quartz from the Gardiner lode, and a good profit is realized. Several Cornishmen are doing well on the Ophir Co's claim, on the Kansas.

Idaho.

Chariot Mine.—*Tidal Wave*, Feb. 3d: The lower level is turning out an extraordinary quantity and quality of ore. We are told by competent judges that it shows better than ever before, native gold and sulphuretted silver being visible in almost every square foot for a hundred feet along the vein.

The mine formerly known as the Peck & Porter is giving evidence of permanence that places it by the side of the Elmore and Chariot in point of value. Dave Davis, who has been working on contract, a few days ago suddenly broke through the hard rock into a full two-foot face of soft, rich ore, that gives the mine a most healthy appearance.

Montana.

Unionville.—Helena *Gazette*, Jan. 27th: The new Whitlach 15-stamp steam mill started up on the 24th. Everything worked to a charm. On the Parkinson lode, belonging to the company, the vein is 14 feet wide and the rock of the richest quality. Thirty men are at work. On the claim of the Columbia Co., hoisting machinery and pumping works are going up which will cost $40,000. The 30-stamp mill will start up next week. The claims of the New York National Co. is now yielding ore that surpasses anything ever before taken out. The I. X. L. Co's claim turns out about $5,000 to the run of 10 days. The rock is coming from the 460-foot level. They have 1,000 ton out ahead. Seventy men are employed. The 20-stamp mill of the Hendrie Co. is constantly running.

Jefferson Gulch.—Spranbel & Co. are running a drain to a large flat; will strike bed-rock within two weeks. Ruhl & Co. are running a drain 1¼ miles below. Two men are running a tunnel into a quartz lode at the head of Mattison gulch, and taking out some nice quartz.

The Cedar Creek Mines.—John Ming gives us his experience. The weather encountered on his home trip was intensely cold, and the snow deep. Some of the stampeders had suffered with frozen feet. Oregon gulch is recorded for 15 miles, and no prospect has ever been found; no hole sunk to bed-rock. He recorded a claim as near as possible to discovery, and afterwards found it was 14 miles from that claim. The lower district will not be prospected for many months. There will be in the spring almost a river of water to contend with. In the upper district, he is satisfied there are some good mines. Good prospects have been obtained for six to eight miles. He failed to see any of the very large prospects. Some good miners have 'prospected the same ground. He had known 40 cents and $1.10 to the pan; others five and ten cents. Not a sluice or rocker has ever been run in the gulch, a remarkable fact, considering the mines have been known four months.

Nevada.

COPE DISTRICT.

Mountain City.—Cor. of Elko *Independent*, Feb. 5th: Owing to the storm little work is being done. The Atchison & Drew mill is running as regularly as it can, with a scarcity of wood. Canty's mill is ready for starting as soon as the quicksilver arrives. It is a perfect little beauty. Parties report the Mountain City mine looking better than ever. At the bottom of the shaft, 43 feet, the ledge is nearly seven feet, and the ore of a high grade.

Bullion.—Oppenheimer & Co. received, on Wednesday $2,000 worth of bullion from the Crescent mine,—the product of 24 tons of ore.

ESMERALDA.

Pine Grove.—*Enterprise*, Feb. 1st: A new lead has been discovered six miles southeast of the town, which is very rich. It is called the Dolores. A lot of 109 tons of rock produced 200 pounds of bullion, two-thirds gold. A town called Rockland has been laid out. The Wheeler mine paid during the month $25,000, $18,000 of which was clear profit. The Wilson is yielding an abundance of paying ore, and the mill is kept in constant operation. At the Salt River mine, six miles east, a water mill has been erected. The yield of the district from the 1st of January to the 18th, was $40,000. Capt. Cheevers is opening a portion of the south extension of the Wheeler, called the Cadmus.

HUMBOLDT.

Dun Glen.—Cor. of *Register*, 5th: I promised the result of the working of the first 20 tons of ore from the Alaska mine. The gold caught in the battery was 48½ ounces, worth $14 per ounce. The bullion from the pans is about 1,450 ounces. The Yosemite Co. have struck a new body of mineral, said to be very rich. The tunnel of the Tallalulah is progressing well. The old Natchez mine will start work in the spring.

Battle Mountain.—McLeran & Haskell have all the material on the road for erecting smelting works. The furnaces are the Haskell Patent Iron Furnace, water lined.

Railroad District.—Elko *Independent*, 5th: We hear favorable reports from Railroad. The Brown mine ore returned $95 per ton in silver, and 41 per cent. in copper. The Richmond assays $28 in silver, and 30 per cent. in copper, and is 25 feet wide. The Savage returned from the working of ore, $83 in silver per ton. Ore from the Mountain View assays as high as $250, and shows native silver. South Fork assays $200. A. D. Cope bought 100 feet of the Brown mine for $1,000 in coin.

REESE RIVER.

Bullion.—*Reveille*, Feb. 4th: Yesterday the Manhatten shipped overland six bars, valued at $10,461. This makes upwards of $30,000 shipped by that company during the last three days.

Month's Shipment.—For January, Wells, Fargo & Co. shipped from this city, bullion valued at $82,204.77.

Mineral Hill.—The *Reveille* has seen a certificate of assay of ore from a new discovery, the figures of which were $1,962.42 silver per ton. The holder assured us that the ore assayed "was a fair sample of the entire mass."

WASHOE.

Kentook.—Gold Hill *News*, Feb. 5th: The present daily yield is 60 tons of rather low grade ore, principally from the old upper workings of the west ledge.

Yellow Jacket.—The sinking of the south shaft 100 feet deeper, is being prosecuted with vigor. The mine is yielding 250 tons of ore per day, of high and low grade.

Virginia Consolidated.—Ross & Co. commenced Saturday on a new contract to run a drift west from the shaft, at the 500-foot level to the ledge.

Gould & Curry.—A very encouraging body of quartz, was struck two or three days since in the northwest drift from the 7th level. It is nearly 10 feet in width. The old upper workings yield 45 tons of ore per day; average assays, $37.

Crown Point.—Preparations are being made to get out the low-grade ore from the old upper workings of the west ledge, and ship it to mills on the Carson river.

Chollar-Potosi.—Present daily yield, 145 tons; average assays, $44. The mine shows a general improvement during the week.

Daney.—The shaft is again clear of water and the pump recovered. A promising ledge, 15 feet in thickness, has been struck in the prospect shaft, of which six feet assays well in free gold.

Hale & Norcross.—Daily yield 220 tons. Sinking 100 feet below the lowest or 1,100-foot level, is to be commenced shortly.

Belcher.—Improvement manifest in increased quantity of ore extracted. The Rhode Island mill, so long idle, will be started up on ore from this mine about the 10th inst.

Caledonia.—Large amount of ore on dump. The Gold Hill mill is running on ore from this mine.

Ophir.—The water in the new shaft is reduced to about 75 feet, and is draining from the old mine at a rapid rate.

Overman.—The ore body at the 500-foot level shows improvement in quantity. Present yield 120 tons per day.

WHITE PINE.

Weekly Mining Review.—*Empire*, 6th: Nearly all the mills have been kept employed in reducing ores hauled last fall. In many instances, however, this supply is exhausted. Now that an opportunity is offered to do custom work, we learn of a number of mines preparing to supply the mills. The base metal mines are producing largely. Many new smelting furnaces are being erected, and work started up on a number of mines which have been idle.

Bullion.—The amount of bullion shipped from the office of Wells, Fargo & Co. in this city for January was $105,434.77. The amount shipped the past week was $27,343.04.

Mills and Furnaces.—*Empire:* Alsop works at Shermantown fired up on the first. ....Van Wyck's furnace is being relined, and will resume smelting on Monday.....White Pine Smelting Co. are making a splendid run....The smelting works near the Three-Mile House have passed into the hands of J. E. Magary, of San Francisco, and a consolidation with the Marion Co. has been effected....*News:* Swensey mill shut down for repairs on the 4th....White Pine works just turned out 70 tons of base bullion for two weeks' run.

Items.—*Empire:* Silver Wedge shaft down 59 feet. Struck the ledge at 48, and is still in ore. We saw pieces containing rich chloride and wire silver....Eberhardt ships 22 tons daily....Aurora Consolidated ships 16 tons....Superior ore from Mazeppa....Oswego tunnel is in 60 feet....Manhattan taking out good ore....Blackfoot shaft, on Blue Hill, 70 feet down. Thirty tons of good ore on dump....Work in Hidden Treasure tunnel goes on under contract....The New York Co. owning the Bowers claim has bought the Oregon, and consolidated the two....The Alta mine, lately purchased for the Alsop Co., lowers its ore to the road by a device called the "Telegraph."

South Aurora.—A Hamilton telegram of Feb. 2d says: The month's yield of bullion from the South Aurora mine for January was $64,052.24, principally from the Stanford mill.

Outside District.—*News:* There is a speck of war in Ely. The Pioche mine has been jumped. There came 175 Mormons and jumped the ranches in the neighborhood....Samuel Ferguson of the Roderick Dhu mill, Silver Park, reports everything flourishing....We learn that a mass of horn silver was struck in the Mollie Ruter mine, Cooper District, last week, which surpasses anything of the kind ever seen. The metal is so pure that it cannot be blasted, and the boys were gouging away at it with picks....The *Empire* says that some of the assays of Ely ore have gone above $10,000 to the ton. It also says that a stage load of men with Henry rifles started for that district on the 2d inst.

San Francisco Mining Stock Market.

The mining share market took a somewhat active turn the past week, and very considerable sales of leading stocks were effected, prices for the most part exhibiting a downward tendency. A more than usual number of the various descriptions of stocks were upon the market, and altogether more life prevails among dealers. With regard to the White Pine District, we clip the following from the *News* of the 7th inst.: "Since our last review, bullion shipments aggregate $44,350 72, of which $30,534 81 went East, and $13,715 91 to San Francisco. During the month of January ultimo, Wells, Fargo & Co. forwarded to the East $95,727 13, and to the West, $9,707 64, making a total shipment for the month of $105,434 77 against $74,335 61 for a corresponding period of last year, being $31,099 16 excess. From the foregoing figures it is evident that our bullion is seeking the Eastern market. At present the bulk of the bullion shipments are from Hamilton, and we believe the figures given for January did not cover the shipments from Treasure City for that period. The shipment from this city for January, 1869, was $15,688 60, and for the corresponding period of this year the excess was $89,746 17, the amount being nearly six times as large. The mines show unusual activity, the past week, and some important developments have been made in localities hitherto noiseless. The ridge south of the Eberhardt, and the flat or slope west of the Hidden Treasure may be mentioned in this connection, while the base metal claims along the western base of Treasure Hill are exceeding all expectation. Some of the mills are now crushing ore for $12 per ton, and it is believed that all will come to these figures, or even less. This will enable mine-owners to work at a profit more than 100 mines that have heretofore been idle, and in the course of a few months will add immensely to the bullion yield of the district."

Chollar-Potosi—has been well maintained since our previous issue. During the week closing with February 4th, 1,075 tons of ore were extracted against 1,040 tons the previous week. We learn of nothing new from the old ore localities. At the new shaft the drift is in 62 feet, and is being driven ahead at the rate of 12 feet per day. The ore-slip of the 7th inst. shows that 182¼ tons were delivered to four different mills. The bullion returns for January foot up $115,263, against $76,184 in December. A dividend of $1 per share was paid on the 10th inst.

Savage—was in the market to about the usual extent, at quite a smart decline. The bullion yield for the month of January aggregates $25,560, against $31,670 in December. An assessment of $10 per share was levied on the 7th inst.

Belcher—met with considerable sales. In January, $34,106 27 in bullion was obtained from 1,479 tons, equal to $23 06 per ton.

Gould & Curry—was dull of sale. For the week ending February 7th, 237 tons of ore were extracted, against 312¼ the previous week. The old ore localities show little change. At the seventh station the north-west drift has quartz mixed with porphyry. The vein, thus far, has been drifted across for 39 feet, and no west clay has yet been reached. The tests made by assay with samples of material taken from this locality show no metal. In January the bullion product amounted to $18,238 75, against $28,048 in December.

Hale & Norcross—was more active than the previous week. The yield of ore for the week closing February 5th was as follows: upper mine—175-level, 153 tons; 300-level, 100; lower mine—fifth station level, 50¼; sixth, 1,098; total, 1,401¼ tons, against 1,533¾ tons the previous week. On hand, 6,534 tons, of which 2,485 tons is low grade. The bullion yield for January amounts to $188,334, against $127,162 in December. A dividend of $6 per share was paid on the 10th inst.——**Amador** (Cal.) shows a bullion yield of $63,884 for the month of January. A dividend of $10 per share was disbursed to stockholders on the 7th inst.

Overman—proved dull of sale during the period under review. For the week ending Februry 7th, 738 tons of ore were extracted; previous week, 730 tons. The bullion returns for January amounted to $49,229 25, being the yield of 2,850 tons of ore, equal to $17 27 per ton. ——**Kentuck** disbursed a dividend of $5 per share on the 10th inst.——**Eureka** (Cal.) paid a dividend of $7 50 per share on the 7th inst.—*Commercial Herald.*

The **Stetefeldt furnace** seems to be doing well. The Reno *Crescent* says that "it works regularly and treats rebellious ores up to five per cent. of fire assay. On Thursday we saw Mr. Dunn pay over to Ward & Co., owners of the Silver Queen mine, Mineral Hill, Humboldt Co., $1,500, the net proceeds of five tons and 700 pounds of ore. We are satisfied that it is a magnificent success."

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

Copper in Nevada City.

The Fox copper mine, near the mouth of the Greenhorn, in Nevada county, which was first discovered in 1866, but upon which work was soon suspended, bids fair to come again into prominent notice. This mine now belongs entirely to Mr. John Thorpe, who resumed operations on it last summer, and now at the depth of 230 feet, has developed what bids fair to be a very valuable mine, even in the present depressed condition of the copper market. The operation has been rather a heavy one for one man, with moderate means; but perseverance generally brings its reward.

The proprietors of the Last Chance copper mine, below Rough & Ready, are taking measures to secure a government title to the ground upon which their mine is located, with the view of recommencing work, and erecting machinery upon the same at an early day. Ten tons of this ore, shipped to Swansea, some three or four years since, turned out 28 per cent. copper. There is good reason to look for an early and profitable revival of the copper interest in this State.

New Incorporations.

The following have filed articles of incorporation with the County Clerk, S. F.:

Pioneer Ship-building Co.—Feb. 4. Capital stock, $500,000, in 1,000 shares of $500 each. Trustees: L. C. Watts, Chas. Goodall and Chas. J. Jansen.

Nevada Land and Mining Co.—Feb. 7. Capital stock, $2,200,000, in 22,000 shares. Trustees: R. P. Johnson, W. Meeks, H. C. Kibbe, W. H. Watson and J. Klopenstein.

Butte County Canal and Gravel M. Co.—Feb. 7. Capital stock, $150,000, divided into 15,000 shares. Trustees: S. L. Deury, James H. Fish and John H. Turney.

The following have been recorded in the Secretary of State's office, Sacramento:

Vallejo Savings, Loan and Trust Co.—Feb. 6. Capital stock, $50,000.

Omega Water and M. Co.—Omega, Nevada county. Feb. 7. Trustees: John Herids, Richard N. Tully, Jas. Whartenberry, Geo. W. Kidd and Charles Marsh.

South Yuba Canal Co.—Feb. 7. Capital stock, $600,000, divided into shares of $2,000 each. Trustees: James Whartenberry, Geo. W. Kidd, Charles Marsh, John Dunne and Jacob Rich.

California Coöperative Boot and Shoe Co.—San Francisco. Feb. 8. Capital stock, $100,000. Trustees: W. M. Farrell, Cornelius Sullivan, Ernest Bourguignon, Dennis McSweeney, Jacob Miller, Isedore Lasser and B. O. Donnovan.

◆

The **U. S. Branch Mint** at Dahlonega, Georgia, has been sold. The property, which consisted of a large brick building and ten acres of land, was sold for $1,325. The gold scales and apparatus brought $107. The original cost was about $200,000. The mint has not been used for many years.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Progressive Agriculture.

It has been well and truly said that "progressive agriculture carries a blessing to the future." The progressive farmer builds tasteful dwellings, and so arranges his house as to lighten the labors of his wife. He adorns his grounds with shrubs and flowers, and procures for himself and sons books and periodicals suited to their calling. He thereby makes his home happy, cheerful and pleasant, and ennobles his calling by making it an intellectual one. He is justly proud of his farm, loves it, and teaches his children to love it also. Whatever he does is done for a reason, and not simply in imitation of what his father or neighbors have done for generations before. He makes his fruits and soils a study—he adapts the one to the other; and where Nature has been deficient or slow, he assists her. If his soil is wet, he drains it; if it is light and sterile, he applies the proper manures and adds more tenacious soil—if too much sand prevails, he adds clay; if sour or cold, he corrects by adding lime.

When he puts his son to the plow, he teaches him not only *how* to plow, but why; he not only shows him how to apply such and such manures to such and such fields and crops, but tells him the reason why. He thus makes his pursuit a scientific study, and brings it up by the side of other intellectual pursuits and the professions.

The progressive farmer encourages in himself and family a love for books, and for the beautiful in both Nature and art. He teaches and practices politeness and refinement in his family. Boorishness, rusticity and ignorance, which, in generations past, have been almost synonomous with a farmer's home and life, have no lodgement in the home of the progressive farmer of the present day. *His* sons and daughters have no desire to break away from home and seek for more congenial intercourse and employment in the city.

This kind of farming, as we stated at the outset, is not confined in its beneficial influences to the present time; but to future generations also. It not only adds to the social enjoyment of those most immediately interested; but vastly increases the material interests of the entire people.

The importance of agricultural education to the country can scarcely be estimated. Take the wheat crop, for instance, in any single section. Scarcely one can be found where wheat has been raised for twenty years that has not fallen off *one-half* in its average product per acre! Who can tell the millions of dollars that have thus been lost to this nation in that one crop alone? About the same may be said of the cotton, corn and nearly all the other crops.

There is no reason, as we have frequently written, why American soil should not be made as permanently productive as the soils of Europe. We boast of our improvements in agricultural implements, and with good reason; but the European farmer almost invariably produces the largest crops of cereals, notwithstanding our virgin soil and improved machinery. This is because the English, French and Germans bestow more study and labor upon the use of fertilizers than we do. While we have called to our aid the genius of invention in improving our farming machines, they have paid a greater degree of attention to scientific research into the nature and application of fertilizers. The latter is equally as essential as the former, and it is important that the American farmers, as a class, should be educated up to this fact.

The almond trees in Santa Rosa are in full bloom.

Culture of the Poppy for Opium.

The peculiar adaptability of the soil and climate of California for the growth of the poppy, and the high price and large demand for opium, which is derived from that plant, should favor the production of this drug at home, instead of sending our money abroad for its purchase. Although most of the opium of commerce is obtained from Asia Minor and the region of the Ganges, the poppy grows luxuriantly in almost all parts of the Temperate Zone. It is indigenous almost everywhere within that limit, and flourishes especially in Northern Mexico, and could scarcely fail to grow luxuriantly in Central and Southern California.

It is Easily Cultivated.

This plant, the *Papaver somniferum* of the botanists, is easily and cheaply grown, requiring but little cultivation, while the process of collecting the narcotic juice and converting it into the opium of commerce, is as simple as the most ordinary process in common housewifery. Nearly all the work of planting, gathering and producing the drug can be done by children, male or female. It is a marvel that the Chinese have not long ere this turned their attention to cultivating, rather than smuggling opium. The average profits in the former case would be vastly greater, with no risk of failure. The plant matures very rapidly, and is harvested within 90 or 100 days from planting, and the drug may be ready for market within a few days after it is gathered. In California, by a judicious variation in planting, a continuous gathering might be kept up for three or four months; while in most countries, that labor is confined to the space of three or four weeks.

Leaf and Flower of the White Poppy.

One of the peculiarities of this crop is the fact that it is especially adapted to small farmers. It matters but little, in the rate of profits to the hand, whether a few rods or many acres of ground are cultivated. It must be gathered punctually at the proper time, but its after manipulation can be managed at leisure; for the product is neither perishable nor bulky. It is just the crop to afford employment for families where there are large numbers of children too young for field hands; and it fully answers the question which has been, of late, so frequently and so anxiously asked in this city—"What shall we do with our boys?" A very small tract of land might be made to give light and profitable employment to a large number of children during the entire summer, and furnish ample means to keep them in school through the winter.

The Mode of Culture.

The poppy should be planted in rows about thirty inches apart, and the seed dropped, so as to insure a growth of the plants about eight inches asunder in the rows. A light, loamy, sandy soil is best for its culture—one which can be readily and thoroughly pulverized. The soil should be well dressed with nitrogenous manures. The seed should be covered about one inch deep. The only after cultivation is to simply stir the ground two or three times during its growth with cultivator and hoe. The plant grows to a height of from two and a half to four feet. In very dry soils it is possible that some irrigation may be necessary; although experience *may* show to the contrary. If irrigation is needed at all, it will be just before the plants come into bloom. After blooming, and while the juice of the capsule is being formed, irrigation would no doubt be detrimental.

There are Several Varieties,

That chiefly cultivated at the East is known as the white poppy, so named from the whiteness of its seed. There is another variety known as the black, producing black seeds. The double-flowered white poppy is still another variety. The variety chiefly cultivated in Germany and France is known, from its large growth, as the "giant." Careful experiments in Germany have shown that better results are obtained from the giant than from either of the other varieties.

Different Modes of Obtaining the Juice.

There are two modes of obtaining the juice. The first is by cutting slits in the seed-head or capsule of the plant with the point of a sharp knife, and carefully gathering the juice which exudes.

Another process is to cut off the heads of the plant, grind them to a pomace in a cider mill, and press out the juice in the same manner as in making cider. The former is the process most generally employed and productive of the best results. It is also more simple, and unattended with any requirements for machinery.

Some employ both methods—first cutting slits in the capsules and gathering whatever juice may exude, and afterwards cutting off the capsules and mashing them in the mill. The two products thus obtained are mixed.

Saving and Utilizing the Seed.

The seed of the poppy, in addition to its use for replanting, (as the plant is an annual) is in large demand for the manufacture of table oil. When the capsule is cut off for grinding, as above noticed, it must be done before the seed has ripened or formed its oil; so that in that process the seed is lost. But in collecting the juice by incision, the capsule is not so badly injured but that it will still mature its seed. The seeds are worth, for oil, about one-half as much as the juice for opium. In saving seed for replanting, the plant should not be robbed of its juice, as it is all needed to form a perfectly healthy seed, such as is required for producing a vigorous plant. From what we have been able to learn, too little attention has been paid to this matter—the seed generally sown having been that which has matured in a wounded capsule. We presume the oil mill in this city would gladly purchase all the opium seed which will be likely to be raised in this State at present.

Importance of Bone Elements.—Dr. J. V. C. Smith, in a recent lecture in New York, noted, among other facts in relation to the structure of bones, that the more populous a country becomes, the shorter is the average stature of the people. This is due to the fact that the bone-producing elements of the soil in such countries are becoming gradually exhausted. The exceptional large stature of the natives of some of our Western States is universally attributed to the abundance of lime in the soil. The reverse may be expected where lime and phosphorus (the bone-producing elements) are wanting. This subject has an important agricultural as well as physiological bearing, and one to which too little attention is paid. Ought not lime to be more generally applied to our soil in other ways than in bones?

New Variety of Sweet Potato.—A new variety of the sweet potato has been recently introduced at the East, from South America. It is called the "Southern Queen." The tubers are large, very light colored, and said to be better keepers than any now cultivated in the United States. It is highly spoken of by the *American Horticultural Journal*, for its productiveness and other good qualities. Would it not be well to give the "Southern Queen" a place in our California fields?

"What I Know About Farming."

Mr. Greeley, in his series of articles on "What I Know About Farming," is making many suggestions well worth reading, and which have a very important bearing also, in a practical point of view. Although he is writing these articles mainly for the benefit of young people—young beginners in farming—there are many not so young who might read them with profit. In his fourth number he addresses his young friends as follows:

Our boys are in too great hurry to be men. They want to be bosses before they have qualified themselves to be efficient journeymen. I have personally known several instances of young men, fresh from school or from some city vocation, buying or hiring a farm and undertaking to work it; and I cannot now recall a single instance in which the attempt has succeeded; while speedy failure has been the usual result. The assumption that farming is a rude, simple matter, requiring little intellect and less experience, has buried many a well-meaning youth under debts which the best efforts of several subsequent years will barely enable him to pay off. In my opinion, half our farmers now living would say, if questioned, that they might better have waited longer before buying or hiring a farm. * * *

To every young man who has had no farming experience, or very little, yet who means to make farming his vocation, I say, Hire out, for the coming year, to the very best farmer who will give you anything like the value of your labor. Buy a very few choice books (if you have them not already) which treat of geology, chemistry, botany, and the application of their truths in practical agriculture; give to these the close and thoughtful attention of your few leisure hours; keep your eyes wide open, and set down in a note-book each night a minute of whatever has been done on the farm that day. At the year's end, hire again to the same or another good farmer and pursue the same course; and so do till you are twenty-four or twenty-five years of age, which is young enough to marry, and quite young enough to undertake the management of a farm. * * *

I have high regard for scientific attainments; I wish every young man was thoroughly instructed in the sciences which underlie the art of farming. But all the learning on earth, though it may powerfully help to make a good farmer, would not of itself make one. When a young man has learned all that seminaries and lectures, books and cabinets, can teach him, he still needs practice and experience to make him a good farmer. * * *

He who has already mastered the art of farming, and has adequate means, may of course buy a farm to-morrow, though he be barely or not quite of age. He has little to learn from me. Yet I think even such have often concluded, in after years, that they were too hasty in buying land—that they might profitably have waited, and deliberated, and garnered the treasures of experience, before they took the grave steps of buying their future homes, with regard to which, I shall make some suggestions in my next.

Effects of Cooling Milk.—Careful experiments have shown that there is a difference in the butter yield of milk of from 20 to 30 per cent., dependent upon the manner of setting and cooling it for obtaining the cream. The lowest percentage is obtained when the milk is put away upon wooden shelves in a moderately warm, unventilated room—the highest when it is placed on stone shelves in a cool, well-ventilated spring-house. Polished marble shelves, in a well-ventilated spring-house, with running water forming a cascade, with glass or finely glazed earthenware pans, are probably the best conditions for obtaining the largest yield and finest quality of butter, from any given quantity and quality of milk.

Germany Looking to America for Choice Small Fruit.—Catalogues are published in Germany in which many of the choice small fruits produced in America are advertised. This fact is noted as evidence that foreign countries are beginning to use our small fruits, and as looking to the possibility that America may, ere long, become fully as much an importer as exporter of such products.

Proper Cultivation for Our Climate.

[Written for the Scientific Press.]

Editors Press:—Many agricultural writers seem to have confused ideas in regard to the conditions most favorable to capillary action. This is not surprising, when we find in text books on philosophy conclusions so much at variance with the facts presented. According to Professor Leslie, the facts are these:

"If a soil of gravel contains pores the 100th part of an inch in diameter, water will ascend in it by capillary action something more than four inches, and supposing the particles of coarse sand to have interstices of the 500th part of an inch, the water would rise through a bed of sixteen inches; and if the pores were diminished to the 10,000th part of an inch, water would rise twenty-five feet and a half."

And here is his conclusion:

"Hence, in agriculture, are derived the advantages of deep and perfect tillage; since the more effectually a soil is pulverized, the better fitted it is to *raise* and retain moisture near the surface."

Quite the contrary, for according to his facts, deep and perfect tillage must destroy the condition in the surface soil most favorable to capillary action, and not only prevent the water from coming to the surface, but it at the same time prevents the heat of the sun penetrating the earth. Uncultivated soils, in this climate, are already packed as closely as their nature will permit, from the surface downward, and for this reason moisture is retained at the surface, by capillary action, to be evaporated by the heat and drying winds, until the supply is exhausted to a great depth, which must vary with the character of the soil. A fine clayey soil is capable of raising the moisture from a greater depth than one less compact.

In our climate, the unbroken subsoil should always be within reach of the roots of the growing plant, otherwise, when the heat of summer arrives, it might fail to mature for lack of moisture. Hence the depth of tillage should vary with the character of the crop and the period of its arriving at maturity.

The beneficial effects of subsoiling, chemically, are no doubt as great here as in other parts of the world, but mechanically, it must render the soil unfit for maturing such crops as do not root deeply, at least until the soil has had time to repack. For small grain, it may be doubted if the best average results can be obtained on ground recently subsoiled, unless the crop is to be cut for hay. It should be the aim of agriculturists to stir the soil deep enough for a mulching, for other field crops. For moist soils and situations, six or eight inches will be a sufficient depth. For such crops as mature early in the season, a less depth will answer. In most localities in California, where there is depth of soil to absorb all the annual fall of rain, were a system of cultivation adopted with the view of retaining the moisture as long as possible, the supply would be found sufficient for the maturity of any crop, if planted at the proper season. F. A. H.

Remarks.

The question of deep or shallow plowing has excited a large amount of discussion within the past year or two, and has been the subject of much careful experimentation for many years. The facts elicited seem to point to the circumstance that there are soils which, from peculiar character of subsoil, will do better with shallow than with deep plowing, while there are others that require deep plowing. If you have hard-pan under clay loam, and are expecting drouth, plow deep enough to loosen the top of your hard-pan, so that the roots of your crop may effect an entrance into the same for the moisture that they will fail to find in the loam. With a sandy soil and subsoil, there is not so much necessity for deep plowing, from the fact that the roots will find their way down to the moisture through the *naturally* loose subsoil. This question also depends much on the nature of the crop which it is proposed to raise—whether it is such as naturally sends roots down deep or otherwise. On this coast, early plowing, as a general thing, should be deep; later plowing may be shallower. There is one other advantage derivable from deep plowing, of much importance in California and all other countries that are divided into wet and dry seasons, which is more particularly referred to at the close of these remarks.

Many argue that three inches is deep enough for ordinary soils, especially for corn, which does not send down deep roots. The best practical experiments seem to show that the plow should never run less than six inches deep. No fixed law can be assumed for all cases. Individual experiments should be the guide, and every farmer *should* experiment.

There is one very important matter that seems to be too generally lost sight of in plowing—the aeration of the soil. Our correspondent, "F. A. H.," does not appear to take this matter into account in his communication. A proper aeration of the soil is a matter of vital importance, especially in the germination of seeds. Every increased inch in depth of a proper pulverization of the soil introduces an additional million and a half cubic inches of air to the acre, which, in a moist atmosphere, even without rain, adds a vast amount of moisture to the soil, on the general principle of the diffusion of gases—the moisture in the atmosphere being in the form of a gas. We propose, at an early day, to call particular attention to this matter by the aid of illustrated diagrams.

The remarks of our correspondent, with regard to the retention in the soil, so far as possible, in this country, of the rains of winter, instead of allowing them to flow rapidly away, is of more importance than is generally supposed. This might be greatly aided, in some localities, where natural facilities are offered, by the erection of dams and reservoirs. Deep plowing greatly aids in this matter, as by the loosening of the subsoil the rains are better able to penetrate deep into the ground, to be there held until the approach of the dry season, being then drawn up to the plant roots by capillary action.

Preservation of Apples.

The London *Gardener's Chronicle* says: "He covers the floor of his cellar with hurdles, two in thickness, and on these he puts a little straw, upon which the apples are placed without further care or attention, except removing all that seems to be faulty as he places them in the cellar, and he thinks it is unnecessary to use any particular care in this respect. He has at present a hundred and ten bushels of apples thus heaped up in his small cellar; two or three times a week he gives a good wetting with fresh water, as much as he thinks will wet the whole of them. This water drains off through the straw and hurdels into a well. In this way his apples keep well until the time he usually disposes of them; the best to make him a good return after Christmas. At present the apples look as well and as firm as if just gathered, and I understand that, during the last ten years, they have always kept just as well and as fresh as now.

How much less troublesome and easy of application for keeping large quantities of fruit, than storing them away in dried sand on shelves, or in boxes, or in any other of the ways highly recommended."

We could never see the philosophy of storing apples in a *dry* place, where the moisture must be rapidly taken out of them, leaving the fruit to shrivel up and lose its fresh and crispy taste. True, moisture generally induces decay; but the peculiar manner of its application, as described above, in connection with perfect drainage and ventilation, militates against the action of the spores of fungi, to which decay is generally due, and very probably may result as described by the *Chronicle*. Will not some of our orchardists give the above plan of preserving apples a trial, and report the result to the Scientific Press?

Small Fruit Cultivation and Other Matters in Alameda.

[Written for the Scientific Press.]

Gooseberries.

Editors Press:—Mr. P. F. Marston called my attention to 175 gooseberry plants, which he took charge of at three years from cutting. Thorough cultivation had previously been neglected. He gave them proper attention, and the first season the fruit netted him $50; the second $100; and the third—last year—$125. These plants are growing in an orchard between rows of apple trees, and probably did not produce over two-thirds what they would had they the entire ground to themselves.

Another gentlemen,—Mr. J. V. Webster,—gave me much information as to his system of cultivation. I venture the assertion that not one farmer in a hundred is so thoroughly systematical, economical and enterprising, as this gentleman. He showed me a lot of fine gooseberry bushes, growing in his orchard, which he had trained in different styles. His experience is, that it is better not to prune at all, excepting to remove old decaying wood. When pruned in tree form, the wood in the stock gets hard and brittle, and it is liable to get twisted or broken off, and the yield of fruit is not equal to the bush when naturally trained. A fine lot of bushes that he has not pruned for ten years, are certainly superior to any that I have seen. He assured me that 180 bushes, not pruned, yielded last year 1,500 pounds of fruit. He says they stand shipping better than any other fruit, and may be sent to the States with perfect safety, and that what with using green, with canning and sending East, the business of raising gooseberries cannot soon be overdone.

Currants.

Mr. Webster thinks that the only pruning necessary for currants, is to cut out the side branches that lay on the ground, and head in the leading upright stems. I will here give some minutes of the experience of Mr. Haile, of Alameda. Three years ago he set out 500 cherry-currant cuttings. The first year he picked fourteen pounds of currants; the second year, 380 pounds; the third—last year—they yielded 1,650 pounds. The land on which the currants and gooseberries were grown is, in every case, light alluvial soil, and thoroughly cultivated.

Blackberries.

Mr. Webster has four acres of the finest blackberries in the State. The plants stand 5x8 feet apart. He says they should be no closer than 5x10 feet. They are set on light, loamy soil. He does not plow among them, but runs the cultivator through about ten times during the year, and keeps the weeds hoed away from the vines. He allows from one to three shoots to grow in every hill, and don't let them get over three feet high. His vines are finely branched, and yield fruit that commands two cents per pound more, in the same market, than any other lot of blackberries. By keeping the weeds, and stirring the soil in the spring, his berries ripen two weeks earlier than in vineyards where such cultivation is neglected. Mr. W. cultivates the Lawton blackberry, and thinks the Kittertinny not so good. The second year he got 13,500 pounds from his four acres; this year he calculates to have not less than 30,000 pounds from the same piece.

A Grain Field—Benefits of Fallowing.

Mr. Webster cultivates a grain field which produces a better yield now than it did fifteen years ago. He seeds but half of it down every year, and gets more hay and grain from it, and at a less expense—besides keeping his ground "in heart"—than he could by sowing it all yearly.

His manner of fallowing is this: When the grass and weeds on the stubble field get a foot or two high—say in February or March—he plows the green crop under. Then he cross plows again in June. This leaves the land in excellent condition to receive the seed the following winter. Thus he alternately sows and fallows each half yearly.

Piscatorial, Etc.

Mr. Webster, of Alameda, has made preparations for a fish pond. Near his house there is quite a large circular bend in the creek running through Fruit Vale. He has made a sort of a "Dutch Gap Canal" cut-off by fluming through the narrow portion of this neck of land, and his dams are so arranged that he can supply or draw off the water at will. His pond is the old circular bed of the stream, with sloping banks and shady grove. He intends stocking the same with Lake Bigler trout. Another item worth noting is the fact that he has so arranged his flumes that he can catch a hundred loads of float gravel and sand every year, worth as many dollars.

It is certainly refreshing to meet now and then, and be entertained by gentlemen of intelligence and frankness,—of manly sense, free to impart and ready to receive, such ideas, thoughts and experience, as the light shines upon; especially when one meets in his travels with so many who shrug their shoulders, when questioned upon subjects which they profess to be acquainted—as much as to say, "I know this, but I am not fool enough to tell you." Such narrow-minded, selfish and conceited souls are welcome to all they do know, and to my liberal opinion of them besides. The world moves on—man moves it, and moves with it, or remains a dead weight on the wheels of time—a sordid, cumbrous passenger of fate.

Milk Dairy.

Calling at the ranch of William Kennedy, I found him milking thirty cows. The breed which he keeps is a cross between the Durham and Ayershire. He thinks this the best for milk stock; the cows are large, hearty eaters, and fine milkers. His cows yield 100 gallons of milk per day. This, he assures me, is one-third more than the average of "swill-fed" stock. He feeds only hay and grass in its season and vegetables—very seldom meal, and never slops. His cows are always healthy, and the milk is pure. He raises all his heifer calves, and selects his cows from them.

Beets and Carrots.

He cultivates what vegetables he uses. Sugar beets are not profitable, only twelve tons of them to the acre can be raised, where twenty tons of the mangle-wurtzel beets grow. The sugar beets have to be cut, and these sometimes choke the cows. The mangle-wurtzel can be fed whole, and without danger. He also cultivates the white Belgium carrot, which will yield fifteen tons, or twice as much as any other sort. This, like the stock beet, grows one-half above ground, and is easily gathered.

Poultry Business.

I was intending to make some jottings under this head, but will have to defer it until another time. H.

Notices to Correspondents.

J. D., Virginia, Nevada.—The ton of copper ore is reckoned at 2,352 pounds by English and American smelting works, being a custom which still survives from earlier times; but in shipping ores to England, a certain deduction is made for draftage. To obviate any difficulty in this respect, some agents here call a ton 2,376 pounds, which, after deducting draftage, amounts to 2,352 pounds. The silver is paid for extra, but there is no determined rate. One party pays for all silver over $50 per ton, another for all over $30, and the same party may pay differently at different times.

J. B., North Branch, Calaveras county.—If F's partnere gave him no notice of the meetinge (as you say) by publication or otherwise, they have not the right to sell his claim.

How the Coöperative Plan Operates in the Foundry and Machine Business.—Six months ago the Miners' Foundry commenced working on the coöperative plan, after the following manner: The workmen furnish all the material and do the work, paying to the shop a percentage on all the work done, the proprietors giving their time and influence in procuring and superintending the work. The working capital for paying for materials is arranged as follows: Each workman leaves his first month's labor as capital stock, and all they realize over the current wages remains to augment this. The total amount of original investment in this manner was $1,826, and in the first six months, after paying themselves the highest current wages and the percentage to the shop, they have added to their capital stock $1,763, nearly 100 per cent., which can be divided whenever the directors think advisable or remain as working capital.—*Bulletin.*

We are glad to hear that this experiment has succeeded so well. We are inclined to believe that the presence of one or two (if not more) of such associations will put an end to the evils arising from strikes, as thereby the pricee of wages will be regulated to a great extent, the workmen themselves seeing how much or how little they ought to receive in fairness to the interests of the proprietors. In such a work each man will be on the look-out to stir up the drones, and make all do their share of the labor. Thus also will be shown how much a fair day's work is. We believe that the benefits will extend in these ways also to other establishments.

◆

There is a rumor that work will soon be resumed at Mare Island.

The Fence Law.

The question of fence or no fence has lately been agitated in this State. As in all questions, there are two sides, each of which should be viewed with impartial eyes. Two important interests are concerned in the settlement of the question; on the one side that of the farmers, on the other that of the stock-raisers. The subject is to be brought before the Legislature, and there it must be decided whether it is more to the interest of the State to compel farmers to fence in their crops or the stock-raisers to have keepers for their cattle.

The expense of building fences and keeping them in repair is certainly a very heavy tax on farmers, and this especially so in those districts where timber is exceedingly scarce and the lumber must be transported long distances at a great expense. It is estimated that the annual cost of repairing the fences around the 18,000,000 acres of Ohio amounts to over $7,500,000, or between forty and fifty cents an acre. The original cost was over $6 per acre. The numbers for Ohio are much smaller than they are for our State. The tax is, then, enormous for the farmer; and, compared with this on the other hand, the expense to the stock-raiser for keeping his cattle within bounds is comparatively small. From this point of view the argument is greatly in favor of a "no-fence law."

There is, moreover, another point to this question. Is it right, morally or socially, to compel the farmer to build, at such an expense, a fence which he needs for no other purpose than to guard against the aggression of somebody else's cattle? or, in other words, is it right to compel the farmer to build the stock-raiser's fence? We can see no legal nor any moral reason for this, especially when we consider that the expense is greater for the former than it would be for the latter.

We confess that, to our eyes, all justice and reason seem to be against the fence law. The farmer is never the trespasser. His grain is immovable and cannot infringe on the property of the cattle-owner. To compel him to fence his crops, is to lay a tax on his land, which tax often amounts to many times the value of his farm. Is there any question as to whether the trespasser or the trespassed should be punished?

Hedges are practically impossible in the majority of cases, although it is strongly urged in some places. The osage orange seems to make the best hedge—that is to say, under proper conditions; but this requires considerable care and attention, must be trimmed and pruned, and requires, moreover, five to six years to make a proper fence. We do not believe that farmers can spare the time therefor, all their attention being needed for their crops. The cost of these, and the trouble of growing and maintaining them in most districts, put them out of the question.

We join, then, with the farmers, in calling for a repeal of the fence law, or at least in all counties where it is felt to be onerous. However proper or necessary such a law may have been in the earlier days of the country, it is no longer anything but a detriment to our State at present. The value of land is greatly diminished and immigration and settlement retarded thereby. The law should make the stock-owners liable in damages for any injury caused by their stocks. Perhaps the present state of things are the best for a few grazing districts, but in general legislation for the whole State, a change is imperatively demanded.

◆

Oil Cake.—We learn that the oil cake made at the Pacific Oil Works is continually increasing in demand. Milkmen are said to find it the most valuable food for their milch cows, by its use both the richness and the quantity of the milk being greatly increased.

The Loud-Cole Patent Case.

An interesting contest with regard to a patent of an improved propeller, has been going on for some time between Mr. A. C. Loud, a merchant of this city, and Senator Cole, in which decisions—by Chas. Everett, Examiner, by John M. Thacher, Examiner of Interferences, and by J. H. Hodges and S. C. Fessenden, Examiners-in-Chief—have been rendered in favor of Mr. Loud. We have just received word, however, that on the last appeal Mr. Cole has been successful. The case involves points of interest and importance to inventors, and we propose to go over a part of the contested ground.

Mr. Loud claims that in October, 1868, he left San Francisco, and went on to Washington to get a patent on an improved propeller, that he visited Senator Cole, who became much interested in the invention, and went with him to the Commissioner of Patents. The patent was allowed in the beginning of November. Afterwards the two went on to New York, (Loud having instructed his agent to have his models and papers remain in the secret archives at Washington), and there experiments were made with a small steamer. The wheel did not answer the purpose as well as was desired, and changes in the construction were found necessary. Winter came on, and the cold weather determined the parties to lay the boat up until spring. Business compelled Mr. Loud to return to California in December. While at New York, a verbal contract was made by the two parties to the effect that the Senator should pay the expenses of the experiments, etc., and should receive therefor a quarter interest in the invention. Various minor arrangements with regard to making improvements, etc., were also settled, and it was decided to take out a new American and foreign patents.

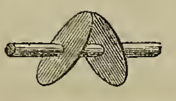

Fig. 1.—As Experimented With.

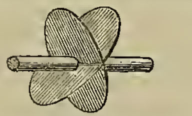

Fig. 2.—As Contested.

On the voyage home (by steamer) Mr. Loud, while thinking over the matter, decided that a different construction of the wheel which he had invented originally, and of which he had made a pasteboard model in or before September, 1868, would be an improvement, although he had before thought differently. He went back by rail within five days, to show the model to Mr. Cole, and ventilate the matter. On arriving at Washington, he found that the Senator had changed his mind with regard to the previous arrangement, had taken Mr. Loud's papers from the secret archives, paid the final fee, and made them public, contrary to instructions, and had himself taken out a patent for a new form, which was identical with the one Mr. Loud claimed as his original one. Mr. L. immediately applied for a new patent, Feb. 3, 1869, and in this an interference has been declared, with a similar application of Cornelius Cole.

Senator Cole does not contradict this statement, except as regards the priority of invention, and argues that even had Mr. Loud invented this form, he had forfeited his claim by not exercising reasonable diligence in adapting and perfecting the device.

We have before us the decisions referred to at the beginning of the article, which touch on these points on which alone the decision turns.

The Primary Examiner states that priority of invention is awarded to Mr. Loud, his assertions having been proved by witnesses. The Examiner of Interferences states the same, and says: "Any different conclusion must be accompanied by a decision that all the witnesses referred to are guilty of swearing to outrageous lies, thereby deliberately and shamefully committing perjury. Such a decision I cannot make in the absence of any proof to sustain the same, not a single contradiction as to the invention having been attempted, save in a single instance with Loud, which is based entirely upon his silence as to the said invention while in New York." The Examiners-in-Chief say "the conclusion is *unavoidable* that Loud had conceived it months before his antagonist."

In regard to forfeiture of claim by abandonment, the decisions are strong that there is no ground for this objection, and the Examiners-in-Chief say of the two forms of wheel, "the two forms were evidently regarded as modifications of the same invention by Loud, and *very justly.*"

Here, then, we have it affirmed in an emphatic manner by the Examiners that, by the mouths of competent witnesses, whose testimony is positive, clear and unimpeached, it is proved that Mr. Loud invented the contested article, and showed a model of it long before the Senator claimed to have thought of it; moreover, the new construction was identical in principle with the older form. We give sketches of both, that our readers may see the force of this:—"Both operate upon the principle of a scull, though the crossed disk have also the operations of buckets to some extent. They were so far cognate, that a man may well be considered as engaged in maturing the invention, while employed on either."—*Report of the Examiners-in-Chief.*

In the face of all this, we are at a loss to understand how a different conclusion can have been arrived at in the last appeal. We must delay remarking on the case definitely, until we have a full report of the decision; but we cannot refrain from expressing wonder in view of the positive testimony of Mr. Loud's witnesses, whose character have always been considered above suspicion.

◆

A Full List of Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending February 1st.

Composition for the Manufacture of Water, Gas and Drain Pipes.—William P. Kirkland, San Francisco.

Table Fork.—James Patterson, San Francisco. Antedated Jan. 29th, 1870.

Driven Well.—Isaac Trump, San Francisco.

Spark Arrester.—Edward Waud, Eugene City, Oregon.

Gang-Plow.—Samnel Welch, Belpassi, Oregon.

Pruning Knife.—Henry Alter, Lakeport, Cal.

Extension Bedstead.—Frederick Menzer, San Francisco.

Swivel Shackle.—William Williams, Vallejo, Cal., assignor to himself and Daniel Harrington, same place.

Paddle Wheel.—Adam Wingard, San Francisco.

Division A.—Needle for Sewing Machines.—Hannah G. Suplee, San Francisco.

Division B.—Needle for Sewing Machines.—Hannah G. Suplee, San Francisco.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

◆

Freezing Mixtures.—We have received a list of several freezing mixtures from Mr. Paul Schumacher, of this city, which, however, have previously appeared from time to time, in our columns. Mr. S. has paid considerable attention to this subject, and has invented several methods, some of which he has patented.

Proposed Mining Incorporation Law.

We published in full last week a bill with regard to mining incorporations (prepared by the Stock Board of San Francisco), which is to be presented to the State Legislature; and we proposed to comment on the bill this week, not having space in our last issue. The main points, it will be remembered, are these: 1st. Vesting corporate powers in the stockholders, and giving a majority of them the power to remove any officer of the company. 2d. Compelling the trustees to make a full statement of the financial condition of the company every three months. 3d. All rock crushed to be let out to public competition and contract, unless worked in a company's own mill. 4th. No contract to be let for a longer time than three months.

The object of the bill is to protect the stockholders of certain companies (particularly of some owning mines on the Comstock lode) against the pernicious power now held by the "rings," which manage the affairs of the companies entirely for their own pecuniary benefit, without any regard to justice or the rights of the "outsiders." For this purpose the law is to be amended so that quarterly statements must be made, thus enabling stockholders to know the actual situations of affairs (whereas, in many instances, no information can be obtained, except at the yearly meetings, under the existing state of things), and to prevent the letting of fat contracts to favorites at high prices, to the manifest injury of the interests of the company. The avowed object is most praiseworthy; and could the measure be enforced with regard to certain mines, and these only, it might be well. But there are fatal objections to making this a general law.

As other incorporations are required to make reports from time to time, showing their financial situation, it would seem but fair that mining companies should do the same. This of itself will do much towards preventing unjust and dishonorable management, without injuring those concerns which are properly conducted; and we have no objections against the section relating to this point. But the last sections, regarding contracts, are entirely inapplicable to a great majority of cases. Limiting all contracts to a duration of three months is absurd, because practically impossible. No one will take a contract for tunneling, or similar work, or for rock-crushing, for three months only when so liable to lose the job at the end of that time. And to compel all mines to advertise so often for new bids and to take the highest, no matter how satisfactorily the work has been done previously, is rendering them liable to considerable expense, delay, and often loss, which may be fatal in many cases, and which is entirely unnecessary in most.

It is preposterous to attempt to regulate all incorporations by specific measures, which may be necessary to control the dishonest officers of a few, especially when the latter object can be effected in other ways. If the brokers really desired to benefit the public, they might exclude from their Board all operations which evidently are unfairly conducted. The gentlemen perfectly well know how affairs have been and are managed by the cliques. Why, then, recognize them?

With regard to mining incorporations in general, the latter sections of the bill are exceedingly onerous and entirely useless. With regard to the few to which they are intended to apply, we do not believe they will accomplish anything. And if all loopholes of evasion are stopped up, and such a law vigorously enforced, the only result, we think, will be that the companies in question will migrate to Virginia City or elsewhere outside of the State, leaving the measures to apply only to those for whom it is not only unnecessary, but even useless and detrimental. We are in favor of anything which may put all mining on a footing of an honest and well-conducted industry. But with all due respect for the Stock Board, we cannot believe that those gentlemen—whose only connection with mines and mining companies is for the purpose of speculating in stocks—are exactly the persons best qualified to make laws which are to govern legitimate mining operations.

The great curse of the industry and the real *root* of evil from which such improper management has sprung, is speculation. It is this which has sapped our resources and undermined our credit, and which has produced similar results in all countries. No measures for cutting off the branches will be effectual while the root is permitted to exist. So long as people will indulge in indiscriminate stock gambling, so long must we hope in vain for the discontinuance of dishonesty and roguery. Shall we learn of ourselves to consider mining a *legitimate business*, or must we wait first for another grand crash to teach it us by its bitter experience?

Legislative.

It is proposed by Senator Betge that the State shall issue bonds to defray the expenses of carrying water from Lake Tahoe to San Francisco, to supply not only the city but also intermediate points with water for household, mining and agricultural purposes. The idea is not bad, but the sum of $10,000,000 is *rather* a large amount to be put into one bill.

Mr. Minis' bill for the encouragement of agriculture provides for a premium of $10,000 to be paid to any person or persons who shall within three years introduce into the State ten steam plows, each capable of plowing and seeding forty acres of land per day. For the introduction of forty of these plows in the next four years a premium of $100,000 is to be paid. The Board of Judges to award the premiums consists of the following persons: The Governor; President of the Mechanics' Institute, San Francisco; President of Agricultural, Horticultural and Mechanical Society of the Northern District, and the President of the San Joaquin Agricultural Society. We have previously expressed our ideas with regard to such a bill, in remarking on the excellent measure proposed by Mr. Perkins, which seems to us, in many respects, the more rational of the two.

The resolutions in the report of the Committe on grape culture (asking for modifications of the internal revenue exempting fruit distilleries from the operations of the provisions applying to malt and grape distillers) were adopted in the Senate.

Congressional.

In the National Congress, the House Committee on Public Lands reported in favor of allowing the claims of Messrs. Hutchings & Lamon in the Yosemite. The claim is laid out so as to extend from side to side of the valley, but nevertheless, if the gentlemen are right, they should receive full justice. The State Legislature should make every effort to purchase their claim.

Mr. Wilson introduced a bill to release Goat Island from Government reservation. The title to the island is claimed by three different parties. Mr. Cassorly offered an excellent resolution, which was adopted, instructing the Committee on Public Lands to consider the propriety of enacting a law for a general system respecting the public lands of the United States in California, and for distributing the same into different classes; the first to consist of agricultural lands of the first quality; the second class, of all other agricultural lands; the third class, of pasture lands; the fourth class, of timbered lands of the first quality; the fifth, of all other timbered lands; the sixth class, of lands bearing gold, silver and quicksilver; the seventh, of lands containing any other metals or minerals; and, if the said Committee shall find it proper, to report a bill accordingly.

We shall give an article next week with regard to the sale of ores and their crushing and sampling in this city.

Our Home Industries.

The Flour Interest.

The most extensive flour mills of California are situated in this city, and their brands have the best reputation, and have, to a very large extent, supplied the export trade. California wheat is so dry that flour made from it bears transportation to any place on the globe with safety; and as long as the California millers continue to use care in the production of a strictly good article, so long they may expect to lead other lands.

The principal flouring mills in San Francisco are the Capitol, Commercial, Genessee, Golden Age, Golden Gate, National, Pacific and Pioneer, all of which enjoy a high reputation. We inspected one of the largest, if not the largest—the Golden Gate—this week, and satisfied ourselves with regard to the care exercised by our city millers in preparing this important article of sustinence.

Cleansing the Wheat.

The wheat is brought in sacks to the mill, and the first step is to clean it of the various foreign substances, such as straw, sticks, strings, dust, etc., which add to the weight without improving the quality or supplying nutriment. For this purpose the wheat is passed over a variety of screens and subjected to the action of air-separators, in which last, by a properly regulated current of air, the lighter substances are carried off, while the heavier grains of wheat fall into proper receptacles. After undergoing these processes, which are varied and modified in different mills according to the ideas of the several proprietors—in order to clean the grains from any dust which may still adhere or from any smut, the grains are passed through the "smutter," which (at the Golden Gate) is a vertical cylinder of chilled iron, in which revolves a shaft, which is provided with wings or some similar arrangement, which revolve from four to six hundred times a minute. The wheat is introduced at the top, and, in falling through, is violently tossed about and thoroughly scoured. A draft of air passing upward carries off the fine impurities.

Grinding the Wheat.

The wheat now goes to the mill-stones. These form a very important part of a mill, and are made with great care. The best material known is the French Buhrstone, a silicious rock, found interstretified with the sands, marls and sand stones of the Paris basin, which is excellently adapted for the purpose on account of its regular cellular structure and extreme hardness. The lower stone is fixed, the upper revolves. These stones are not made of one piece, but of a number of parallelopipeds, which are nicely fitted together and held by cement and by iron bands. The face only is made of the expensive buhrstone, which is backed with plaster to give the whole the necessary weight. One of these stones weighs some 2,400 to 2,800 pounds. The faces are furrowed, the manner of which varies according to each miller's ideas. The stones vary in diameter from 3½ to 4¼ feet, and a pair of a 4-foot diameter cost about $300. In the case of the smaller millstones, the lower stone often revolves.

There is demanded very considerable skill in adjusting these stones so that they will revolve steadily and evenly, without dipping to one side or the other. So accurately are these adjusted, however, by experienced workmen, that it is almost impossible for one on entering a room where some are in rotation and others at rest to tell which are revolving and which not; and so evenly do they run that a knife blade may be inserted between the upper and lower stones, when just far enough apart for admitting this without touching both sides, and the blade will not be scratched.

When in use the stones are inclosed in a light cover, the grain is introduced into a hopper above, and fed by automatic feeders through the center of the upper stone. The centrifugal force, and the direction of the furrows, throws the ground meal out at the circumference.

Bolting, Packing, Etc.

After being ground, the meal goes to the bolters. These are hexagonal sieves, 28 to 40 inches in diameter, and 16 to 20 feet long. The bolting cloth is made of the finest silk, which is imported from Holland. The sieve lies nearly horizontal, with only such inclination as is necessary to make the substances which do not sift through the cloth gradually pass from one end to the other, where it is discharged, and is retreated in separate mill-stones to extract as much flour as possible. The bran is cleaned and sold for feeding cattle principally. The flour is packed in sacks and barrels for the market.

The microscope shows us that a grain of wheat is made up of several easily distinguished parts—the outer coat or bran, the middle coat, and the germ. Chemistry shows us that the bran contains iron and similar elements, that the next layer contains chiefly carbonates, and the germ, to a high degree, nitrates and phosphates. As bolting, however, gives us the carbonates, which supply fat to the human system principally, while it rejects the bran, useful as waste, and the nitrates and phosphates, which supply muscle and brain, doctors and other scientific men agree that unbolted meal ought to be taken as food, but people prefer the bolted, and there seems but little chance that the doctors will be obeyed.

At the mill in question, in handling and transporting the grain, meal and flour, mechanical means are used. There is an endless variety of bucket-elevators, screws and air channels, by means of which manual labor is rendered to a great degree unnecessary. For driving all the machinery there is a fine 200-horse power steam engine, made by Corliss, which has stood wonderfully well the wear and tear of manufacturing some 400,000 barrels of flour since it first started, about five years ago.

The Flour Market.

Besides the flour consumed in home use, large quantities are exported. The principal foreign markets are China and Japan, Mexico, Central and South America, the Pacific Islands, and even the East Indies. Large amounts are occasionally shipped to Australia, Great Britain and New York, but not at all regularly, these markets being open to us only when there is a failure in other crops. The high price of labor, the cost of coal, barrels, etc., and the comparatively low price of bran and mill feed in the State, are the drawbacks in competing with Eastern millers.

The production of the city mills is estimated at 405,568 barrels in 1867; 359,904 in 1868, and 375,231 in 1869. The total amount of flour sold here in these three years is given as 761,168, 693,180 and 696,539 barrels. The exports were 327,545 in 1866; 519,309 in 1867; 461,868 in 1868, and 427,497 in 1869. The average price per barrel for export flour was $5.80 in 1866 to '67, and $6.73 in 1867 to '68; in 1867 to '68 it fluctuated from $6 to $8 for choice family flour in the home market.

Drugs and Spices Ground.—It may not be generally known to druggists that they can have their drugs and spices properly ground in this city. The American Mills, Benn Bros. & M. Burke, proprietors, have recently been opened on California street, near Market, with the view of supplying a want of this kind. See their card.

Patents.—At White Pine and Austin the mine owners are reported to be very generally accepting the advantages of a good title to their mines, and are applying for patents.

A NEW VARIETY OF ASPARAGUS.—Mr. Conover, who cultivates a market garden near New York, and has a stall in Washington market, has recently prodnced a new and most extraordinary variety of asparagus, which has been named "Conover's Colossal." It has been but one year in market, and is said to be something quite extraordinary. Some accounts say the plant grows to twice the size of the common varieties. All agree in its being fully 50 per cent. larger than any heretofore prodnced, and that its flavor is equal to the best. It requires additional room for cnltivation, however, abont equal to its increased size, and mnst have plenty of mannre. Some of our California cultivators would do well to introduce it here.

* * *

THE CRICKET A THERMOMETER.—Mr. B. F. Cutter, of Pelham, gives some curious observations in regard to crickets. His theory is that the singing of the "merry cricket" is governed very largely by the temperatnre of the weather, and that the change of one degree, even, makes a corresponding change in its music. According to his experiments, when the temperatnre is at 74 degrees the cricket gives 154 "notes" in a minute; 72 degrees, 145; 70 degrees, 134; 67 degrees, 100; 48 degrees, 10.

NEW VOLUME.—The Scientific Press hss commenced a new volume. It has heen grestly improved in many ways. It is now a fins journal for the farming community as well as ths miner.—*Pajaronian.*

"Live and Let Live,"

Is a good old adage, and we shall adopt it as our own. We do not pretend to do work at "less than cost," as some people advertiss to do; but ws do claim to do sll kinds of printing as cheap as it can be dons on this Coast—and we helieve as cheap as it is DONE in Chicago. Customers, in the country or city, are invited to call in person at our offics, or send their orders by mail or express, and they will be fairly dsalt with.

SPAULDING & BARTO.
Scientific Press Offics,
414 Clay Street.

THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

HIBBERD, SANBORN & CO.,

STAIR BUILDERS.

South Point Mills, Berry Street, Between Third and Fourth, Ssn Francisco. Orders from he country promptly attended to. All kinds of Stsir Msterial furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins. Fancy Newels and Ba'usters.

SPECIAL NOTICE.

TO DEALERS AND CONSUMERS

—OF THE—

H & L

AXLE GREASE.

Having received your liberal patronage and support during the last fifteen years, and desiring to further extend its consumption, and if possib e meet the market of our Chicago friends, we have made a great reduction in pricos, and from our long experience we will satisfy you that there is none BETTER, and through your liberal patronage that there is none CHEAPER.

HUCKS & LAMBERT,
144 Natoma Street.

Depot, 320 Jackson Street.

N. B.—We are prepared to furnish Bulk Psckagos to contractors on equally liberal terms.

The Aerial Steam Navigation Company.

At a meeting of the stockholders of this company, December 17th, 1869, Messrs. Eugene Sullivan, Thomas N. Cszneau, Henry F. Williams and Simon L. Jones were appointed a committee to receive subscriptions for one thousand shares (one-tenth of the capital stock of the company) at the rate of ten dollars per share of the par value of one hundred dollars, said shares to be *unassessable.* The funds thus raised are to be devoted exclusively to the construction of the first aerial steam carriage, and to be deposited in ths Bank of British Columhia, to be dishursed upon requisition of Mr Georgs K. Glnyas, Engineer of Construction. Ths working drawings, etc., csn be seen at the office of Gen Thomas N. Cszneau, No. 321 California street, where subscriptions will he received. No invention for navigating the air has before received such positive indorsements from engineers of reputation, or so liberal encouragement from prominent capitalists as Marriott's Avitor, which now seems sure of being thoroughly tested on a largs scale. 2v20-my

RATES BY THE LINE.

Per line.—One week, 25 cents; one month, 80 cents; three months, $2; one year, $5.

Per line, ten lines or more.—One week, 20 cents; one month, 30 cents; three months, 80 cents; one year, $3.20.

Mining and Legal Advertisements will be inserted at special rates—less than one-half the cost of daily publication.

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form. We will otherwise assist advertisers in getting up their notices, when desired.

☞ All advertisements in the Press appear in both the ☞ the Monthly and Quarterly Series of the SCIEN- ☞ TIFIC PRESS, which (by special arrangement) are ☞ placed for free reading in the principal hotels, ☞ steamboat and steamship saloons, depots, and pub- ☞ lic reading rooms and libraries in San Francisco and ☞ Pacific States. Many volumes are also bound, thus ☞ affording permanent advertising.

The Press now receives the largest and best advertising patronage of any weekly paper west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—*our advertisers*. Better referees, or more reliable names, cannot be found in the advertising columns of any newspaper in the world.

STEAM
FIRE-PROOF
SAFES

SANBORN'S PATENT.

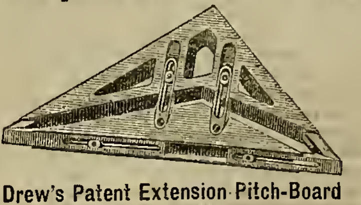
Perfectly Dry in Use.
ACTUALLY FIRE-PROOF.

GET THE BEST.

The remarkable fire-proof quality of these Safes has been fully demonstrated, having been subjected to severe practical tests with the Safes of all other prominent makers, and always with complete success, preserving its papers while the contents of its competitors were destroyed. A practical man needs but to examine them to be convinced of their superiority.

☞ Burglar-proof work, welded iron and steel, Sargent & Greenleaf's Magnetic and Automatic Locks. For sale by ROSS, DEMPSTER & CO.,
105, 107 and 109 California street,
6v20-3m San Francisco.

To Carpenters and Stair Builders.



Drew's Patent Extension Pitch-Board

Saves TIME, LABOR, and LUMBER, and secures exactness and perfect work. This is a very simple instrument, which is quickly and easily adjusted (as may be seen by the engraving), so as to give any desired pitch and tread for stair building. It is adjusted by a system of slides and screws. Full information may be obtained of the inventor, JOHN R. DREW,
5v20 Cor. Natoma and Fifth streets, S. F.

Metallurgy.

Metallurgical.

The undersigned respectfully announce to the public (especially to parties interested in mining) that they have opened an office at

No. 36 FREMONT STREET,

And WORKS at H. J. BOOTH & CO'S FOUNDRY, northeast corner First and Mission streets, San Francisco, where Ores in small or large quantities of all kinds can be worked by Pan Amalgamation, Chlorination or Smelting, and all kinds of Assays and Analyses made. We will also sample any Ores entrusted to our care; and in all cases returns made in the shortest time possible. We will give consultations on the best methods of successfully working Sulphurets or Refractory Ore.

Drawings Furnished for Quartz Mills, Smelting and Chlorination Furnaces.

By having had long practical experience in working Gold, Silver, Copper and Lead Ores, we hope thereby to get a share of the patronage of the mining public. ☞ Mines Examined and Reports made.

References.—William Bosworth, Thomas Varney, Egbert Judson, E. T. Steen, Wm. Bellshaw, P. Reichling, W. O. Sleeper, J. L. N. Shepard, Norbert Landry.

LEA & PERRINS'
CELEBRATED

Worcestershire Sauce.

CAUTION AGAINST FRAUD.

Declared by Connoisseurs to be the only good Sauce. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for Lea & Perrins' Sauce, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-1yeow

Important to Californians.

The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods cheaply, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

The plant has no enemies; mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $25 per hundred; 20 per cent. off to the trade. Address,
HENRY HUGHES & J. S. SILVER,
1v20-1m 302 Battery street, San Francisco.

International Hotel,
JACKSON STREET,
BETWEEN MONTGOMERY AND KEARNY STS.,
SAN FRANCISCO, CAL.

THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stop at. The Beds are new and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.

Prices varying from $1 50 to $2 per day for Board and Room.

FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.

☞ Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House free of charge, and to any part of the city for 50 cents
21v12 F. E. WEYGANT, Proprietor.

Reading for the Hour.

Behavior in Church.

Henry Ward Beecher has started a new paper called the *Christian Union*. Here is a specimen of his articles, which is well worth reading:

We may classify the petty civilities of church life thus:

1. *Smells.*—Violent perfumes, especially those containing musk, are disagreeable to most persons, and to some positively distressing. There is no smell so universally pleasing as *no smell*. Never scent yourself when going into a crowded assembly. The same is true of the residuary smell of tobacco which hangs about the garments and afflicts the breath of those who habitually smoke. But tobacco almost invariably makes men self-indulgent and regardless of others' convenience. More brutal yet are they who go to church reeking, like a Dutchman's soup, with the smell of onions. There are scores of people who have lost all profit of a Sunday service by the sickening smells which surround them.

2. *Sound.*—Whispering in church during the service is an affront to politeness. Much of the coughing which goes on in church arises from the poisonous gases and personal effluvia which exist in unventilated churches. But the power of the will over the muscles which do the coughing is very great. A heedless person will cough twice as much as is needful—will cough at the worst time possible, will cough plump upon the necks of those before him, instead of embalming the sound in his handkerchief as, with a little skill and politeness, he might easily do. In all cases when it is a man's duty to sleep in church, it is his duty also to snore with the soft pedal down.

3. *Sight.*—Every one likes to see the minister. It cannot be done through your body. True, you cannot help being before somebody unless you are on the back seat. But, with a little thought, you may very much help those behind you. Any conduct which shall divert the attention of others from service, such as ostentatious playing with a watch, or opening and shutting it, reading books or papers, looking about inquisitively, is impolite.

Many churches have the Ten Commandments set up on the wall, in sight of the whole congregation; although not one of the sins reprobated therein is likely to be committed in church time. Would it not be well to have another tablet enumerating the sins which men are prone to commit in church time?

No postage is charged at the post-office at the southern extremity of America. A small barrel,—so they say,—has been fastened by an iron chain to the outermost rock of the mountains overhanging the Straits of Magellan, opposite Terra del Fuego. It is opened by every ship that passes through the straits, either to place letters in it or to take letters from it. This post-office, therefore, takes care of itself. It is confided to the protection of seafarers, and there is no example of any breach of this trust having occurred. Each ship undertakes the voluntary transmission of the contents of the barrel, if their destination is within the limits of its voyage.

Tahoe or Bigler?—Several suggestions have been made with regard to naming this lake, during the discussion in the State Legislature. One legislator proposed an amendment to the effect that the ends of justice would be subserved by changing the name of Lake Tahoe to John Bigler, and the name of John Bigler to John Tahoe, by which title and designation the gentleman should be known in all public documents hereafter. The Grass Valley *Union* suggests as a compromise, one of the four names, Biglertahoe, Tahoebigler, Tabiglerhoe, or Bigtaholer.

The Hon. Mrs. Theresa Yelverton, an English lady who has acquired much renown by the ability with which she successfully pleaded her own cause in a matrimonial suit in England, gave a reading entertainment to a select, but not large audience in the hall of the Mercantile Library on Thursday evening of last week.

Exhibition of Flying Machines in England in 1867.

It was a marvelously strange scene which met the visitor, as he entered the large halls rented by the Aerostatic Society, and great was his surprise as he beheld the result of all that the practical good sense of the English, their mechanical ingenuity and their scientific experience had been able to produce. The exhibitors seemed to have forgotten the very first principles of aerial dynamics; their efforts were almost altogether limited to an imitation of the flight of birds, quite unmindful of the fact, that even the first and most important balloon already surpassed the bird as much as reality surpasses dreams. There were all kinds of possible and impossible contrivances to be seen, from the manikin furnished with real swan's wings, fastened to immense frames, to the vessels shaped after the models of ships, which were to be filled with hydrogen, and to be steered through the air by the aid of a huge rudder. There was but a single balloon there which could be tested practically; a so-called Montgolfiére, which was to ascend, held by stout ropes to the ground. It was to be filled on the first day of the exhibition; but a gentle breeze, which would not have affected in the slightest degree a well-built balloon, caused it in an instant to sway so violently to and fro, that the silk folds fell upon the furnace over which it was held, when a slight blaze flashed up, and the Montgolfiére had ceased to exist. * * *

There was a cigar-ship, a tunnel-shaped balloon, within which a few hundred captive passengers were to turn a gigantic wheel, after the fashion of a squirrel's cage, to propel the monster through the air. Near by was a famous machine, covered with goldbeaters' skin, and working admirably as long as it was suspended by two good-sized ropes from the walls of the building. A curious noise was heard, and a flying-car started in the air, by the aid of a tiny steam engine heated with petroleum, and moving two screws at the rate of 600 turns in a minute. Then there was a superb collection of wings, some as small as a pigeon's, and others as large as a windmill's sails; with a tail and without one; moved by the muscles of the human body, or by powerful steam engines; only no wings among them all could raise the owner a foot from the ground without the aid of a rope, on which he was suspended. They were generally nothing more than copies of former experiments: of the noble "Butterfly," who, after the French revolution, threw himself boldly from a window of his house on the river, and astonished the washerwomen below by falling into their soapsuds; or of a poor musician, who, a hundred years before, attempted to fly down from one of the high terraces at St. Germain, and escaped with a broken leg.

Finally, there were machines without end which were to move in the air by their lightness. Here a round copper kettle, weighing only a few pounds, and made to be sent flying by continuous explosions of gun-cotton; there a huge air-tight basket, with a petroleum lamp, which was to be kept burning inside, but was happily never lighted; on one side an aluminum motor, by a Frenchman, in real motion, though cautiously remaining on the same spot; and on the other an apparatus (built, under instructions from the Duke of Argyle, for the study of the flight of birds) which hopped ungracefully from place to place. Nor were, on the other hand, and as if to contrast agreeably with these strictly scientific and very complicated contrivances, the simplest methods left unrepresented; kites were exhibited of all sizes and colors, from the triangular toy of the street boy, to the gigantic monster of the Japanese. But no one had been bold enough to offer to raise himself by the aid of one of the colossal kites which would have easily lifted a man up to the clouds.

By the side of the kite stood rockets. The power of this weapon (for only as such, unfortunately, does it appear as yet) to lift up a considerable weight is perfectly well known and easily ascertained by simple calculations. As long ago as 1830, an Italian *savant* fastened a sheep to the stick of a rocket, raised it to a great height, and saw it return, uninjured, to the ground. In times of war, it is also well known, lights are thrown up, by the same means, which burn steady for several minutes in the air, sustained by miniature parachutes, and thus enable one party to watch and examine the works of the other. A French author offered, in 1869, in the *Scientific Review*, to submit to the experiment of being fired off by means of a gigantic rocket, relying upon the well-established fact that the movements of this projectile are much gentler and less dangerous than those of a balloon suddenly rising to a great height. The offer seems, however, to have been utterly disregarded; or perhaps it was looked upon as an attempt to ridicule the unsuccessful efforts of aeronauts generally. The neglect of this mode of transportation in the air is to be regretted, as there is evidently a wide field open yet to the inventor.

No improvement was exhibited at the Crystal Palace, and no success seems to have been achieved in any direction. In vain had the company offered a handsome premium for the machine which should accomplish even the modest triumph of remaining but five minutes at the height of ten feet in the air. In vain had the Duke of Sutherland offered another premium for the apparatus—not a balloon—which should lift a man a hundred feet high. In vain had the Aeronautic Society even promised a considerable sum to the inventor of the lightest machine relatively to its power. All the liberality, all the zeal, had called forth no genius; and not a single premium, we believe, was awarded.—*W. de Tonvielle.*

Mono Lake.—With regard to this lake the following statements are made: The lake is eighteen miles in length, by thirteen in width. Its color in the center is a dark bottle-green; near the shore of an alkali color. On the western shore numerous streams enter into it. On the northern and northeastern shore innumerable springs boil up from the bottom. One of these springs is twenty-five feet in diameter, and comes to the surface with such force that it is impossible to keep a boat on the top of it. It is one-half mile from the shore, and in twenty-eight feet of water. On the shore of the lake, numerous columns of rock, resembling coral, rise from the water. They are from five to fifty feet in height, and supposed to have been formed by the fresh water springs, which, in almost every instance, burst from beneath them. They are of different diameters, and have been worn by the wind, and woven into the most fantastic shapes, then encrusted by the calcareous deposit of the water, which gives them the appearance of marble columns, or the ruins of some magnificent temple. Two or three miles back from the shores the same rock exists, proving that the lake has been at least one thousand feet higher than at present.

A Dog's Bed.—The best bed which can be made for a dog, consists of dry newly-made deal shavings; a sackful of these may be had for the asking at almost any carpenter's shop. The dog is delighted in tumbling about in them until he has made a bed to suit himself. Clean wood shavings will clean a dog as well as water, and fleas will never infest dogs that sleep upon fresh deal shavings. The turpentine and resin in new pine soon drive them away.

The following is given as the reason why a dog turns round and round, repeatedly, in lying down: The dog, in its wild state, prefers to make his bed in the grass. To form a bed in such a place, he makes the evolutions described in order to beat down and render the grass smooth. This original instinct has never left him.

California the Banner State.—California, with all her other claims of a singular superiority, is now in condition to claim the honor of being the Banner State of the Union. She is the first to manufacture silk in the Republic, having begun literally *ab ovo*, from the eggs, produced the cocoons and carried the usual processes to the completion of a beautiful texture, such as may stand a comparison with the silk of the Old Continent. Part of the California silk has been shaped into flags, one of which is to wave from the Capitol at Washington, and another from the dome of the State Capitol, to signalize one of those peaceful victories which are generally of more importance to a people than the victories of war.—*New York Times.*

Density of Population in Europe.—A German has given some statistics on this point, among which he has the following interesting computation: In France there is one dwelling-house to every 4.9 inhabitants; in England and Wales, 5.1; in Belgium, 5.2; in Ireland, 5.6; in Holland, 5.9; Italy, 5.9; Spain, 5,9; Bavaria, 6.2; Norway, 6.4; Austria, 6.6; Baden, 6.8; Hanover, 6.9; Switzerland, 7.2; Prussia, 8.9, and Saxony, 9.7. In cities one dwelling comes upon 6.2 inhabitants in Belgium; 8.4 in Hanover; 8.8 in Switzerland; 10.2 in Bavaria; 11.5 in Norway; 12.7 in Prussia; 13.1 in France; 14.2 in Saxony.

The Coming Young Lady.

She will vote, will be of some use in the world, will cook her own food, will earn her own living, and will not die an old maid. The coming girl will not wear the Grecian bend, dance the German, ignore all possibilities of knowing how to work; will not endeavor to break the heart of unsophisticated young men, will spell correctly, understand English before she affects French, will preside with equal grace at the piano or wash-tub, will spin more yarn for the house than for the street, will not despise her plainly-clad mother, her poor relations, or the hand of an honest worker; will wear a bonnet; speak good, plain, unlisping English; will darn her own stockings; will know how to make doughnuts, and will not read the New York *Ledger* oftener than she does her Bible.

The coming girl will walk five miles a day, if need be, to keep her cheeks in a glow; will mind her health, her physical development and her mother; will adopt a costume both sensible and conducive to comfort and health; will not confound hypocrisy with politeness; will not place trying to please above frankness; will not have courage to cut an unwelcome acquaintance; will not think refinement is French duplicity; that the assumed hospitality where hate dwells in the heart, is better than condemnation; will not confound grace of government with silly affection; will not regard the end of her being to have a beau.

The coming girl will not look to Paris, but to reason, for her fashions; will not aim to follow a foolish fashion because milliners and dress-makers decreed it; will not torture her body, shrivel her soul with puerilities, or ruin it with wine and pleasure. In short, the coming girl will seek to glorify her Maker, and to enjoy mentally His works. Duty will be her aim, and life, a living reality.—*New York Excelsior Magazine.*

Adulterations in Candy.—The New York *Herald* is doing good work in showing up the adulterations in candy manufacture. It finds that the largest ingredient into the adulterous process is *terra alba*, a species of chalky earth imported from Kentucky, thousands of hogsheads of which are used in New York every year. Its cost is a cent and a quarter a pound, and it is used in the place of sugar at fifteen cents a pound. It has a sweet taste, and in this regard is a very good substitute for sugar, but its effects upon the system is deleterious. Other substances are used, such as starch, glue, glucose and fecule. Verdigris is used for coloring green, and red is produced by the sublimate of mercury. In place of licorice lampblack is employed, and the Tonka bean—almost as bad as opium—is substituted for vanilla. To produce flavors of pineapple, raspberry, banana and other fruits, chemically prepared extracts are used, into which not a particle of the juice of these fruits enter, and which are so many poisons introduced into the human stomach.

Drunkenness in the Old Time.—A law to prevent drunkenness by prohibiting the public promiscuous sale of intoxicating drinks was by no means original in the State of Maine. The vice is as old as our race. Our ultimate ancestors, the Vikings, drank fire-water upon earth, and quaffed mead in Paradise; our more recent progenitors in Great Britain drank gin and grovelled. A gin shop in Southwark, London, one hundred and thirty years ago, had this alluring sign: "Drunk for a penny; dead drunk for tuppence; clean straw for nothing." What more could man, the image of his Maker, ask? People often died of drunkenness in the taverns; and there was a temperance party, even then, that demanded a prohibitory law, and they succeeded in carrying a bill through Parliament which laid upon liquor a tax so heavy that it became too costly for the poor, and which prohibited the sale of drams. Sir Robert Walpole, whose boozing orgies at Haughton are not unknown, finally acquiesced in the law.—*Harper's Magazine*

A Beautiful Idea.—There is a tree in Sumatra that puts forth its leaves and flowers, fraught with the richest fragrance, only in the night. Day sees it robbed of its breath and stripped of its blossoms and its green. So the darkness of adverse fate draws the brightest and sweetest virtues from the same soul that in the sunshine of prosperity shows but a scentless barrenness of good.—*Alfred B. Street.*

A countryman in Portland, after eating three dozen raw oysters, told the man to stop when he had opened ten cents' worth.

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the SCIENTIFIC PRESS and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the SCIENTIFIC PRESS office, postpaid, for $1.—*New Age.*

TREATMENT OF REBELLIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

SPECTACLES, their adaptation to the various conditions of sight, is C. Muller's specialty. His store is at 205 Montgomery street. *

VIRGINIA, NEV., Jan. 27, 1870.

MESSRS. DEWEY & Co., *Patent Agents*—Dear Sirs:—I have your favor of the 24th inst., informing me that my application for patent of "Improved Roofing and Flooring" has been allowed, and I thank you for the attention and dispatch used in executing this business for me. Yours truly, PATRICK N. MACKAY.

New Mining Notices.

Glenwood Mill and Mining Company.—

Location of Works: Greenwood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of February, 1870, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on the seventh day of March, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of March, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D SQUIRE, Secretary.
Office, 418 California street, San Francisco. feb52

North San Francisco Homestead and

Railroad Association:—Location of Property: City and County of San Francisco, State of California.

Notice is hereby given, that at a meeting of the Trustees of said Association, held on the ninth day of February, 1870, an assessment of seven dollars and fifty cents was levied upon the capital stock of said Association, payable immediately, in United States gold coin, to the Secretary, at his office, No. 415 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the ninth day of March, 1870, shall be declared forfeited, and duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirtieth day of March, 1870, to pay the delinquent assessment thereon, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.
Office, 415 Montgomery street, San Francisco. feb12

Nevada Land and Mining Company.—Location of Works:

Steptoe, Johnson & Latham, Antelope and Clifton Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of February, 1870, an assessment of two and one-half cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Tuesday, the fifteenth day of March, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the fifth day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.
Office, Room 5 No. 302 Montgomery street, San Francisco, California. feb12

Taylor Mill and Mining Company.—Location of Works:

Georgetown District, El Dorado Co., State of California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the fifth day of January, 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of January, 1870, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 226 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of February, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twelfth day of March, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

ENOS TAYLOR, Secretary.
Office, 226 Clay street, San Francisco. ja29

Oil Cake Meal.

THE BEST FEED KNOWN

For Live Stock.

We desire to call attention to OIL CAKE MEAL, which we are now manufacturing. No description of feed so greatly promotes the health of animals as Oil Cake Meal, and we urgently request all engaged in the dairy business, raising and fattening stock, or wool-growing, to give it a trial, feeling confident that they will find it of very great value. By those who have used it thoroughly, ONE pound is pronounced to be equal to two pounds of Corn Meal; and in the U. S. Government Report of the Department of Agriculture for 1865 it stands in the following relation to other feeds as to the percentage of flesh produced from a hundred pounds of feed, viz: Indian Corn Meal, 11 pr ct.; Barley Meal, 13 pr ct.; Oat Meal, 18 pr ct.; Oil Cake Meal, 22 2-100 pr ct. For life-sustaining properties for all stock exposed to sudden changes of weather, or over-driving it has no equal.

FOR MILCH COWS it is particularly valuable, increasing the quantity of milk and improving its quality to a far greater extent than any other feed known. A suitable quantity for them at the commencement is one quart in the morning and one quart at night, either alone or mixed with any other food; generally mixed with the mash of bran, slops, roots, or cut feed of any kind. It will improve it to soak it for six or eight hours, the effect being to increase its bulk two or three times. The quantity can be increased gradually, according to the effect produced—ordinarily not exceeding three or four quarts per day.

FOR BEEF CATTLE it has fattening properties which cannot be found in any other feed—the beef always being more tender and juicy and of much finer quality than when fattened on any other feed; and no feed known will so quickly prepare animals for market as Oil Cake Meal.

FOR HORSES, a small quantity given daily promotes their health, and is especially valuable for them when chilled or injured from over-driving. It is one of the best remedies known for Horses subject to the Heaves or Rheumatism, and greatly increases the cleanliness, evenness and glossiness of the hair.

FOR SHEEP, there is no article of feed known that produces such fine mutton, or so promotes the growth of wool. A small quantity given to chilled Cattle or Sheep will keep them alive and greatly increase their warmth and vitality.

At present price ($28 per ton) it is the cheapest feed in market. It is now selling in New York at $42 per ton, gold; at $50 per ton in England, where it has been proven for a long time to be in every respect the most profitable feed known for stock of all kinds—one ton being fully equal to three tons of bran.

The increasing demand for this Meal from those on this coast by whom it has been thoroughly tested has induced us to increase our facilities for its manufacture, and we are now fully prepared to furnish it in quantities as may be desired. For sale by the Grain and Feed Dealers, and at the Manufactory, King street, near Third. All orders will receive prompt attention. Address—

DR. ABORN,

Oculist, Aurist,

AND

CATARRH, THROAT

AND

Lung Physician.

No. 22 KEARNY STREET,

SAN FRANCISCO, CAL.

Testimonials from Well-known Citizens of California as evidence of his success.

Card from Charles N. Fox Esq., of the firm of Campbell, Fox & Campbell, Attorneys, 528 California Street.

I have for many months suffered from Catarrh, accompanied with unpleasant sensations and sounds in the ears. Recently I found my hearing impaired, and at once applied to Dr. Aborn, No. 22 Kearny street, San Francisco. He improved my hearing almost instantaneously, and now, after being under his care six days only, I feel as if entirely cured, and my hearing is restored. CHARLES N. FOX,
San Francisco (Cal.), Jan, 10, 1870.

Card from S. O. Houghton, Esq., Attorney at Law.

I have been afflicted with severe nasal Catarrh for two years, which a few months since extended to my throat, producing a distressing cough, and seriously impairing my health generally. I have been under treatment by Dr. Aborn, at 22 Kearny street. San Francisco, for about three weeks, and have been already greatly relieved—my cough has almost disappeared and my health greatly improved. By one application, Dr. Aborn relieved me of a very severe neuralgic pain, and with four applications it was entirely cured. S. O. HOUGHTON.
San Jose (Cal,), Nov. 22, 1869.

From Hon. Jas. A. Johnson, M. C., California.

TO WHOM IT MAY CONCERN.—Having been a sufferer with Catarrh and a severe bronchial affection for more than seven years, and having found great relief by submitting myself to Dr. Aborn's treatment for a few days only, I take pleasure in saying Dr. Aborn, with his new and improved instruments for local applications to the lungs, air passages, eyes and ears, should encourage all who are affected in those parts to cherish a lively hope that they may find quick and permanent relief. · Very truly, JAMES A. JOHNSON, M. C., California.

A Wonderful Cure.

Having been afflicted for over twenty years with a disease in the left nostril, which has been called by different names—cancer, scrofula and ozena—different physicians have tried their skill in attempting its cure, but without success. It has rendered me incapable of labor for the last two years. Since the beginning of June last I have been in the Sacramento hospital reduced to a mere skeleton. On the 23d of November I left the hospital, and since the 26th have been under the treatment of Dr. Aborn in this city, and the disease is already nearly cured, and my strength and general health very much improved, and I have full confidence of a perfect cure. Already I have gained many pounds in weight, and look and feel like another person. The success of Dr. Aborn's treatment in my case should be sufficient to encourage all who have chronic diseases to make another trial for that good prize—health.

WILLIAM BEARDSLEE.
Pacific House, San Francisco, Dec. 13, 1869.

Another Remarkable Cure.

For the benefit of the afflicted and as an act of justice to the skill of Dr. Aborn, I make the following statement: For about two years I was seriously afflicted with a bronchial affection. I had a distressing cough, difficulty of breathing, expectoration, night sweats, and was losing flesh very rapidly. I was treated by five physicians without any benefit, but continued to grow worse, and was finally advised by them to leave the city, as in their opinions I could not be cured in this climate; but my business relations were such as to preclude a change of climate, although my health was declining so fast that I could not have lived long without relief. Two months ago, when Dr. Aborn arrived, I read his publications and the testimonials of his remarkable cures, which led me to believe that there must be merit in his treatment. So I placed myself under his care, and it is with great pleasure that I am able to say that he has cured me of those distressing and dangerous bronchial affections; also, the night sweats, cough, etc. I was unable to attend to business since April last, until after being under Dr. Aborn's treatment for one week. My improvement was so rapid that in one week's time I was able to resume my business, and I have continued to gain ever since so rapidly that even my friends are surprised at the remarkable results of his treatment.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Merevilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and claborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths end cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Meravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers end manufacturers heve attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend e more agreeable or valuable beverege."

Sold in packets only by all Grocers, of whom also may be had Teylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

Vice-President..............................MICHAEL REESE.
Treasurer..............................J. SELIGMAN & CO.
Secretary and General Agent.........W. K. VAN ALEN.

Board of Trustees—Samuel Merritt, Michael Reese, Abraham Seligman, John B. Felton, Joseph Aron, Wm, H. Sharp, Henry Barroilhet.

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, SEVEN MILES IN LENGTH BY FOUR THOUSAND FEET IN WIDTH, EMBRACING FIVE THOUSAND AND TWENTY ACRES.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of ALL mines discovered by the Tunnel.

4th—A royalty forever of TWO DOLLARS on each and every ton of ore extracted from any part of the Comstock Lode, and

5th—The right of appropriation of all the water carried off through the Tunnel.

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, end be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to ell parts of the mines, end through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make availeble many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt es to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, es has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwell, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata end Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots end mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very importent revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Compeny two dollars per ton, forever, on every ton of ore extracted from eny portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of his great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, end confidence in, all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coest,

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

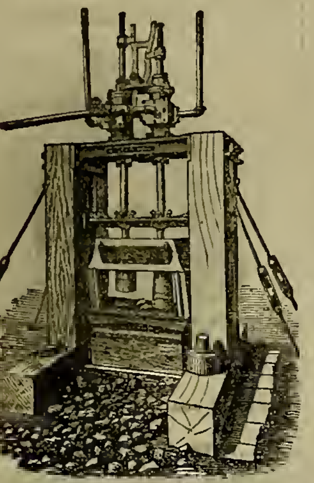
Machinery.

THE WILSON

Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

CROSS' COMBINED

Heater & Sediment Collector

This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

16v18-3m Patentee, Sacramento, Cal.

RICE'S PATENT

SELF-ADJUSTING

UNIFORM STAMP LIFT.

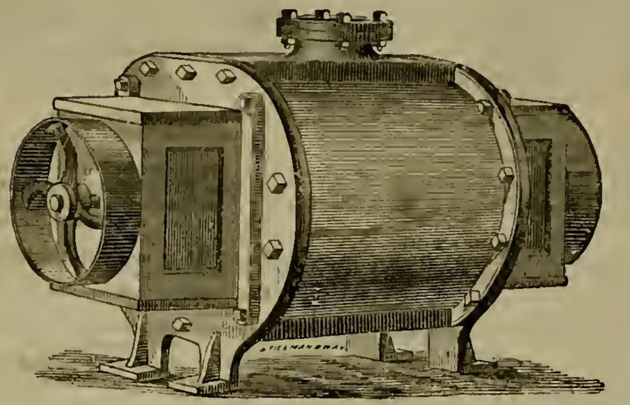
A Model of this valuable invention can be seen at the MINERS' FOUNDRY CO-OPERATIVE, 235 to 245 First street, San Francisco. 4v20-1m

ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

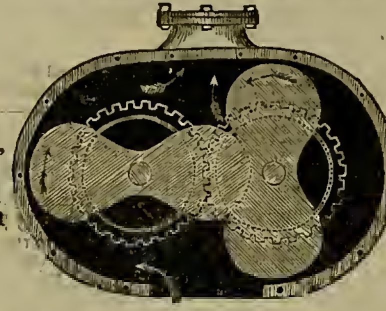
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

Pacific Iron Works, San Francisco.
Refer to John Sime and J. J. Haley. 19v19

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

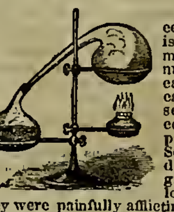
Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street,

1v1 San Francisco.

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.



The reputation this excellent medicine enjoys, is derived from its cures, many of which are truly marvellous. Inveterate cases of Scrofulous disease, where the system seemed saturated with corruption, have been purified and cured by it. Scrofulous affections and disorders, which were aggravated by the scrofulous contamination until they were painfully afflicting, have been radically cured in such great numbers in almost every section of the country, that the public scarcely need to be informed of its virtues or uses.

Scrofulous poison is one of the most destructive enemies of our race. Often, this unseen and unfelt tenant of the organism undermines the constitution, and invites the attack of enfeebling or fatal diseases, without exciting a suspicion of its presence. Again, it seems to breed infection throughout the body, and then, on some favorable occasion, rapidly develop into one or other of its hideous forms, either on the surface or among the vitals. In the latter, tubercles may be suddenly deposited in the lungs or heart, or tumors formed in the liver, or it shows its presence by eruptions on the skin, or foul ulcerations on some part of the body. Hence the occasional use of a bottle of this *Sarsaparilla* is advisable, even when no active symptoms of disease appear. Persons afflicted with the following complaints generally find immediate relief, and, at length, cure, by the use of this *SARSAPARILLA: St. Anthony's Fire, Rose or Erysipelas, Tetter, Salt Rheum, Scald Head, Ringworm, Sore Eyes, Sore Ears*, and other eruptions or visible forms of *Scrofulous* disease. Also in the more concealed forms, as *Dyspepsia, Dropsy, Heart Disease, Fits, Epilepsy, Neuralgia,* and the various *Ulcerous* affections of the muscular and nervous systems.

Syphilis or *Venereal* and *Mercurial Diseases* are cured by it, though a long time is required for subduing these obstinate maladies by any medicine. But long continued use of this medicine will cure the complaint. *Leucorrhœa* or *Whites, Uterine Ulcerations,* and *Female Diseases,* are commonly soon relieved and ultimately cured by its purifying and invigorating effect. Minute Directions for each case are found in our Almanac, supplied gratis. *Rheumatism* and *Gout,* when caused by accumulations of extraneous matters in the blood, yield quickly to it, as also *Liver Complaints, Torpidity, Congestion* or *Inflammation* of the *Liver,* and *Jaundice,* when arising, as they often do, from the rankling poisons in the blood. This *SARSAPARILLA* is a great restorer for the strength and vigor of the system. Those who are *Languid* and *Listless, Despondent, Sleepless,* and troubled with *Nervous Apprehensions* or *Fears,* or any of the affections symptomatic of *Weakness,* will find immediate relief and convincing evidence of its restorative power upon trial.

The Artesian Well at Oakland Point.

The artesian well undertaken by the Railroad Company at Oakland Point has been brought to a stand, at the depth of 300 feet, by striking what has been termed bed-rock. Although they did not suceeed in getting flowing water, they found, at the depth of 285 feet, a bed of clayey gravel, four feet thick, which supplies excellent soft, fresh water, *that rises to the surface.* The company have tapped the pipe at this point, and will pump the water into tanks with steam power.

In sinking down, the auger brought up gravel every fifteen feet, the intervening beds being clay. The first surface water was fresh, but brackish, getting salter in every spring till the depth of 165 feet was reached, when it was as salt as the sea. At 180 feet the first fresh-water spring was struck, and each succeeding gravel deposit also yielded fresh water. At a depth of 268 feet below the level of the sea, a strata of what has been called drift-wood, was struck, about seven feet thick, which was decomposed, and came up pulverized with mud.

The above information was obtained by our correspondent from Mr. Higgins, the superintendent of the well-boring, who has also forwarded several specimens, which we have carefully examined, especially those taken from the so-called "bed-rock," and the "drift-wood," brought up by the auger. The former appears to be a very hard, indurated clay, but not such as may properly be termed "bed-rock." Other deposits of gravel may, no doubt, be found below it. The substance called "drift-wood" is simply a soft clay, containing, by careful examination, only twelve per cent. of organic matter.

◆

A Word for Home Inventors.

Oakland, Cal., December 1, 1869.

Messrs. Dewey & Co.—Gentlemen: Permit us through your paper to return our earnest thanks for the prompt and successful manner in which you have conducted the various matters of business with the Patent Office committed to your care, more especially in securing for us our last valuable patent in the face of so many difficulties. Were it an ordinary case, in which you had simply secured us a patent, and for which services you had received a suitable equivalent, we should hardly consider you entitled to our thanks, however much we might feel gratified with your professional ability, uniform courtesy, or success. But this seems to be an exceptional case, and entitled to peculiar consideration. Without entering here into a detailed account of the legal complications and various discouraging circumstances you were obliged to contend with, suffice it to say, that your almost unhoped for success, securing, as you did, a full patent, despite all these obstacles, in so short a time, was scarcely less surprising than gratifying to us; and we feel it a pleasant duty to offer you this merited testimonial of our appreciation for the valuable services rendered, and to return you our sincere thanks for the same.

In closing, we would say to the public that this is entirely voluntary on our part, as Messrs. Dewey & Co. neither asked it at our hands, nor knew that we intended giving it. It is simply a free-will offering to professional skill and reliability, and a word of friendly counsel to others on this coast who may be possessed of valuable inventions on which they wish to secure patents. To all such our earnest advice is to place them at once in the hands of Dewey & Co., instead of being driven to it by a sad experience like our own.

Yours truly,
Hubert Burgess,
James Stratton.

◆

Scientific Press.—The title of the Mining and Scientific Press, published by Dewey & Co., has been changed to the Scientific Press. This is one of the most valuable of our exchanges, and we are pleased to notice the great improvements made in it the past year. On the 1st of January it began a new volume, entering upon its tenth year.—*San Bernardino Guardian.*

Crucibles.

The Patent Plumbago Crucible Co.
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT, Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 116 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S. Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
18v18-9p 519 Front street, San Francisco

The Scientific Press,

Devoted to Scientific and Mechanical Progress, Mining, Farming and Mechanic Arts, contains more valuable Reading Matter than any other weekly journal west of the Rocky Mountains. It is the best printed and only finely-illustrated paper on the Coast. Its articles are able, timely and reliable, and written in a more interesting and easily comprehensive style than scientific papers in general. Now in its twentieth volume, it is printed on superior paper, containing sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe. All our best citizens are interested in the new discoveries in the development and progress of the three great industrial pursuits named above, which are closely allied on this coast, and are jointly represented in the Press, rendering it a popular and influential journal with all industrial readers. Subscriptions reduced to $4 a year, Jan. 1, 1870.

To Inventors on the Pacific Coast.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Scientific Press. We transact every branch of Patent business, and obtain Patents in *all civilized countries.* The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Advice and Circulars free. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Engraving on Wood, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

DEWEY & CO.

PACIFIC
Rolling Mill Company,
SAN FRANCISCO, CAL.
Established for the Manufacture of
RAILROAD AND OTHER IRON
—AND—
Every Variety of Shafting,
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames
—ALSO—
HAMMERED IRON
Of every description and size.
☞ Orders addressed to PACIFIC ROLLING MILL COMPANY Post Office, San Francisco, Cal., will receive prompt attention.
☞ The highest price paid for Scrap Iron 9v143m9p

ENGRAVING ON WOOD DESIGNING AND ENGRAVING on wood and for electrotype cuts of every description, done by superior artists at the office of the SCIENTIFIC PRESS. Fine Cuts made for Book and Newspaper Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc., etc. Prompt execution and reasonable prices.
DEWEY & CO.,
No. 414 Clay street, S. F.

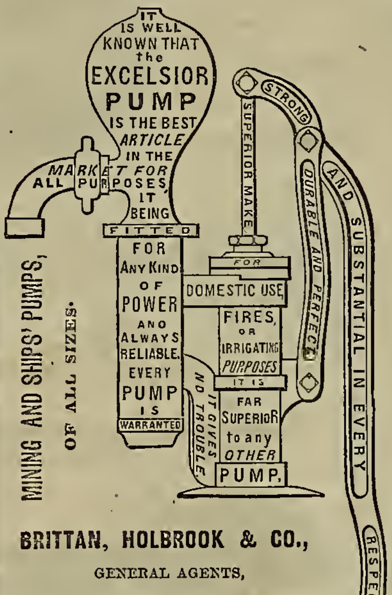
MANUFACTURING
Room to Let.

We have a large room, about 18 by 36 feet, in second story at 414 Clay street, near Sansome, which we will rent very low, suitable for printing or manufacturing purposes
DEWEY & CO.,
Publishers Scientific Press, 414 Clay street.

DEWEY & Co.
American and Foreign
Patent Agents.
Scientific Press Office, 414 Clay Street,
SAN FRANCISCO.

Patents Obtained Promptly.
Caveats Filed Expeditiously.
Patent Reissues Taken Out.
Patents Secured in Foreign Lands.
Assignments Made and Recorded in Legal Form.
Copies of Patents and Assignments Procured.
Examinations of Patents made here and at Washington.
Examinations made of Assignments Recorded in Washington.
Examinations Ordered and Reported by Telegraph.
Rejected Cases taken up and Patents Obtained.
Interferences Prosecuted.
Opinions Rendered regarding the Validity of Patents and Assignments.
Every Legitimate Branch of Patent Agency Business promptly and thoroughly conducted.
Illustrated Circulars Free.

DEWEY & CO.,
Publishers and Patent Agents, No. 414 Clay street below Sansome, Saa Fraacisco.



MINING AND SHIPS' PUMPS,
OF ALL SIZES.
IT IS WELL KNOWN THAT the EXCELSIOR PUMP IS THE BEST ARTICLE IN THE MARKET FOR ALL PURPOSES, IT BEING FITTED FOR ANY KIND OF POWER AND ALWAYS RELIABLE. EVERY PUMP IS WARRANTED
FOR DOMESTIC USE, FIRES, OR IRRIGATING PURPOSES IT IS FAR SUPERIOR to any OTHER PUMP.
IT GIVES NO TROUBLE.
SUPERIOR MAKE
STRONG
DURABLE AND PERFECT
AND SUBSTANTIAL IN EVERY RESPECT.

BRITTAN, HOLBROOK & CO.,
GENERAL AGENTS,
111 and 113 California Street,
SAN FRANCISCO.

For Miners, Millmen and Metallurgists.

KUSTEL'S NEW WORK,
CONCENTRATION
Of all kinds of Ores, and the
CHLORINATION PROCESS,
For Gold-Bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally.

Price, - - - - $7.50

A liberal discount to the Trade. For sale by the Booksellers. Sent to any part of the United States, postage paid, on receipt of the price. Address,

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.
M. PRAG,
8v18 ly Stove Store, No. 1 Clay Street, below Davis.

W. T. GARRATT,
CITY
Brass and Bell Founder,
Corner Mission and Fremont Streets,
MANUFACTURER OF
Brass, Zinc and Anti-Friction or Babbet Metal
CASTINGS,
Church and Steamboat Bells,
TAVERN AND HAND BELLS, GONGS,
FIRE ENGINES, FORCE AND LIFT PUMPS.
Steam, Liquor, Soda, Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder and Copper Rivets, etc. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles. HYDRAULIC PIPES AND NOZZLES for mining purposes. Iron Steam Pipe furnished with Fittings, etc. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."
☞ Highest Market Price paid for OLD BELLS, COPPER and BRASS. 8-tf

HUNTINGTON, HOPKINS & CO.,
—IMPORTERS OF—
HARDWARE,
BAR AND SHEET IRON,
Steel, Coal, Smiths' and Miners' Tools,
Boiler Tubes, Gas Pipe and Fittings, Belting, Hose, and
RAILWAY SUPPLIES.

N. W. SPAULDING,
Saw Smithing and Repairing
ESTABLISHMENT.

Nos. 17 and 19 Fremont St., near Market,
MANUFACTURER OF
SPAULDING'S
Patent Tooth Circular Saws.
They have proved to be the most durable and economical Saws in the World.
Each Saw is Warranted in every respect.
Particular attention paid to construction of
Portable & Stationary Saw Mills.
MILLS FURNISHED AT SHORT NOTICE,
At the lowest Market Prices.

STEEN & CUSHING,
AGENTS FOR THE
PURCHASE AND SALE
—OF—
Patent Rights, Engines, Boilers,
—AND
MACHINERY OF ALL KINDS.
NO. 9 FIRST STREET, SAN FRANCISCO.
WE HAVE ON HAND IN GREAT VARIETY,

Engines and Boilers,	Malt Rolls,
Steam and Hand Pumps,	Injectors,
Pipe,	Lathes and Planers,
Presses,	Governors,
Shafting,	Steam Gauges,
Pulleys,	Quicksilver,
Boxes,	Gas Stocks and Dies,
Mill Stones,	Belting,
Portable Mills,	Water-tanks, etc.,

Which we will sell at a discount of 25 to 75 per cent. on cost of new, in this city. Parties having any kind of machinery for sale, may meet with customers by consigning to us. Purchases made on Commission, and prices guaranteed as low or lower than parties can make themselves.
STEEN & CUSHING,
No. 9 First street, San Francisco.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology. and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v8-ly16p

The Johnston Distilling Process.

The San Francisco daily *Examiner* and Placer *Herald* have mistaken the processes employed by Mr. Johnston, of this city, and Mr. Downey, of Los Angeles, for procuring pure brandy, in supposing them to be identical. Mr. Downey, in reference to the matter, has published a card, in which he says:

> I have the pleasure of an acquaintance with Mr. Johnston, and am knowing to the fact that he is engaged in the invention and introducing to use of a still, which, in my judgment, may revolutionize the present system of brandy distillation. There is no conflict or antagonism between Mr. Johnston and myself, nor does the process by which I have succeeded in producing, after years of study and labor, a superior quality of brandy, interfere with the invention and use by Mr. Johnston of a new and superior still, which, if upon examination it proves to be what it promises, I shall be desirous to obtain and use. My business is distilling and rectifying, and as soon as Mr. Johnston puts his newly-invented still on the market, if it is an improvement on the stills now in use, I shall most certainly strive to secure one for my use.

As the patents for Mr. Johnston's still were obtained through the SCIENTIFIC PRESS AGENCY for the United States, England and France, we will state the important points in the invention:

First—Economy of time in making a spirit entirely free from fusel oil or excess of acetic ether, at one operation.

Second—A saving of the usual cost of rectification by charcoal or any other means.

Third—Saving of waste and loss in exposing a large quantity of weak spirit to condensation, by the old process.

Fourth—Nothing is made by this still except high-proof spirit; the proof being entirely under the control of the operator.

There is at Bughey's vineyard, El Dorado county, two of these stills made of wood, working to one column and one worm. In the pipe leading from the stills to the column there are balanced valves, by means of which the stills can be worked alternately. When steam is turned on No. 1, it opens the valve leading to the column, and closes the valve on No. 2; and as soon as the spirit has been exhausted from No. 1, steam is turned on No. 2, closing the valve in No. 1. The pomace or wine is then discharged from No. 1, which is exchanged and ready for operation. When the spirit has been exhausted from No. 2, no time is lost in discharging and loading.

The spirituous vapor, on leaving the still, passes into the six-chambered column or rectifier. As it ascends through the different chambers, it encounters, in each, a coil of pipe containing cold water, by which the water and impurities are condensed and separated from the vapor. An uniform temperature is maintained in the upper chamber of the column by the flow of water through the pipes, so that spirit of any desired strength can be brought over, and nothing but high-proof spirit goes into the worm. The only portion of the spirit that requires redistillation is a few gallons which come over first on each charge, about 80 per cent. over proof, containing an excess of acetic ether.

There is every reason to believe that at no distant date California wine and brandy will rank second to none in the world. We need only the necessary experience and capital to conduct the business on proper principles and with proper apparatus. Let small vineyard growers sell their grapes and plant more vines, instead of wasting their time in making wine in dirty, sour casks. As well may every man who grows two or three hundred acres of grain have a mill and distillery to work up the same, as for the grape grower, with a few acres, to attempt to make his own wine and brandy.

Vines properly cultivated will be in full bearing at five years old, and yield an average of five or six tons per acre, which, at one cent per pound, amounts to $100, or $120 per acre. The cost of cultivating and gathering is from $20 to $30 per acre, showing a profit of $80 to $100 per acre.

Since the above was in type, we have noticed the following, from the *Evening Bulletin*, in reference to the working of the above still:

> SACRAMENTO, Feb. 10—7 P. M.—At noon to-day, B. N. Bugbey, of the celebrated Natoma Vineyard, displayed in the rooms of the Sergeant-at-Arms six cases of brandy, six cases of champagne, and six cases of still wines. Members of both Houses of the Legislature accepted the invitation to come in and taste. Tests were made of two qualities of French brandy, as compared with that of Bughey's manufacture, by W. G. English. The application of ten drops of ammoniated mixture of silver to the French production gave the liquor a deep inkish hue, while Bughey's, under the like ordeal, did not change color. The samples are on exhibition. Bughey's brandy came from Johnston's patent still, the only one ever built. The verdict was decidedly in favor of Natoma brandy, champagne and still wines. A prominent gentleman from a wine-growing district in the southern portion of the State at once ordered a supply of each, and many other orders followed.

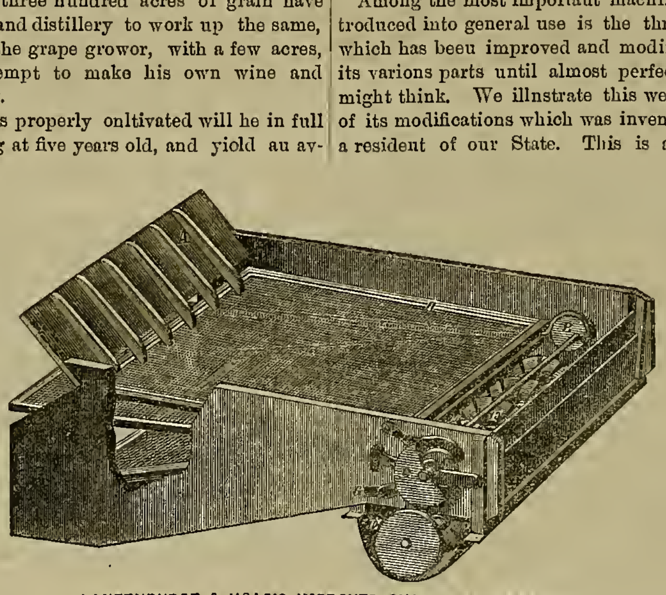
◆

SWAMP AND OVERFLOWED LANDS.—The House of Representatives has directed the Committee on Public Lands to define by law what is meant by swamp and overflowed lands.

Improved Shoe for Threshers.

The modification and improvement of agricultural machines have attracted the attention of inventors to a very high degree in our country. The broad fields and extensive farms owned by individuals have rendered necessary the use of machines to supply the want of manual labor in working on so large a scale. The inventive talent of our countrymen has been taxed to the utmost, and the result is that wonders have been accomplished.

Among the most important machines introduced into general use is the thresher, which has been improved and modified in its various parts until almost perfect, one might think. We illustrate this week one of its modifications which was invented by a resident of our State. This is an improvement on that part known as the shoe, which separates the grain from the straw, smaller seeds, etc., after passing through the threshing cylinder. It is very simple in its arrangement, and its construction can be seen readily from the illustration. The main points are the sieves and their manner of working, and the horizontal screw, F, for conveying the tailings to the elevator.



LANFENBURGE & HOAG'S IMPROVED SHOE FOR THRESHERS.

The upper sieve, H, inclines towards the screw, F, while the lower one inclines in the opposite direction. These are connected with the eccentrics, B and C, of the driving shaft, by means of curved rods and bell cranks, and in such a way that they move in opposite directions. The manner in which the upper sieve is thus connected is shown at B; that in which the lower is worked is shown at C and G. There is a middle sieve, shown in the engraving, which can be used, if necessary, for taking heavy substances from the grain and running them away from the machine.

Below the driving shaft is a trough, in which runs the screw, F, which is driven by a belt, which passes around E and D. The grain, etc., falls on the ribbed apron, A, and thence on H; and that part which does not pass through this sieve is carried, by means of the peculiar shaking and throwing motion imparted by the eccentric and by the inclination, into the trough, and thence transferred, by the revolution of F, out through one end to the elevator, in a uniform manner, and without being liable to choking up if it happens to be damp.

The advantages claimed for this machine are important. It is very easily adjusted, and in a short space of time. It is not liable to get out of working order, and runs lightly and without creating a jar on the frame of the thresher. Damp grain will not choke it, as is the case where small troughs are employed. It cleans the grain better, and takes less power to run it, than in the common machines used. There is but one stake ever needed to set it.

This device was patented in June, 1868, by Mr. M. Laufenhurge, and is now owned by this gentleman in company with Mr. J. C. Hoag. Their address is Bloomfield, Sonoma county, Cal. Mr. L. writes us that he has engaged seventy machines this year (1870), that he has given his invention many severe tests, and that he has threshed, in the most satisfactory manner, and without any clogging of the sieves, 3,000 and 4,000 bushels per day.

A small number of machines have been manufactured at the East with these patent shoes, and the inventor believes that they will soon be very generally used. All the castings can be obtained by applying to Messrs. Baker & Hamilton, of this city, who are the general agents for the Pacific coast. The royalty on the invention is twenty-five dollars, and the whole cost of the shoe (including royalty) is about fifty dollars,

◆

THE WIOKERSHAM STREET SWEEPER has been tried twice in this city, the last time on Tuesday last, when, unfortunately, the rain prevented many from witnessing the trial. This machine is in use in the Eastern cities, and Mr. A. Weed is trying to introduce it (with a few modifications) into use here. The iron-work for this was made at the Risdon Iron Works, the wood-work at Gallagher's wheelwright shop on Mission street, near Beale. The sweeper stands about eight feet high, and runs on two wheels six feet in diameter, which gear into other wheels so as to drive the brushes, which throw the dirt into a low car attached to the machine. These brushes are made of rattan, and can be raised or lowered some six or eight inches, as may be required. Several cars accompany one sweeper, and when one is filled with dirt it is detached and hauled off and another substituted. It is claimed that the sweeper will work without raising a dust. The public will have another opportunity to see it in operation in a day or two.

◆

THE CARSON CITY MINT.—The *Bulletin's* Washington correspondent says that the House Committee on Appropriations have agreed to omit this year all appropriations for this mint, except a sufficient sum to pay two workmen to take care of the property. They will also recommend the repeal of the law authorizing its maintenance. The Nevada delegation will oppose these measures.

Communications.

Smut in Wheat—Historical Memoranda.

[Written for the Scientific Press.]

Pliny and Columella notice diseases similar to mildew, sometimes, but improperly, called blight, and smut, as being found amongst growing cereal grains; and notice that at that period mixtures of water and urine and a decoction of cypress-leaves were employed to remedy the evil, and are recommended as specifics by the authors named. Virgil also recommends the lees of oil for the same purpose.

The father of modern husbandry, Mr. Jethro Tull, ascribed the presence of smut to moisture, and as a preventive recommends the adoption of his drill system of cultivation. As is often the case with highly observant, practical, but not scientific men, old Jethro was not far from the truth, though it is probable that the presence of smut is promoted by atmospheric moisture, rather than by the undue hydroscopic character of the soil.

During the last century the general opinion was, that smut was due to insects. A long list of Italian, French and English naturalists, of deservedly high reputation, could be given who supported this opinion. It may satisfy the reader that the skill and ability of parties entertaining this view has not been overrated, when it is mentioned that Linnæus was amongst the number. It may also be observed that this opinion was generally considered to be supported from the circumstance that "pickling" the seed sown was usually found to be a palliative, if not a preventive.

After old Jethro, Sir Hnmphrey Davy made the best guess at the true cause of smut—the first from personal observation, the latter by the more philosophic mode of inductive reasoning. These two opinions were almost typical of the mental characteristics of the two men. Sir H. Davy considered that smut was a small fungus. He arrived at this conclusion because he found, on analysis, that smut furnished products similar to those afforded by the puff-ball, and considered that without the agency of some organized structure, so complete a change could not be effected in the constitution of the grain.

Forencroy and Vanquelin made a most elaborate analysis of smut balls, without arriving at any conclusion as to the originating cause. The result, however, accorded with that made by Davy, and may be said to have lent strength to his views. Fontada was of opinion that the "black mildew," or smut, form real vegetables, perhaps of an imperfect kind; and that these, by absorbing the nutritive juices, enfeeble the plant and produce the injury. Wildenow ("Principles of Botany") considered that smut proceeded from a fungus. Such was the state of opinion on this long-debated subject, until it was taken up by the celebrated French naturalist M. Adolphe Brongniart, who clearly proved that smut arose from the presence of a fungus now commonly known as *Uredo carbo.*

Real or Assumed Preventives.

The earliest "pickle" employed to prevent the growth or spread of smut after those described as having been used during the Roman Empire, is brine. Tull, so often alluded to, relates that the use of salt brine, as a pickle, was discovered in consequence of sowing wheat that had been steeped in sea water, from having been taken out of a ship which had been sunk near Bristol, which sea-steeped seed-wheat was found, at harvest, to be free from smut, when nearly all the wheat in England was affected. In using brine, the general custom is to make it strong enough to float an egg.

At what time and by whom a solution of sulphate of copper, blue-stone or blue vitriol (for it passes under the three names) was first employed as a steep for seed-wheat, with the object of preventing smut, the writer cannot now state. It is probable that the practice was first introduced from France into England, in which latter country there exists records of its use nearly a century ago, and to the present day it is not employed so proportionately extensive as in the former country; salt being still more generally employed in the British Isles. The sulphates of copper employed in France are the varieties locally known as *vitriol Salzbourg* and *vitriol mixte Chyp're*—the former being a compound salt of sulphate of iron (green copperas) and sulphate of copper (blue copperas), and the latter of sulphate of copper, compounded with sulphate of zinc (white copperas), or, as they are sometimes called respectively, green, blue and white vitriol.

A knowledge of these terms may prevent mental confusion with many who may not be acquainted with the synonomous titles applied to the three varieties commonly known under the generic denominations of copperas and vitriol—both alchemical terms—the latter being based on the circumstance that vitriol (sulphuric acid) constitutes one of the salt-forming elements.

In Lincolnshire, the south of Yorkshire and portions of Northumberland, England, common arsenic (arsenious acid) is employed as a steep, and has been found more successful in preventing smut than bluestone; but an old observant Lincolnshire farmer informed the writer that he has known smut to follow after wheat had been steeped in solutions of salt, sulphate of copper and arsenic, although he never knew an instance of its affecting a wheat crop when the seed employed was two years old, or, rather, the produce of the last year, but one which would really be only about fourteen months old.

The use of arsenic as a steep appears from English newspapers, to have spread into the southern English counties, as a few years ago it was noticed that partridges were found dead, unaccountably, in the fields—a circumstance then attributable to some mysterious diseases; but it was subsequently ascertained that they had died from eating wheat which had been steeped in arsenic.

It would render this paper too long to enter into the *rationale* of the varied processes employed for steeping wheat, and their probable values under varied circumstances, or to give tables of various experiments made to test them. If, however, any considerable number of the agricultural readers of the Scientific Press should express a desire to possess the same, they can be furnished on a future occasion through its columns.

Thomas Rowlandson.

Horaoe Greeley on Migration discourses as follows. It will be remembered that Horace is one of the prime movers in getting up a colony for Colorado: I advise no man who has a farm anywhere, and is able to keep it, to sell out and migrate. I know men who make money by growing food within twenty miles of this city quite as fast as they could in the West. If you have money to buy and work it, and know how to make the most of it, I believe you may find land really as cheap, all things considered, in Vermont as in Wisconein or Arkansas. And yet I believe in migration—believe that there are thousands in the Eastern and Middle States who would improve their circumstances and prospects by migrating to the cheaper lands and broader opportunities of the West and South. For, in the first place, most men are by migration rendered more energetic and aspiring; thrown among strangers, they feel the necessity of exertion as they never felt it before. Needing almost everything, and obliged to rely wholly on themselves, they work in their new homes as they never did in their old; and the consequences are soon visible all around them. "A stern chase is a long chase," say the sailors; and he who buys a farm mainly on credit, intending to pay for it out of its proceeds, finds interest, taxes, sickness, bad seasons, hail, frost, tornadoes, floods, etc., deranging his calculations and impeding his progress, until he is often impelled to give it up in despair. There are men who can surmount every obstacle and defy discouragement—these need no advice; but there are thousands who, having little means and large families, can grow into a good farm more easily and more surely than they can pay for it; and these may wisely seek homes where population is sparse and land is consequently cheap. Doubtless, some migrate who might better have forborne; yet the instinct which draws our race towards sunset is, nevertheless, a true one. The East will not be depopulated; but the West will grow more rapidly in the course of the next twenty years than ever in the past. The railroads which have brought Kansas and Minneeota within three days and California within a week of us, have rendered this inevitable.

Mills and Mines of Colorado—No. V.

By Almarin B. Paul.

[Written for the Scientific Press.]

Bad weather, business, etc., have prevented my moving about much, hence the break in my letters. As a matter of interest to White Piners and Cerro Gordo smelters, I visited the

Callom Reduction Works,

Which are located at Swansea, some four miles below Georgetown. These works are upon a new plan, more so in Colorado than California, where the same principles have been tried at Meadow Lake, and are being tried now, to a certain extent, in Cerro Gordo, Inyo county. As they differ in one or two particulars, I will be minute.

The works are new and not yet completed or at work. The proprietors are Callom & Co., Mr. Callom being the inventor, and, I believe, the patentee. The ore is first reduced by the Dodge crusher, which is universally used here, and is really worthy of its popularity, being simple, cheap and efficient. From the crusher the ore passes into Cornish rollers, where it is more finely reduced. It then passes into bolters, where the ore is sized. The sized ore then passes into Callom's plunger concentrators, a short account of which I gave in letter No. 1. A more minute description I herewith send, clipped from the Georgetown *Miner*, which, by the way, is one of the best inland mining journals of any county. I give it, as all things appertaining to concentrations are of interest. At the same time looking at it put up for practical working, I do not regard it as equal to the Hendy or Hungerford concentrators:

"The body of each machine is a water-tight cistern or tank seven feet long, 3½ feet wide and three feet high. Its upper part is divided into three equal-sized compartments. The outer ones are occupied by two sieves, and the inner one is divided in the center, forming cases for two plungers. In the bottom of each plunger case is an aperture communicating with the space under the sieves. Standing immediately behind the machine is a trough furnished with two gas-pipes, which enter the plunger cases. The plungers are supported by spiral springs, and on the upper end of the plunger stems are adjustable thimbles, having on their top recesses for the reception of elastic cushions. Over the plunger stands the rocker, which is attached by a connecting rod to a crank on the driving shaft.

After the ore is crushed and screened, a small stream of water conveys it through a spout upon the sieves. Water passes from the trough through the gas-pipe into the plunger cases under the plungers. The rotating of the crank shaft imparts an oscillating motion to the rockers, which, at each oscillation, strike upon the cushioned thimbles and depress the plungers, causing the water to rise in a rapid succession of jets through the layer of ore upon the sieves, so that at each pulsation of the machine every particle of ore and rock is subjected to a momentary suspension in water, and this causes the different minerals in the mixed ore to arrange themselves according to their several specific gravities. The ores as they classify themselves are discharged into suitable receptacles on the outside. The quartz being the lightest, passes off through pipes, and is discharged into the tail race."

The concentrated ore is intended for

The Furnace.

This is a combined roasting and smelting furnace. The roasting chambers are three in number, one above the other, and are about twelve feet in length and five feet wide. The hearths are level, and the tops are regular arches extending their whole length. Extending through, and having a bearing at each end, are pipes, which support iron stirrers, which move mechanically to and fro. Through the pipes flows a stream of water to keep them cool during the process. The ore goes in at a hopper, above the first chamber, and is mechanically carried in time to the back end, where it falls into the chamber or hearth below. This hearth has a higher degree of heat, being so much nearer the fire. The ore here undergoes a similar stirring, and in due time is delivered at the opposite end into the third hearth, which has a still greater heat. It undergoes here the same operation and then is delivered into the inclined smelting hearth, which is directly underneath and supports the hearths above. The smelting hearth is some thirty-five feet in length, and at the extreme end, which is about ten feet further on, is the fire-place. A stack some forty feet high is connected with it. From the fire-place to the stack the fire has a draft of some eighty feet; thus: fire hearth, 10 feet; smelting hearth, 35 feet; three roasting hearths, 12 feet each, 36 feet. The furnace has been tried practically, and found to equal their expectations. To my eye it looks practical, and they have my best wishes for success.

Difference Between English and American Telegraphing.

In the course of a review of F. L. Pope's new hand-book for telegraph operators and electricians, *The Engineer* says:

The first principle of the telegraph circuit in America differs from that in use in England. On our lines, when the instruments are in repose, no current circulates in the line; and when a signal is given, it is effected by the transmission of one or more currents, whose duration, frequency and order determine its nature. On the American lines, however, the instruments are in repose when the lines and apparatus are traversed by a continuous galvanic current, the signals being given by interrupting it at intervals. With this fundamental difference in the two systems, it is natural that important differences in the nature of the apparatus employed, as well as in the directions and tendencies which the development of the art has assumed in the two countries, should be found.

In England, as well as in European countries generally, each station in a line, whether it is *end* or *intermediate*, is provided with a galvanic battery, and the signals are given by inserting this battery intermittently in the line circuit by means of a proper commutating manipulator. But, in America, only the end stations of telegraph lines are provided with batteries whose currents circulate in the same direction through the instruments at both the end and intermediate stations. With this plan of connection, therefore, a signal may be given from any station or point on the line and received at every other station by simply breaking the metallic circuit. This system has its especial advantages and disadvantages. The chief advantage consists in the fact that, by cutting the line wire at any part of the circuit, separating the severed ends, and re-touching them at proper intervals, a message may be transmitted to every station along the line without demanding any special apparatus on the part of the transmitter. Thus the guard of a train which has met with an accident far away from any station might communicate the news of his disaster and demand assistance without having to carry with him either battery or apparatus; whilst he could, by inserting between the severed ends of the wire a very simple and small pocket sounder, receive a reply. On English lines, to do this the guard would not only have to be supplied with apparatus, but likewise with batteries, which, in case of a collision, might be rendered useless when most needed. The disadvantages with which the American system is encumbered is, that the lines can be easily tapped by an enemy or for mischief.

Nothing new under the Sun.—The bicycle seems to have been known in China two centuries ago, and some forms of the velocipede were probably seen even earlier in Europe. In the ancient painted glass of the church of Stoke Pogis may be seen a youth riding the wheeled horse amid a throng of admiring spectators. The paddle-wheel for boats is seen on the Assyrian marbles; and it is now suggested that the pyramids of Egypt may be built of artificial stone, made in the same way as that which the French have used on the Suez canal. It is well known that no stone like that of the pyramids is to be found anywhere in the vicinity, and this fact lends plausibility to the supposition that it is a manufactured material.

California Brandy at New York.—The New York *Tribune* recently remarked that the brandy of California was the only article of that kind in the New York market fit for use.

Mechanical Progress.

Malleable Iron and Wrought Iron.

The specific gravity of malleable iron is 7.2; that of wrought iron is 7.7. The fracture of very carefully manufactured malleable iron appears more like that of a very fine-grained, white cast iron than that of wrought iron. In filing, turning, and planing, it works similar to wrought iron, above a cherry-red heat, but in endeavoring to beat it out, it breaks to pieces. According to Mallet, this temperature, and that beneath a bright yellow heat, are those at which it may be best forged. When hammered at yellow heat, malleable iron falls to pieces, and large, not uniformly cemented pieces, appear in the interior. It is clear that malleable iron cannot be welded properly; it is self-evident that it cannot be welded with wrought iron or steel, still it may be soldered with them, but the surface often appears somewhat whiter. Large pieces can seldom be turned to a great depth. According to some statements, malleable iron is capable of taking a better polish than cast iron, and as good a one as cast steel. It also holds a better luster than many sorts of dark and impure wrought iron. Good hard cast iron may probably be polished as well. With regard to the hardness, reliable data are not procurable. Malleable cast iron is generally softer than wrought iron of any kind. It takes the impression of the hammer with a very slight blow, and wears off rapidly in contact with rough surfaces. It is exceedingly porous, as may be expected from its small density. Cast iron bells are far more elastic than bells of malleable iron, producing also a higher and clearer sound.

"Morin and Tresca have found that the elasticity of malleable cast iron is considerably less than that of the most inferior wrought iron. Thin pieces, of a diameter not over one-quarter or three-eighths of an inch, may be bent while cold, without cracking; but they can rarely be restored to their original state without being fractured. Malleable iron will bear rolling to a small degree. All these manipulations bring about a closer grain, and a fracture similar to that of fine-grained steel-like iron. No instance is known where malleable iron has been drawn into wire; but this is possible, since it will bear a slight elongation, assuming thereby a finer grain. It may be pretty well forged at a low red heat. With respect to the fusing point, it lies above that of gray cast iron, but probably not above that of many sorts of white or hard cast iron, and certainly considerably below that of cast steel."

The above is condensed from an article prepared by Dr. Adolph Ott, for the *Journal of Applied Chemistry.*

The American Institute Premiums on Steam Engines.—The action of the judges on steam engines at the late Fair of the American Institute having been criticised, they have sent a communication to the *Scientific American,* in explanation and vindication of that action. We quote a part of the concluding paragraph: "With these facts before them the judges had no difficulty in deciding which was the *best engine,* and they plainly indicated that opinion by awarding the first premium to the Babcock & Wilcox engine 'for the *most perfect automatic expansion valve gearing.*' But they also felt that the trial having been made under certain rules, and the Corliss engine having shown the best results by the strict rendering of these rules, though that result was purely accidental, it, therefore, should have a first premium for those results. In giving this premium, however, it was expressly stated that it was 'for best results on net effective power shown at the trial,' and they added, 'for superior workmanship, and general arrangement of valves and valve gearing.'"

Another Lock-Nut.—The lock-nut patented by Messrs. Elliott & Seely, of New York, is illustrated by the *Artisan* as applied to the fish-plates of rail-joints. The bolt has upon it a washer, in the face of which is a recess into which a plate of sheet metal, put on next, fits. This plate has a curved slit on one side, making a tongue, which, bent outward, constitutes a spring pawl, and works in an annular ratchet on the under side of the nut, when that is screwed home.

The "Walter" Printing Machine.—This new and powerful machine was entirely designed and manufactured on the London *Times* premises. *Morgan's British Trade Journal* gives a description of it, from which we quote and condense: "The new invention does not in the least resemble any existing printing machine, unless it be the calendering machine, which has possibly furnished the type of it. At the printing end it looks like a collection of small cylinders or rollers. The paper, mounted on a huge reel as it comes from the paper mill, goes in at one end in an endless web, 3,300 yards in length, seems to fly through among the cylinders, and issues forth at the other in two descending torrents of sheets, accurately cut into lengths, and printed on both sides. The rapidity with which it works may be inferred from the fact that the printing cylinders (around which the stereotyped plates are fixed) while making their impressions on the paper, travel at the surprising speed of 200 revolutions a minute."

This machine requires only three boys and an overseer to work it, and turns out, per hour, 11,000 sheets printed on both sides. The Hoe requires eighteen men, and turns out 7,000.

A New Pigment.—A method of preparing a white oxide of lead, by treating either roasted galena or finely divided metallic lead in a furnace similar to that used in the manufacture of oxide of zinc, and collecting it with canvas bags in the same way, is spoken of by the *American Exchange and Review* as destined to effect a change in the manufacture of pigments. We quote: "The white oxide produced is nearly pure protoxide of lead, differing from ordinary litharge only in appearance. When roasted galena is employed, the resulting substance is contaminated somewhat by the presence of small amounts of sulphate and sulphite of lead, and by some oxide of zinc from the associated blende; but when the metallic lead is used, these do not exist in the new compound. This oxide of lead is peculiarly soft and mixes well with oil, producing a pigment almost equal in body and covering properties to the best white-lead produced by the old Dutch method. It is, therefore, well fitted for employment as a white paint, or as a basis for the preparation of certain colors."

Cigar-Making Machine.—The *Scientific American* illustrates and describes a new machine, which it says is destined to revolutionize the business of cigar making. By its aid, a girl can easily make 1,500 cigars per day. It consists, briefly, of two pairs of concave rollers, one of which pairs is in the upper part of the case, and the other in the lower part; these two parts closing together by a hinge. By the act of closing, the two pairs of rollers are geared together; and as the members of each pair revolve in opposite directions, a roll of tobacco, placed between, is equally compressed on all sides towards the center. The mouth end of the cigar is shaped by a "header" or conical recess, into which it is gently pushed by a spiral spring during the revolution. The apparatus may be run by steam, or by a treadle like that of a sewing machine.

The New York Machine Shops.—The *Tribune* says: "The fact is apparent in the circle of the machine shops that their proprietors are preparing for anticipated business, and are arranging their shops with a view to economy of space and a consequent withdrawal of the capital hitherto lying idle in city lots, which were used as receptacles for scrap-heaps and refuse stuff. Since the close of the war nearly every marine machine shop has been rebuilt and rearranged, so that before spring they will be in a better condition to receive orders than they have been for years."

File Cutting.—"The file passes next into the hands of the cutters, who are seated on spring-boards, before small anvils fastened in stone blocks, on both sides of the room, in order to get a strong light. The cutter, with a short, wedge-like chisel, held obliquely, deftly covers the file with closely indented lines or teeth, that are so accurate in width and depth as to seem hardly possible to be done by the work of men's hands."

Scientific Progress.

The "Niin" of Yucatan.

The Report of the U. S. Commissioners of Agriculture contains a communication from Dr. Schott, late of the Yucatan Scientific Commission, in which he gives some description of a single product of that country, specimens of which he has had analyzed by a New York chemist. We condense: "The niin (pronounced *neen*) is the grease of an insect bearing the same generic name. It may be considered akin to the cochineal; but they differ essentially, one serving as a dye, the other as a drying oil. It is a yellowish-brown, fatty mass, having a peculiar oily odor. It is neutral to test-paper. Its melting point is about 120° Fah., though, when once melted, it remains in a semi-fluid state with the temperature as low as 80° or 85°. When cooled to 10°, it becomes hard and brittle, like suet. At ordinary temperature, that is, about 60°, it is of a thick, pasty consistency, like ordinary lard. Its specific gravity at 60° is about ·92. It is not soluble in alcohol, either hot or cold. Dissolves freely in ether, with which it forms a yellow, oily liquid. Also in turpentine, with which it forms a liquid possessing peculiarly valuable properties for mixing delicate oil colors. Also in benzine, and in chloroform. Like some others of the animal fats, it contains a distinct volatile acid, peculiar to itself, which might be termed niinic acid. Like others, it contains a fluid oil—oleine—and a solid containing stearic, margaric, and other fatty acids.

A peculiarity of the niin seems to be its difficult saponification. The strongest ammonia has no saponifying action on it. With potash, it saponifies slowly and imperfectly. With soda it forms a soap only after extended boiling with a strong lye. It is only after several hours' boiling with oxide of lead that it forms the so-called "lead soap," and then the product is very imperfect.

When the niin is melted in a porcelain dish, and the resulting oil exposed to a continued and high heat (between 250° and 350° Fah.) for an hour, the residue in the dish will be found to have assumed a tough, flexible, varnish-like condition—a gelatinous mass no longer soluble in turpentine, or affected by heat or cold. If a piece of this is placed on porcelain, moistened with turpentine, and ignited, another remarkable change takes place; for, if the plate is slightly inclined as the mass burns, a thick, yellow, resinous oil or gum flows from it, which possesses most remarkable adhesiveness, closely resembling a thick solution of india-rubber, but which does not dry, retaining its half-fluid consistency for several days.

When the turpentine solution is exposed to the air in thin strata for a few days, it acquires the properties of a resinous varnish. If further developed, this property will make the niin of the greatest commercial value. The film of varnish is very elastic, and at the same time hard. Another valuable application could be found in the manufacture of water-proof fabrics. An excellent way of water-proofing would be to saturate the article with melted niin, and then expose it in an oven to considerable heat until the grease gelatinizes. By these means the niin becomes insoluble not only in water, but also in most of its solvents."

Formation of Ozone by Rapid Combustion.

The *Chemical Repertory* gives a paper upon this subject which was read on the 10th ult. before the Chemical Section of the New York Lyceum of Natural History, by Oscar Loew, Chemical Assistant in the New York City College. The paper was commented upon by Professors Wurtz, Seely, and others, who considered the discovery of great interest and importance. We quote:

"According to Schoenhein, in very slow oxidation there is a previous formation of ozone, ordinary oxygen not being able to combine directly with other elements. Clausius advanced in 1858 the hypothesis that ozone is oxygen in the state of *free atoms,* while common oxygen consists of compound *molecules,* of two combined atoms each. But the later investigations of Andrews and Tait, Babo and Soret, upon the volume of ozone do not favor this supposition, and Clausius modified his hypothesis thus: *Ozone is a compound of a single atom of original oxygen with a molecule of common oxygen.* This combination is but a loose one, and the power of oxidating possessed by ozone resides in the third atom of oxygen, which combines directly with elements leaving common oxygen behind. * * It seemed to me that at every combustion, even in the most rapid and energetic, this intermediate decomposition of the molecule of common oxygen must take place, if the single atoms will enter into combination with the elements, and that ozone or antozone could be detected in a flame, if the high temperature did not destroy it again as fast as it is formed.

To test this hypothesis, I blew a strong current of air through a tube into the flame of a Bunsen's burner and collected the air in a beaker glass. In a few seconds I had enough ozone to be distinguished readily by the intense smell and by the common tests, tincture of guaiacum, iodide of potassium, etc. This observation shows that not only in slow oxidation but also in rapid combustion an intermediate production of ozone occurs, and that it can be separated and isolated in this way."

Germs Suspended in the Atmosphere.

To prove that, even under the most favorable conditions, the gases of the air could not alone cause organisms to be produced, and that when such did occur they were due to floating germs already endowed with life, M. Pasteur prepared a flask with a long neck bent at various angles, but open at the end, and therein boiled a decoction of yeast. The flask was then left undisturbed for some days, during which time the gases were of course in daily circulation in and out through the tube or neck, owing to the daily and nightly change of temperature. Yet the fluid remained for an indefinite period without any trace of organic life. The conclusion was, that as the gases passed freely, while any floating germs would be likely to be arrested at the angles of the tube, the latter, and not the former, were probably the source of the organisms found in former experiments made without such angles. To settle the matter, the end of the tube was sealed, and the flask was inverted and shaken until some of the fluid passed into the angles, after which it was again left to itself. "In a short time the fluid in the angles exhibited indications of organic life, showing that the germs had been arrested there."

Separation of Arsenic and Antimony from Tin.—The following is from an article in *Silliman's Journal* for January by F. Wigglesworth Clarke, S. B.: "By availing myself of the solubility of the sulphides of tin in oxalic acid, I have been enabled to separate tin perfectly from arsenic and molybdenum, and almost perfectly from antimony. When only arsenic and antimony are to be separated from tin, I find it best to proceed as follows: to the solution containing the three metals, this solution being prepared in the usual manner for the precipitation of the sulphides, I add oxalic acid in the proportion of about twenty grams of the reagent for every gram of tin, taking care to have the whole so concentrated that the acid will crystallize out in the cold. I then heat to boiling, and pass in sulphuretted hydrogen for about twenty minutes. No precipitate appears at first, but as soon as the liquid is saturated with the gas, the sulphides of arsenic and antimony begin to fall, and in a very few moments are completely thrown down. Then, as usual, the whole should be allowed to stand about half an hour in a warm place before filtering. Every trace of arsenic and antimony is precipitated, so that in the filtrate from the sulphides neither of these metals can be discovered by Marsh's test, nor can any antimony stain be produced with zinc upon platinum."

An Appropriate Medal.—A medal of the alloy of palladium and hydrogenium was struck, not long before the death of Graham, to commemorate his discovery of the latter metal. It bears on one side the effigy of Queen Victoria, and on the other the name of Graham and the words "Palladium—Hydrogenium, 1869." The medal contains 900 times its own bulk of hydrogenium.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Items.—*Miner*, Feb. 5th: Leviathan Lower Tunnel running in as fast as men can push it.

Good Ore.—The M. C. Tunnel No. 3 has been running all the week in hard rock containing pockets, from which fine sack ore is obtained. A sample of the clay from one of these assayed $640 per ton.

Globe—A survey made this week shows that the drift must run 110 feet to cut the Hercules lode.

Silver Glance.—The whole face of this tunnel is now fair grade ore. Three weeks ago an average sample assayed $11; yesterday a similar average of the whole face assayed over $30.

Imperial.—This tunnel continues its course, notwithstanding announcements.

Items.—Mt. Bullion tunnel goes on.... Encouraging discoveries in Exchequer. ....Ore for a test will soon be sent to mill. ....Lower tunnel of Schenectady makes good progress.

The Tarshish.—*Chronicle*, 5th: We learn that the lower tunnel of the Tarshish Co. is in 350 feet and making good headway, although the rock has been harder.

AMADOR COUNTY.

The Oneida.—*Ledger*, 12th: The clean-up last week turned out better then they anticipated.

The Old Amador.—This mine, at Amador City, is worked vigorously, and proving valuable. They are now in a very large ledge, and taking out large quantities of rock that looks well.

BUTTE COUNTY.

Mountain Spring.—Cor. of Oroville *Record*, 12th: Most of the miners on the ridge have had water for two weeks. They have had water up as far as Franklin Hill—something I never knew before. It is running short now. The bed-rock tunnel at Lower Cascade is driven five feet per week. It is now in 125 feet, and is to run about 300 feet further before they reach the valley.

EL DORADO COUNTY.

Rich Quartz—Placerville *Democrat*, 12th: Van Hooker & Co. are taking out some very rich rock from a ledge on the west side of Cedar ravine. The rock shows free gold in considerable quantities. This is the second good ledge this company have opened during the last two months.

Gold Dust Shipped.—For the first eleven days of the present month, there has been sent by Wells, Fargo & Co., from this place, $23,455 in gold dust.

NEVADA COUNTY.

O'Connor Mine.—Grass Valley *Union*, 8th: From all appearances we believe that the O'Connor will give a more astonishing result at the next crushing that it did at the last. The affairs of the company will be regulated in a few days.

Gold Bars.—Monday, at Finley's, we noticed bars valued in the aggregate at $24,000, the gold being mostly from the Union Hill and Town Talk mines.

Allison Ranch.—9th: A gentleman informs us that splendid rock, like that of the old days, is coming out. The finer specimens are saved separately, but the dump pile shows very rich rock.

McLellan.—10th: This mine is taking out better rock than at any time in its history. The character of the sulphurets has changed for the better, and free gold is visible. The crushing of 50 tons began yesterday. The rock being crushed is not as good as that which is coming out.

Items.—The Coe mine is being pumped out, and ore will soon be raised....The West Eureka is working with excellent prospects. The ledge is well defined.... The William Penn has good rock at last. Yesterday some fine samples were sent to the office in Boston Ravine. In these, free gold is seen....Howard Hill mine is not to remain idle much longer. From the ledge, when it bore the name of "Lucky," upwards of $200,000 worth of gold came out.

Eureka—12th: Yesterday a piece of quartz weighing about 100 pounds, all through which the bright gold appears, and which is loaded also with heavy sulphurets, was sent to the surface.

Buckeye.—13th: There is a strong probability that the Buckeye claims, known also as the Stidger & Evans, have been sold to the London Pacific Co. Mr. McLean, the Supt. appointed by the company, is now in charge. We received yesterday a sample of the cement, which is flecked with gold.

Bowery.—*Gazette*, 8th: The last crushing paid $96 per ton, and they are now taking out better rock than ever.

Empire Mine.—Captain Lee, Supt., is taking from both shafts 40 tons a day. The 30-stamp mill is kept running constantly. One hundred and thirty men are employed in the mill and mine, and the pay roll amounts to $13,500 a month. A large amount of rich specimen rock has been taken out in the past few weeks.

Big Blast.—10th: The German Co. on Diamond creek let off a blast of 90 kegs of powder in their gravel claims on Tuesday, and did good execution.

School-Boy's Ledge.—12th: The boys at the Mud Flat school house, near Gold Flat, on Thursday were playing a game of "Prisoner's Base," and had a hole dug in the ground where they placed their "prisoners." While digging out this hole to make it larger, they struck a quartz ledge, from which they took out valuable specimens.

The Big Sale.—*Transcript*, 10th: We mentioned the proposed sale of the Buckeye Hill claims, in Bridgeport township, to an English company for $180,000. This is only for the claims proper. The Sweetland Creek, which was purchased some time ago, is included, making the entire price $200,000. The money is ready, and the bargain will be closed when the buyers are satisfied as to the title.

The School Boy.—12th: Nine boys own the ledge. It shows as fine a prospect as we have ever seen in surface rock. It is 18 inches wide. Same of 13th says the ledge is expanding, and at the depth of 15 feet filled the entire face of the shaft.

Mining Sale.—A twelfth interest in the Kansas claims, hydraulic, at Kate Hayes' Flat, Bridgeport township, was sold a few days ago to William Williams for $45,000.

San Juan.—13th: The Water Co. has reduced the price of water from 16⅔ cents per inch to 12½; and some claims which have been unworked are now being washed.

Latest.—*Union*, 15th: The Empire cleaned up yesterday after a run of 24 days, $23,725.

A Grass Valley telegram of the 16th says: The Webster Co. struck rich pay gravel in their claims in Alta Hill yesterday. The strike shows that the old Alta Hill lead run through the hill from Grass Valley to Rough and Ready. The Eureka mine cleaned up $26,000 yesterday—the result of 10 days' run.

PLACER COUNTY.

Rich Quartz.—Grass Valley *Miner*, 10th: We were shown yesterday at Findley & Co's, specimens of very rich rock from the St. Patrick ledge, near Auburn. We understand that the owners have pounded out $9,000 worth of gold in a mortar, the pestal of which is rigged on a spring pole. The Auburn *Herald* quotes this, and adds that the claim has just been sold to a Grass Valley company for $3,000.

Rattlesnake Bar.—Cor. of *Stars and Stripes*, 10th: This exceedingly dry season has been a serious drawback. It would be lively here if we had water, as there are more claims fitted up for work than for many years. Some of the old abandoned claims are taking a new start.

PLUMAS COUNTY.

Indian Valley.—Cor. of Quincy *National*, 5th: Some prospecting is being done in the neighborhood of Greenville. Round Valley is dull. Crescent is lively, and the mine pays as well as ever.

SAN DIEGO COUNTY.

Prospecting.—The *Union* says: We have just learned that a man who had been out on prospect, returned last evening and exchanged five ounces of dust for coin. He immediately procured a miners' outfit and started out again, refusing to tell where he had struck it. Mr. Hill struck a claim, where he washed out $2 worth of gold from four buckets of dirt.

SIERRA COUNTY.

Port Wine.—Cor. of *Messenger*, 12th: The Monte Cristo boys washed the little dirt they had on hand, and it panned out $5,000. They are getting along well with their bed-rock tunnel. The Union Co. are taking out good pay. The Old Eagle Co. washed what dirt they had, and it turned out better than they expected. They have struck good diggings in the hill this week. The old Never-Sweat, better known as Jack Cayote's claims, had quite a pile of dirt out; but the ditch broke one night, and that was the last of the dirt. I have heard it reported that the rock was softer in the Grass Flat tunnel.

The other day a large company, formed here, took up all the ground not claimed in Wahoo district, and mean to commence work in the spring.

Scales' Diggings.—Water is the cry from every one. The Council and Fair Play claims are being worked. They are the only ones that have water. Cox & Co's big tunnel is almost completed. When it is finished and they get their ditch in, it will give employment to 50 men.

Kanaka.—We learn that the mine is now a complete success. The new ledge found ten feet east of the old vein is from six to seven feet wide, encased in regular walls, and contains rich paying ore, so much decomposed, that never a blast is necessary, and ten men are able to get quartz enough out to keep the 20-stamp mill running. This new ledge is called Treasure. The copper-plates outside of the batteries at the mill give every 20 hours from 12 to 14 ounces of hard amalgam, equal in value to the whole expenses of mining and milling. The mill has been running three weeks.

SISKIYOU COUNTY.

Accidental.—Yreka *Union*, 4th: This newly discovered ledge at Humbug prospects well. Several specimens from it show free gold plentifully.

Roadside Diggings.—The Woodford claim, opposite the mouth of the Greenhorn, is being successfully worked, after lying idle three years. The owners are John A Fairchild and Mr. Dewitt.

TRINITY COUNTY.

Junction City.—*Journal*, 5th: Everybody is busy. Miners have plenty of water. This camp will render a good report.

Court-House Hill.—Martin & Edgecombe are opening a claim on Haskin's lot. The hill paid rich up as far as it could be mined without injuring any of the improvements. Judging from what has been taken out, Martin & Edgecombe's claim is good for one ounce per day to the man.

YUBA COUNTY.

Brown's Valley.—Cor. of *Appeal*, 13th: There is a good deal of excitement about the old mine known as the North Carolina; it has been lying idle since 1864, until two months ago, when four men re-located the claim and called it the Big Bug. They took out ten tons near the surface, which paid expenses. They then started an incline a few feet deeper, took out 12 tons more, and the result was $10.40 to the ton. The owners are Louis de Forest, Charles Hanson, Henry and Charles Smith. There has been some talk about a new mine in the rear of Judge Hall's house, called the Lodi, and owned by James Read, Hall and others. They are taking out rock which promises to pay well for their labor.

Timbuctoo.—Cor. of *Appeal*, Feb. 13th: Only five of the mining claims here are being worked. Those are the Bullard, Antone, Michigan, Esner and Babb. These are said to be paying tolerably well. The general opinion seems to be that the mines here have seen their best days. At the Bullard's (Warner's) claim I found Mr. Chase and force in the great tunnel, now nearly completed. They have been at work upon this nearly five years. The hydraulic, with six pipes, was being worked. The Union recently made a clean up of dirt saved from last June, and took out about $8,000. The claim is not being worked, nor will it until expenses for water can be decreased.

Arizona.

Mining Items.—Prescott *Miner*, Jan. 29th: England Gulch still pays well. The 25 men on Lower Lynx creek are making small wages, with rockers. Some of those in the creek near the old Mexican camp, are doing remarkably well. Theophile Lansuillon informs us that a miner from the camp had that morning paid him one ounce of fine gold dust, which he dug out in two days. Chas. Otten and other placer miners came to town Sunday, from the headwaters of the Hassayampa, and, after purchasing supplies, returned.

Quartz.—Our only two working mills—the Vulture and Big Bug—are at work, and we are confident—paying.

Walnut Grove.—J. M. Tiernan writes: "I am well pleased with the mines. I have built a furnace for desulphurizing ores, and an amalgamating pan, which I will have in operation in a few days."

Colorado.

Bullion.—Georgetown *Miner*, Feb. 3d: The total shipments during the past week were, in coin value, $8,860.

Reduction Works.—Collom & Co's at Swansea, four miles below town, will soon be complete. They contain a patent ore-dressing machine of Mr. Collom's own invention. Part of the furnace arrangement is also an invention of Mr. C. The capacity of the dressing works is 40 tons per day, and that of the roasting and smelting furnaces 10 tons.

Cliff Lode.—Work will be resumed in a short time. It was discontinued last spring on account of water at the depth of 105 feet Sixteen hundred pounds of Cliff ore treated at Stewart's last year gave a yield of $850 per ton.

Fairmount.—The main shaft has reached a depth of 100 feet. The crevice is clearly defined. The distance between walls is 4½ feet. Selected samples of ore assayed $1,424.30 in gold, and $159.97 in silver, aggregating $1,584.27 per ton. The trial run of the mill was made on 10½ tons of ore. Sixty per cent. of the fire assay was obtained, being $28 per ton. The full capacity of the works will be 20 tons per day.

Briggs' Mine.—Central City *Register*, Feb. 3d: A magnificent lump of gold retort weighing 420 ounces and valued at $8,400. has been produced from mill ore since Jan. 3d. During this time Mr. Beech has sold to the smelting works, 40 tons of first-class ore, which will amount to $3,000 more, making the total yield for the month nearly $12,000.

Items.—Work has been resumed on the Bates, under the direction of Mr. Miley, who with Mr. Sensenderfer has leased the property....Mr. Stevens has rented the old Stanton mill, and proposes to run it on Bobtail ore....The Chicago mill is being repaired by Geo. Wells, and will run on Burroughs ore....Cyrus Hurd, Jr., will start his mill in a few days on ore from the Harsh lode....Miley has his engine up, and will start again shortly.

Empire.—Georgetown Cor. of same: Haskins & Grove are working the Paul Process. Several tons of Silver Mountain ore yielded 46 dwts. gold per ton. Dr. Rae and Mr. Davis are still experimenting on desulphurizing with peat. Several lodes are being worked, and all the mills are running.

Idaho District.—*Herald*, Jan. 26th: The Shafter lode, Hugel gulch, is one of the best. The ore improves in quality as work progresses. Last week a quantity of select ore was shipped to Chicago. E. C. Prehle of this city, is about to put up a mill near the mouth of Hugel gulch to run on ore from this mine.

Idaho.

Baxter.—*Tidal Wave*, Feb. 10th: This mine is developing finely. Last Saturday we were shown a rich and beautiful specimen which weighed five or six pounds. One side was literally full of ruby silver, some of which was beautifully crystallized. It was taken 45 feet north from the main shaft, and 220 feet from the surface.

Home Resort.—Judge McDaniels and others have leased the mine and are taking out ore which will net handsomely if properly worked. The shaft is down 20 feet, and shows rich in gold.

Flint.—Mr. Chas. Isenbeck informs us that rock of extraordinary richness is being taken from the Pioneer.

Northern Idaho.—A correspondent from Warrens' Diggings says that the miners at that place have concluded to permit Chinamen to work the old placers next season.

Montana.

Lincoln Gulch.—Cor. of Helena *Gazette*, Feb. 3d: "Claim No. 14 is working 20 men. Seventeen is taking out dumps in the Upper Drain Co. No. 16 is making calculations on doing big work in the spring. Nos. 27 and 28 have piled up on their claim this winter 400 feet of timbers. On 29 they are taking out dumps. No. 30 is washing dirt with good results. No. 32 is also washing and making small wages. No. 33 cleaned up for the week's run, with four men, $680. No. 34 is good. Nos. 35 and 36 have nothing worth mentioning. No. 37 is considered as good ground as there is in the gulch. There is no more work until you get down to No. 50. The latter having finished their ditch up to No. 38, have moved down there to commence taking out pay dirt.

Beaverhead.—Virginia *Times*, Feb. 4th: Placer mining will be more extensive than in any previous season. The ditches now completed will furnish water in any part of the gulch, and the diggings are 12 miles in extent. Much gravel is being taken out for spring washing, and many persons are working with rockers. The old quartz men are still at work. Andrew Murray, the pioneer, is raising ore from the Blue Wing. A quantity of this has been smelted in the Stapleton furnace with a gratifying result. Geo. Brown is extracting rock from the St. Paul lode. Many leads are being developed in the vicinity of Banuack and Marysville. The Cherokee, Waddam and Dakotah are being worked. Work on the Hopkins shaft has been suspended till spring. Col. Hardwood, of the Huron Co., is sinking a shaft through the bedrock in Bannack City. Col. Softwood, of the New Jersey Co., is opening leads preparatory to starting his mill in the spring.

Nevada.

COPE DISTRICT.

BALD MOUNTAIN.—Elko *Independent*, Feb. 12th: John H. Foreman & Co. left on Wednesday with a complete outfit for their new district. They intend shipping ore from the Nevada mine, and when spring opens, will develop others. The owners of the Silver King will commence work in 60 days.

Work has been commenced on the Congress mine, Mountain City, owned by McKitrick, Savage & Co.

HUMBOLDT.

BUENA VISTA MINE.—*Register*, 12th: Parties from Battle Mountain report that an extraordinarily rich body of ore has been struck in the Buena Vista by Robert McBeth & Co.

GOLD RUN.—The mines are proving rich. F. A. Shaw, Supt. of the Cumberland, is extracting large quantities of first-class ore. The Register are running a tunnel to tap their mine at a greater depth than any yet attained in the district. A large quantity of ore is now at Golconda for transportation to the English Co's mill at Reno. Hurst & Burns have struck ore in the Shephardson, samples of which have been sent below for working process. The strike exposes a body of ore five feet wide, that assays up in the hundreds.

BATTLE MOUNTAIN.—In the Grant mine, a few days ago, at a depth of 40 feet, a fine ledge three feet wide, which assays from $60 to $200 per ton, was struck, and arrangements are being made for working several tons by mill process.

REESE RIVER.

BULLION.—*Reveille*, 9th: The Manhattan Co. shipped to-day, overland to New York, eight bars valued at $12,156.20. This mill for the week ending Feb. 5th, produced 22,498 ounces.

QUARTERLY RETURNS.—The entire ore product of Lander county for the quarter ending with last December, is 993½ tons, about one-half the amount produced during the previous quarter. The total value is $163,475, which gives an average of $164.42 per ton, it being understood that the computations are in gold. The Assessor's returns are imperfect and indefinite.

MINERAL HILL.—Same of 11th: A correspondent says a number of claims have been located at the foot of the hill where rich ore was discovered; also, at a point two or three miles south. The deepest incline is that of Ward & Co., 60 feet, at the bottom of which is a large body of good ore. About two weeks ago this company shipped 10½ tons to Reno, to be worked by the Stetefeldt process. The first quality of which there were five tons, yielded $798.75 per ton; and the remaining 5½ tons, $500 per ton.

The Supt. of the English Co., which bought the Lane & Fuller property, has arrived at Austin.

WASHOE.

YELLOW JACKET.—Gold Hill *News*, February 12th; The new body of ore at the 1,000-foot level, increases in size. and is of good grade. It is a very important discovery. The sinking of the south shaft is progressing. The lower levels are yielding 120 tons of fair ore per day, and the upper 140 tons.

OPHIR.—There is yet 175 feet of water to drain out of the old mine, through the new shaft, in which the water is 100 feet deep.

SAVAGE.—There is little of a very encouraging character to be seen in any part of the mine. The receipts for January amounted to $25,560.

HALE & NORCROSS.—The daily yield is 200 tons; principally from the lowest level, at which point the new body looks exceedingly well.

IMPERIAL-EMPIRE.—The new hoisting engine arrived yesterday. It is 120-horse power. As soon as it can be got into operation, sinking will be resumed. The drift north, at the 1,100-foot level, is in 73 feet. The rock is hard.

GOULD & CURRY.—No improvement, except in the quality of ore, which is yielded from the upper workings at the rate of 40 tons per day, assays averaging $53. Receipts for January, $18,238.75.

CHOLLAR-POTOSI.—The drift west from the new shaft, at the 450-foot station, is in over 100 feet. Receipts for January, $115,263.37. Present daily yield, 150 tons. Average assays, $43.

WHITE PINE.

THE *News* says it is currently reported that Col. Buel's agent has sold mining property in Eureka to an English company to the amount of $300,000.

MINING ITEMS.—*News*, 9th: Total bullion shipped yesterday from Hamilton and Treasure City, $13.277....Van Wyck & Co's furnace starts to-day....Evening Star Consolidated and Mahogany Cañon is again being worked....10th: Silver Wedge yesterday sent 16 tons of ore to Swansea mill, and will add 14 tons to-day....The Nevada mill started yesterday on 11 tons from Ely District....Bullion shipped yesterday from Treasure City, $3,844....11th: Bullion yesterday from Hamilton, $14,583—all East.....The Independence will commence shipping ore to mill to-day. There is 30 tons on dump, which assays from $84 to $147....McIntosh & Barclay yesterday shipped 36,000 pounds of base bullion from the White Pine Smelting Works....The Hillyer and Howe metal mines were reöpened this week and fine ore was struck....The Dayton and Manhattan mills (jointly, 44 stamps) will shut down this morning. The batteries will be cleaned up to-morrow....12th: At Hall & Co's works 65 bars of bullion were turned out in 30 hours' run, each weighing 125 pounds....We have seen some assays from Old Kentucky Home mine, running from $40.83 to $241.90 to the ton in silver....Bullion shipped yesterday from Hamilton, $2,043....Evarts & Co. shipped this week from the furnace of Rathburn & Co., 10,697 pounds of base bullion.

New Mexico.

QUARTZ ITEMS.—Elizabethtown *Telegraph*, Jan. 29th: Conly & Co. are deepening their shaft on the Atlantic lode, at Last Chance. They are down 70 feet. Young & Co. have begun a new shaft on the Great Eastern. Mr. Pease crushed a pound of rock from this lode in a mortar and pounded out eight cents—equal to $160 per ton. Pease & McCollum are down 25 feet on the IXL, the vein looks well. McRay, Biddle & Co. are opening the Ophir lode, near Nigger Gulch. Their rock is rich. Graham & Dimmick expect to start up their 25-stamp mill in a short time. Thos. Martin is sinking a shaft on Irish Flats, a half mile west of the city. He has sunk through 30 feet of pay gravel.

CIMARRON.—J. H. Mitchell reports the discovery of gold quartz near the head of the Little Cimarron, 12 miles south of Cimarron Cañon. The vein is four feet wide.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Feb. 17, 1870.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 10 per cent.:

	Per ton.		Per ton
12 per cent. ores	$24 00	18 per cent. ores	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

THE WHITE PINE NEWS.—This journal, which a short time since removed from Treasure City to Hamilton, has resumed its daily issue. This has a healthy look, and indicates an abiding faith in the future of the district. We wish it well.

San Francisco Mining Stock Market.

The mining share market, during the week under review, has been characterized by about the usual activity noticeable for several weeks past, and sales of several prominent stocks were quite large; however, upon the whole, prices have been well maintained.

The San Francisco Stock and Exchange Board will hold no session on the 22d inst., (Washington's Birthday) and only one session (from 10 to 11 A. M.) on the 23d and 24th, on account of the Musical Festival in aid of the Mercantile Library Association, to be held on those days.

CHOLLAR-POTOSI — was somewhat less active than during the previous week, but realized better prices. During the week ending February 11th, 1,220 tons of ore were extracted, against 1,075 tons the previous week. We learn of no material change in the ore localities of this mine. The drift from the Chollar-Potosi shaft is now 123 feet in length, 61 feet having been added since the previous weekly statement. On the 11th inst., $17,486 39 in bullion was sent forward to the office in this city.

GOULD & CURRY — was in much better request, and at improved rates. For the week ending February 14th, 195 tons of ore were taken from the old ore-chambers. These ore localities are reported to have improved, both in abundance and quality, the particular sections showing the most improvement being the drift from the 20th floor and the United States Tunnel. At the 7th station, work south of the shaft is suspended. The main north drift, cross-cut No. 1 and cross-cut No. 2, to the west, are all being pushed ahead rapidly. These cross-cuts are 00 feet apart, and both have considerable water.

HALE & NORCROSS—was not in the market to a very great extent, though prices have been well sustained. During the week closing with the 12th inst. 599 tons were extracted, the ore coming from the following localities: 175-level, 192½ tons; 300 level, 51; 3d station, 123; and 6th station, 232½. On hand, 6,784½ tons, of which 2,485 tons is low grade. On the 15th inst., $25,050 in bullion was sent forward from this mine. With regard to the mine, we learn that the south body of ore heretofore spoken of, lying between the third and fifth level, is now thoroughly drained by the south drift on the third level, and they are now prepared to extract this ore. On the sixth level they are breasting out south of the shaft, and at this point most of the ore is in the south face, about fifteen feet wide, and of a better quality than on the level above, directly over this point. The ore-breasts north on this level are without any material change, and in the upper mine the ore localities are reported to be looking well.

OVERMAN—continues rather quiet. Letters of the 13th state that the 500-level has been connected with the 400 by the "raise," and they find the ore fully as good, and more abundant. By this connection they will be enabled to extract double the quantity of ore. For the week ending February 13th, 304 tons were extracted from the 225-level; upper tunnel, 369; 500-level, 164; and 400-level, 43, making a total of 880 tons, against 738 tons the previous week. On the 14th they shipped six lots of crude bullion, valued at $15,400.——IMPERIAL levied an assessment of $10 per share on the 15th inst.——DANEY levied an assessment of $1 per share on the 9th inst.——KENTUCK receipts of bullion in January, $31,207.——IDA ELLMORE (Idaho) reports bullion receipts in January to the amount of $22,900. A dividend of $1 per share was paid on the 8th inst.—*Commercial Herald.*

THE SCIENTIFIC PRESS.—*An Illustrated Journal of Scientific and Industrial Progress, Mining, Farming, and Mechanic Arts.* Vol. XX., No. 1. January 1, 1870. San Francisco: Dewey & Co. We welcome the first number of the new volume of this our contemporary, whose indefatigable efforts to promote the intellectual progress of the working classes, reflect credit upon the Pacific slope.

The price of the Press has been reduced, and is now equal to that of this journal ($4). We wish the enterprising proprietors a great increase in the list of subscribers, as a consequence. They say they intend to make it a *live* paper; and they have already succeeded.

Besides sound editorials on leading industrial topics, every number contains an amount of information worth many times the price of subscription for the whole year.—*N. Y. Engineering and Mining Journal.*

* * *

THE GRAND MUSICAL FESTIVAL on Tuesday, Wednesday and Thursday next promises to be a success and a very rare treat.

* * *

A PRETTY sharp earthquake shock was felt in this city Thursday, doing no damage.

The People's G. & S. M. Co., Sierra County.

In reply to our earnest request for information with regard to this company, we received the following letter:

EDITORS PRESS:—I noticed in your paper an inquiry concerning the People's Mining Company. Their mine is located on Kanaka creek, about half a mile from Alleghany. They have a ten-stamp mill. Their property was sold about eight months ago for $250, and a Sheriff's deed of it was given to Samuel Newell (who has had the management of it for the last five years) about two weeks since. Mr. Newell is at present living in Alleghany. They have a tunnel within about fifteen feet of the ledge, which will tap the ledge about one hundred feet below the surface; but there is no present prospect of the completion of this tunnel.

We subsequently recived a communication from Mr. Newell on the subject. The substance of the letter is, that the claim was worked for about two years with good prospects of success; that, however, owing to "the profligate waste, extravagance and shameful peculations by both the President and Treasurer," the enterprise was fatally crippled about four years ago; that Mr. N. kept the work progressing slowly by his own means until nearly $50,000 were due him, urging the stockholders and officers to relieve him or take measures to carry on a still promising work; that he received no aid; and that finally the property was sold last April under judicial process. The new owners have finished the work at much expense, put things into "a thorough paying condition," and will commence milling as soon as the season opens for work. Before milling commences old *bona fide* stockholders may obtain a number of shares in the new company, equal to the number they held in the old one, by paying an assessment of thirty-five cents (coin) per share. No one has as yet accepted this proposition. Mr. N. cannot find our correspondent's name in the list of stockholders, "but as the officers issued a large number of shares for their own use and benefit, he probably may be among that class of holders."

OBITUARY NOTICE.—Died, after a lingering illness of four years, the People's Mining Co., of Sierra county. The deceased commenced life with bright prospects, but owing to want of care and to exposure to harassing debt, its days were brought to an untimely end by a dreadful illness known as the Wall street fever. There are suspicions and charges of foul play, which can be investigated only by examinations of the books and accounts, for which a call may be made at the office in New York. We sympathize deeply with the friends of the departed in their loss, but can only advise them hereafter not to lay up their treasures in the deep pockets of stock sharps (who sell the worthless garments of decaying mines to honest, unsuspecting people), for there moths and rust do corrupt and thieves break through and steal.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

The Agricultural Department at Washington.

We regret to observe that an effort is being made to abolish the Agricultural Bureau at Washington; but we trust such a suicidal policy will not be carried out. This department has been but recently organized; yet, considering the term of its existence and the pecuniary means placed at its disposal, it has accomplished a vast amount of permanent good.

Whatever means of retrenchment may be decided on, it will be poor economy to stint in the allowance for this. Even in the proposed reform of the franking privilege, greatly as such reform is needed, the free distribution of the agricultural and patent reports should be provided for—not perhaps in the loose way in which they are now too generally sent out; but all who signify their desire, by letter or otherwise, to the members of Congress from their respective districts, should be entitled to receive copies of those documents post free. The annual publications sent out from these departments are of far more real value to the people of the country, than any other public documents which emanate from the seat of national government.

During a recent visit to Washington we took occasion to inspect the various departments connected with this bureau, and became more satisfied than ever of its value to the country. The system of exchanges of plants and seeds, which has been instituted between this and other countries, and their free distribution, is of very great value to the entire people. Prof. Glover's collections of insects, destructive or otherwise, to plant growth, with the facts connected with their production, their habits, the mode of destroying them or preventing their appearance, etc., etc., is of the highest importance. It would be economy of a high order, and policy most sound, if the government would provide the necessary means to spread this information *free* before the agricultural masses of the country. The result would be the saving of millions, annually, and the creation of actual values to that extent. The Department of Agricultural Chemistry and Geology—the basis and preliminary to scientific agriculture—and the Statistical Department, are also doing much to forward the greatest and most important industry of the country.

This is eminently a *working* department, and no place for drones or hangers-on; and, notwithstanding the flippant disparagement of it in which certain classes of newspaper scribblers indulge, the information here collected and disseminated is eagerly sought after by a large class of the most intelligent, industrious and useful people in the country. The deprivation of this information, or any interference with its collection, would be nothing short of a national calamity.

A New California Cherry.—Mr. W. W. Smith, of Napa City, writes to the *Rural New-Yorker* that he has possession of a seed, originated in the valley, the fruit of which is "the finest he ever saw. It possesses characteristics of the Black Tartarian, and is probably a seedling of it, but in fruit it is far superior." Mr. Smith says all varieties of the cherry do well with him, and the past season he shipped six tons of the fruit to San Francisco.

To Remove Stumps.—A stump of large size can be removed at a cost of fifty cents by simply boring a hole through the stump or tree, at the base near the ground, and pouring a pint of crude oil into the hole and setting fire to it. The fire will soon burn the stump down three feet below the ground.

Selecting Breeding Animals.

Why do so many sows of choice breed, beautiful animals in every respect, so far as the eye can see, bring forth only two or three pigs at one litter? and why do others, of the same breed, and, so far as appearances indicate, equally as promising, bring forth young equalling in number the teats on the udder? Intelligent breeders have answered this question, and proven the correctness of the answer by long and careful observation. We are told that in every brood of pigs, in every flock of lambs, in every herd of cattle, in every band of horses, in every nest of birds, in every natural brood of domestic fowls, and in every ear of corn or grain, Dame Nature makes special provision for the propagation of its kind, by concentrating the excellencies of the entire litter, flock, herd, nest or ear in some one animal or seed, which, more than any other of its fellows, possesses the power to keep up to its highest standard of excellence the peculiarities of its race or kind.

In no animal can this distinctive individual be so definitely and easily pointed out as in the pig. Every farmer knows that each little youngling of a well-bred sow, within two or three days after birth, instinctively chooses, and ever after keeps, his own particular teat at the udder. After this choice is once made, in all the after rough-and-tumble, in seeking for food, each little pig brings up at its proper and regular place, at the maternal "lay out," with as much accuracy as well-drilled soldiers find their places in line, in response to the order to "fall in."

When the litter is all thus in place, it is "graded," by Nature herself, with an accuracy which no human art or judgment can equal. The leader of the band, and the one which is best fitted, *par excellence*, for the propagation of the species, occupies the place at the head of the dinner-table; while the one that possesses the least stamina—the "runt" or "titman"—is crowded to the rear end of the udder, and corresponds to the "nubbin of corn" or the diminutive kernels at the tip end of an ear of grain. The order in which the pigs are arranged at the udder, corresponds to their powers for propagation.

When choice animals only are desired, always select for breeders the forward one at the udder, male or female. It would be well never to go far down the table for breeders; and, lest mistakes may arise, always make your selection before weaning time comes. The second or third pig may, to all appearance, be as beautiful and thrifty as the first, and may possibly make as heavy an animal when slaughtered, or heavier; and for once or twice may bring as full and large a progeny; but in the long run they will be sure to fail. The law is established and incontrovertible; and, as has been often said and sung,

"A sow pig and boar pig that sucketh before"

should always be chosen for breeders.

It is not always the most beautiful that should be selected as breeders, from any family of animals; but the ones that are capable of transmitting the most excellent points to their progeny. With the pig, this selection is easily made by attending to the above; in other animals, more care and judgment is required. Breeders of stock, of any kind, to succeed, must make themselves familiar with the unalterable laws of procreation and transmission. When these laws are carefully and intelligently observed, there is no tendency among animals to degenerate; but without such care, that tendency is manifest and rapid in its effects.

If we subject a herd of improved horned stock to poor and scanty fare, and insufficient protection from the weather, and in that state allow them to breed without proper discrimination, they will speedily lose their fine qualities and improved points. Experience has fully shown that improved foreign breeds of sheep thus treated, soon assimilate to "natives." Merinos and long-wools thus rapidly retrograde toward the unimproved types. The same is true of all domestic animals. In a wild state, Nature has provided that animals shall always "select" by instinct. This is especially true of the horse. There is not a truer saying in the whole catalogue of aphorisms than that "Nothing is granted to mortals without great labor," and in nothing does this saying more aptly apply than in the breeding of domestic animals.

Farmers Victimized.—The Stockton *Independent* is informed by a correspondent from Ellis Station, that some time ago several farmers in that neighborhood sent their entire crops of barley to a commission merchant in this city, with instructions to store and await a rise in the market; the merchant promptly forwarded 25 per cent. advance on the consignments, and they supposed all was right. After the lapse of two or three months, some of the parties visited the city for the purpose of settling up with their consignee and getting the balance of their money. The city merchant, being encountered in the street, appointed an hour when he would meet them at his office, but failed to appear. After waiting several days, and failing to hear from him, the farmers found, on inquiry, that they had been victimized; as the barley had been *sold* on the day of its arrival. Several weeks further having elapsed, and no tidings coming from the merchant, the parties concluded to make this public *expose*, as a warning to others to beware how they trusted their business to unknown and unreliable adventurers. Why not give the name of the swindler?

Goat Meat Better than Mutton.—The trial of taste came off January 29th at Mal Paso bridge, between Gilroy and San Juan. Forty or fifty persons were present from each of the above places, and there were six tasters on each side. There was a bountiful repast for all, a speech, and a vote of thanks, as well as the toasting. The *Central Californian* says the twelve tasters deposited their ballots with the following result: In the pan containing the sheep meat were deposited twelve ballots, four of which pronounced the meat first-class and eight second-class; and in the vessel filled with goat-meat were cast a like number, eight of which declared for first-class, and four for second-class. It will be seen by this that the goat meat had a majority of votes as being first-class.

Thrashing Corn in a Thrashing Machine.—At a recent meeting of the Western New York Farmers' Club, Shelby Reed exhibited a quantity of corn cobs and stalks which had been passed through an ordinary thrashing machine. The grain was pretty thoroughly separated from the cob, and the latter, with the stalks and husks, mashed fine. Members of the Club thought the fodder would heat if stored in stacks in that fine condition; besides the soft and sound corn could not be separated. It was suggested that it might be a good process in cases where both stalks and grain were to be fed immediately to stock. Mr. R. stated that it took from three to four minutes to thrash a shock containing a bushel and a half of ears.

Joint Corn—Something New.—The *American Agriculturist* speaks of a variety of corn, that has recently been shown to the editor, which is, at least, a curiosity, if not something of value. It produces an ear at each joint. Each of the several stalks shown had from eight to twelve ears upon them. It is small in the ear and grain, much like pop-corn; but if, as is claimed, it will yield 200 bushels to the acre, it must prove very valuable.

Fatal Disease among Horses.—A new and strange disease has appeared among horses in and around Woodland, Yolo county. The disease is said to be fatal in a few hours. All horses that have been taken with this malady have died.

Smut.—A very interesting communication on smut in wheat will be found on the second page of our present issue.

Chicken Raising in Alameda.

[Written for the Scientific Press.]

At the grounds of E. Nichols & Son, Fruit Vale, I saw something novel in the way of chicken breeding. These gentlemen breed pure stock—the White Leghorn and Bramah Poota varieties. The former are small, active fowls, resembling the Black Spanish in every particular except color, which is a beautiful white, with a slight changeable golden shade.

The Bramah Pootas are large, lazy-looking birds, weighing eight to ten pounds each. Color, white, mottled with chocolate, and having a dull golden tinge to the long feathers.

It is claimed that the White Leghorns are perpetual layers, and never try to set. The great number of eggs produced constitute the special merits of this breed. The Bramah Pootas lay larger eggs, and make excellent mothers; attending and sheltering their brood with warm affection. Being so large, they cover many eggs, and are valuable to keep for hatching and nursing. As a market fowl, their flesh is white plump, and very tender—a most profitable sort.

Mr. Nichols makes the chicken business a specialty, and systematizes things accordingly; and I was interested to learn his method. Cleanliness and purification—thorough and effectual—with pure water and liberal feed, keep the birds in full plumage and healthful condition.

Roosts.

His roost-houses are tight-roofed, but *well ventilated*—movable little houses, four by six, and only five feet high. The hens have no flying to do, but can hop into the house and up to the roost without injury. The movable houses allow such changes of location as may be desirable, and are easily kept clean.

Nests.

The nests are in roofed boxes, the size of common apple boxes, open at one end, and also movable. The advantage in this arrangement is quite apparent. They can be placed under lee of fences, or in the open yard, or under shelter. Each nest being kept separate, is clear of any contagious filth. Mr. N. occasionally fumigates the boxes by burning the straw in the same, using care, of course, not to consume the box. He says that his poultry are never troubled with any sickness, and I believe it.

Feedings.

He feeds young chicks several times a day, giving hard-boiled eggs, corn meal and oat meal. The large chickens and hens are fed three times daily—corn meal in the morning, and corn at noon and night. Burned shells and bones are always in reach.

Remarks.

While commending him highly for his admirable arrangements, I must suggest that I think a greater variety of food advisable. Neither wheat nor corn alone is as good as both wheat and corn. Some experience and much comparative observation has convinced me that a *variety* of food is better than any one sort alone, for economic reasons. The difference in the chemical composition and digestive qualities of grains, seeds, etc., in connection with the physical wants of vital beings, strengthens my position in theory also. It is the nature of fowls to pick a great variety of seeds, fruits, insects, etc., even when plenty of corn or wheat is within reach. The prejudice against feeding wheat comes mainly from the ignorant or careless—from the fatal effects of feeding smut wheat! "Chicken feed" is the popular name for filth, smut and poisonous stuff sold cheap by the sack from the separator. My advice is, to beware of all such chicken feed. Use none but clean wheat, of the best quality, if you want healthy fowls. Corn, oats, peas, flaxseed, sunflower seed, etc., are all good feed in variety. Feed plentifully by all means if you desire plenty of eggs. Fruits, in their season, are excellent in small quantities. A limited supply of boiled potatoes is good as a constant feed. Laying hens eat fresh meat with great avidity. A little is excellent. Although we may differ in the matter of feeding, we must agree in cleanliness as to feed, water and accommodations. H.

Culture of the Poppy for Opium.

CONTINUED FROM PAGE 102.

Obtaining the Juice by Incision.

The proper time for collecting the juice is a few days after the fall of the flower leaves, when the seeds are fully formed, but before they begin to mature. In the process of slitting, the proper instrument to use is the sharp blade of a small penknife. Before commencing, take off a capsule and examine the outer walls of its cells, carefully gauging their thickness. Then wind some thread around the knife-blade so as not to leave enough of the point naked as to cut through into the cell. A little experimenting on one or two capsules will give the operator a reliable gauge. If the capsule is cut through, the juice will find its way to the inside of the cell, where it cannot be obtained, and the capsule will be so injured as to be incapable of properly maturing its seed.

Experience has shown that the best form for the incision is to make it spirally, from the point or top to the base of the capsule. One slit, passing entirely around, is said to be sufficient; or two may be made, largely overlapping each other. A single crescent, passing entirely around the capsule, about one-third up from its base, is also found to work well; but a number of parallel cuts, from top to base, give very poor results. A very slight incision is all that is needed. A little practice will enable the operator to perform the work very rapidly.

Throughout the East the slitting is done either early in the morning or late in the afternoon. In both cases the juice is allowed to exude and partially dry on the surface for several hours before removal. It is then scraped off with a small iron scraper—the blade of a dull knife would form a very good instrument. Some prefer to slit towards the close of the day, with the idea that the damp night air is more favorable for the exuding of the juice than the dry air of daytime. This method of collecting the juice of the poppy was described by a Greek writer more than 1,800 years ago.

The Germans and French generally collect the juice from the capsule before it begins to dry, and very soon after slitting—one person passing ahead to slit the capsules, while another follows soon after, wiping off the moist juice with the forefinger and scraping it off the finger by drawing the same over the edge of a dish in which it is collected. After the juice is so collected, in any convenient vessel, it soon becomes hard and tough, and of a gray-brown color.

Subsequent Treatment.

As soon as it becomes of a doughy consistency, it should be worked up into balls with a spatula; the warmth of the hand or of the sun is sometimes required to make it work properly. No more skill and but little more time is required in this process than is employed in working butter into rolls. This is all the process required in preparing the opium for sale. In fact, it may be put in the market in forty-eight hours after it is collected.

Each head yields but a few grains of dried juice, and is exhausted by one cutting; a second incision at any time afterwards, fails to yield any juice, if the work has been properly done. In India, a blade with three points is generally employed; but careful experiments in Europe seem to show that a single blade gives equally good results.

Disgusting Practices in its Preparation.

It is said that in Asia Minor they mix warm spittle with the crude opium, which they scrape from the capsule, in order to make it work easier in shaping it into balls. In scraping the opium from the capsule, special effort is made to take off with it the dust, and a portion of the beard and skin, so as to increase the weight. It is said to be often further adulterated by admixtures with small quantities of cow dung, with extracts of the plant boiled down to a gummy consistency, and with other substances. Linseed oil is always mixed with opium from Asia Minor. Remembering this, and also bearing in mind the fact that nearly all the opium of commerce found in the drug stores of this continent is obtained from that quarter of the world, we think our people will prefer to use an article of home production, which would be prepared in a more cleanly manner.

Mode of Collecting the Juice by Expression.

In collecting by expression, plants are cut from the stem and ground or mashed to a pomace, as already stated. In this operation the vat to hold the pomace should be lined with tin or brass. Before putting the pomace in the press half a pint of alcohol is added to every forty or fifty pounds of pomace, the whole well stirred together, and allowed to stand for about an hour. The mass is then ready for the press. The alcohol used unites with the juice and renders it limpid and more easy to be taken away from the pomace by the action of the press.

The liquid, as it comes from the pomace, should be received into a settler, where it should be allowed to stand about one hour, during which time the green matter, or watery juice of the plant, will settle to the bottom, so that the opium liquid may be drawn off from the surface. Faucets should be properly arranged for that purpose. This latter should be immediately placed in shallow plates of tin, so as to stand about one-half an inch deep, and these plates arranged on suitable racks in a drying room. This room should be tight, and so arranged that the heat and moisture may escape from a single opening at or near the top. The temperature should never be allowed to fall below 130° F., or to exceed 160°. If the heat gets down, the juice will become sour and spoiled; if too high, it will scald. The drying or evaporating process must be carefully watched, day and night, until completed, and it should be continued until the opium is dry enough to scrape off from the plates, care being taken not to allow it to get too dry for that operation. When taken from the plates it should be molded into balls or blocks of about one pound weight, when it is ready for market. There is no more difficulty or mystery about the business, nor as much, than in making butter. In cutting plants for this process, care should be taken that none should go to the mill until they are sufficiently ripe—fully as ripe as required for the previously described process.

Opium Culture in Europe.

The chief portion of the opium of commerce has been derived from Asia Minor, for the last 2,000 years, until its recent introduction into China, by the English, led to its increased production for that trade in British India.

Some few years ago its cultivation was started in Germany, and with such success that it has already nearly supplanted the foreign article in that country. From Germany it passed into France, where now from 60,000 to 70,000 acres of the poppy are under successful and profitable cultivation.

Opium in Vermont.

The production of opium is fast becoming an important branch of industry in Vermont. Addison county, on the southern shore of Lake Champlain, takes the lead. Two years ago Mr. Moncton, near Middlebury, raised and manufactured opium to the value of $3,000. Mr. W. O. Wilson, of Uxbridge, has been growing it for five years, with a handsome profit. There are several acres of poppies under cultivation on one farm in East Middleboro, Vt., and a large number of farmers in that section of the State are gradually entering upon its cultivation. We have no knowledge of the variety of poppy which is grown there.

Profits of the Culture.

It is difficult to arrive at any reliable data as to the yield per acre or profits derivable from the business. The statements put forth vary greatly, and many of them are highly colored. The yield per acre, according to these statements, varies all the way from 50 to 250 pounds, and the prices obtained have an almost equally wide variation. It is presumable that the yield depends very largely upon the richness of the soil and the care employed in its cultivation and the collection of the juice. Upon the latter also depends, in a great degree, the value of the product.

A careful collection of the juice, by incision, and its preparation free from any extraneous substances, will produce a drug which will command a high price; while its collection by expression, though securing a large yield, produces a low-priced article. The two are often mixed, and in proportions which give greatly varied qualities of product, valued all the way from five to twenty dollars per pound. The value of the drug depends mainly upon the percentage of morphine which it contains, which is from three or four to twelve per cent. of the mass.

The fact that the business requires very little skilled labor, that most of it can be done by children, and that the culture can be carried on to about equally as good advantage in a small way as on a large scale, would seem to point to this as a very desirable industry to be added to our farm labor. The compactness of the product takes the matter of transportation almost entirely out of view, and admits of its introduction in remote districts where land is cheap, and where the usual diversity of agricultural labor is impractical. We are not aware that any experiments in this culture have yet been made on this coast; if any have been made, we should be pleased to note the results, and we would at the same time recommend experiments in a small way, in various localities. We presume the seed can be obtained from Vermont; and, perhaps, in small quantities in this State. Probably an ounce is sufficient to plant an acre, and might cost anywhere from $5 to $10 per ounce.

What I Know of Farming—No. 5.

Buying a Farm.

No one need be told at this day that good land is cheaper than poor—that the former may be bought more cheaply than it can be made. Yet this, like most truths, may be given undue emphasis. It should be considered in the light of the less obvious truth that *every farmer may make advantageous use of* SOME *poor land*. The smallest farm should have its strip or belt of forest; the largest should have an abundance and variety of trees; and sterile, stony land grows many if not most trees thriftily.

I am not a believer that "Five Acres" or "Ten Acres" suffice for a farm. I know where money is made on even fewer than five acres; but they who do it are few, and men of exceptional capacity and diligence. Their achievements are necessarily confined to the vicinage of cities or manufacturing villages. The great majority of all who live by agriculture want room to turn upon—want to grow grass and keep stock—and, for such, no mere garden or potato-patch will answer. They want genuine farms.

And, go where you may in this country, you will hear a farmer saying of his neighbor, "He has too much land," even where the criticism might justly be reciprocated. We cannot all be mistaken on this head.

There are men who can each manage thousands of acres of tillage, just as there are those who can skillfully wield an army of a hundred thousand men. Napoleon said there were two of this class in the Europe of his day. There are others who can handle a hundred acres, so that nothing is lost through neglect or oversight. Rules must be adapted to average capacities and circumstances. He who expects to live by cattle-rearing needs many more acres than he who is intent on grain-growing; while he who contemplates vegetable, root, and fruit culture, needs fewer acres still. As to the direction of his efforts, each will be a law unto himself.

If I were asked by a young man intent on farming to indicate the proper area for him, I would say *buy just so large a farm as half your means will pay for;* in other words, "If you are worth $20,000, invest half of it in land, the residue in stock, tools, etc., and observe the same rule of proportion, whether you be worth $100,000, or only $1,000. If you are worth just nothing at all, I would invest in land the half of that, and no more. In other words, I would either wait to earn $500 or over, or push Westward till I found land that costs practically nothing.

This, then, I take to be the gist of the popular criticisms on our farmers as having unduly enlarged their borders: *They have more land then they have capital to stock and till to the best advantage.* He who has but fifty acres has too much if he lets part of his land lie idle and unproductive for lack of team or hands to till it efficiently; while he who has a thousand acres has none to much if he has the means and talents wherewith to make the best of it all. The soil of New England is as cheap, all things considered, for him who is able to buy and work it, as that of Minnesota or Arkansas. I urge migration to the West only upon those who cannot pay for farms in the old States. I doubt whether the farmers of any other section have, in the average, done better, throughout the last ten years, than the butter-makers of Vermont, or the cheese-dairymen of this State. And yet there is, in the rigid, rocky, *patchy* character of most of our Eastern farms, an insuperable barrier to the most economic, effective cultivation.

The genius of our ego points unmistakably to cultivation by steam or some other mechanical application of power; and this requires spacious fields with few or no obstacles to the equable progress of the plow. I apprehend that, for this reason, the growth of bread-corn eastward of the Hudson can never more be considerably extended, so long as the boundless, fertile prairies can so easily pour their exhaustless supplies upon us. Fruits, vegetables, roots and grass, we must continue to grow, probably in ever increasing abundance; but we of the East will buy our bread-corn largely if not mainly from the West.

He, therefore, who buys land in the Eastern States should regard primarily its capacity to produce those crops, in which the East can never be supplanted—grass, fruits, vegetables, timber. If a farm will also produce good corn or wheat, that is a recommendation; but let him place a higher value on those capacities which will be more generally required and drawn upon.

In the West, the case is different; for, though wheat-culture still recedes before the footsteps of advancing population, and Minnesota may soon cease to grow for others, as Western New York, Ohio, Indiana, and Northern Illinois, have already done, yet Indian corn being the basis of both beef and pork, will long hold its own in the valleys of the Ohio and in that of the Upper Mississippi. As it recedes slowly westward, clover and timothy, butter and cheese, will press closely on its footsteps.

Good neighbors, good roads, good schools, good mechanics at hand, and a good church within reach, will always be valued and sought; few farmers are likely to disregard them. Let whoever buys a farm whereon to live resolve to buy once for all, and let him not forget that health is not only wealth but happiness—that an eligible location and a beautiful prospect are elements of enjoyment not only for ourselves but our friends; let him not fancy that all the land will soon be gobbled up and held at exorbitant prices, but believe that money will almost always command money's worth of whatever may be needed, so that he need not embarass himself to-day through fear that he may not be able to find settlers to-morrow, and he can hardly fail to buy judiciously and thus escape that worst species of home-sickness—sickness of home.—*Horace Greeley.*

INDIGESTION IN HORSES.—A well-known horse breeder expresses the opinion that indigestion is the source of nearly all ordinary complaints in horses, and that this is brought on by irregular feeding and watering, by exposure, fatigue, by long journeys without food in a storm, and then by overfeeding and neglecting to rub them dry before leaving them for the night.—*Country Gentleman.*

Notices to Correspondents.

Camera Lucida.—The width and frequency of the waves of light, according to the undulating theory, varies from the 34,000th part of an inch for the red or least refractive ray, to the 60,000th part for the most refractive or violet ray. Their succession is, however, still more marvelous as respects numbers, being for the red light not less than 482 millions, and 707 millions per second for the violet ray.

E. L. S., Olympia, W. T.—The opinion of anyone with regard to the value of such rock from a locality with which one is unacquainted, would amount merely to a *guess*, and would be of no worth whatever. There is but one way to arrive at any satisfactory conclusion, and that is, by having an assay made.

Mechanic, First street.—The union of one pound of hydrogen and eight pounds of oxygen to form nine pounds of aqueous vapor, is accompanied by a greater amount of force than would be developed by one thousand tons falling against the earth from a height of twenty feet.

J. V. Hall, Sacramento.—The new ice-making machine imported by Tubbs & Co. will probably be put in operation next week, and until then we are unable to get any particulars.

Construction of Hollow Walls.—The *Scientific American* of Feb. 5th gives an engraving of an improved construction of hollow walls, recently patented in England. The two walls are connected by flat plates or ties of iron, zinc or slate, built into the vertical joints of the walls.

In the Scientific Press of Jan. 7th, 1865, is an illustration of almost the same construction; which was invented by Mr. Goodrich of San José, and patented in September, 1864. The difference between the two is merely in the details of construction but, as far as we can see, we should judge that Mr. Goodrich's plan, while operating just as well with regard to excluding dampness and to the non-conduction of heat, is superior in affording more stability to the building.

Notes on Colorado.—Mr. Paul, after a delay of a few weeks, caused by business, bad weather, etc., again resumes his interesting letters on the mines and mills of this Territory. His communications contain much valuable information, which will be of interest to our readers, as showing the attempts, successful and unsuccessful, made in this promising country.

Improved Chair-Spring.

The ideal American of other lands is held to believe that the article of furniture commonly known as a chair ought, under no circumstances, to rest on more than four legs, and that, when a man sits down in such chair, as he is then to be regarded as a corporate part of the article, two of its legs must be suspended from the exercise of their functions, and his two substituted in their stead.

As an aid in this operation, and as a stable article, not easily overturned, the rocking-chair has long been the only common device employed. During the last few years, however, some bright genius invented the chair-spring, as an improvement of more general application and use. To perfect this improvement, by obviating the danger of injuring the legs of the chair and by increasing the facility of applying the device, a Californian—Mr. T. C. Purington, of Lincoln, Placer county—has invented a new spring, which we illustrate. Fig. 1 shows the nut; Fig. 2, the spring, and Fig. 3, a chair with spring attached.

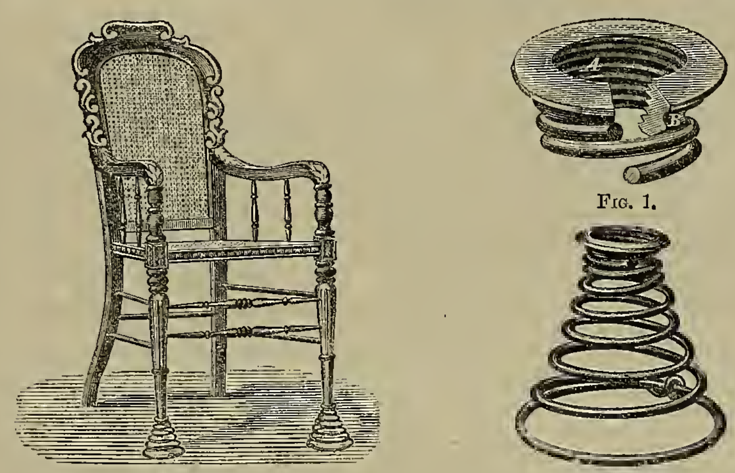

Fig. 3. Fig. 1. Fig. 2.

PURINGTON'S IMPROVED CHAIR-SPRING.

The nut is made of metal, and is provided with a screw-thread, so that it can be screwed to the leg of an ordinary chair, and instead of weakening and splitting the leg, as in the case where a hole is bored and a screw inserted to hold and attach the nut, this method strengthens it. The nut can also be very quickly and easily put on or removed.

The ease and convenience in applying the spring to the nut is readily seen. The top of the nut is provided with a collar or shoulder, and also an incline groove around the outer surface, so that the smaller end of the spring can be screwed to the nut; and its top coil being brought firmly against the shoulder, all oscillation from side to side is prevented.

To the comfort-loving American this device is indispensable. By its use the miner can add another modification to his chairs of queer construction, and the bachelor farmer can rock himself into the belief that he enjoys all the conveniences of married life. A list of other advantages too numerous to mention here may be obtained by applying to A. Mayoux, Marysville, one of the patentees, or to P. N. Roth, 809 Montgomery street, San Francisco.

◆

Large Wire Rope.—There was recently turned out from the manufactory of A. S. Hallidie & Co., a flat wire rope of extraordinary dimensions, and one which shows to what extent our mining interests are enlarging. The rope was made in one piece, 1,600 feet in length, six inches wide, one half inch thick, weighing 8,640 pounds, and intended for the Imperial Mining Company of Virginia City. There was consumed in this rope 110 *miles* of iron wire. That we have a factory capable of turning out such a rope ought to be a matter of pride to us who are so fond of our capabilities.

The Gold Fields of Victoria—No. 1

Geological Maps.

Eight years ago the colony of Victoria was agitated by questions similar to some now occupying public attention in California. The gold fields had been worked some ten years, and there were fears that these had been exhausted. To obtain definite ideas on this and other points, the proprietors of the *Argus*, the leading paper of Melbourne, sent one of their editorial staff to visit the gold regions, and his letters were afterwards published in book form. As these contain matters of much interest to those whose attention is directed towards mining, and are calculated to encourage this great interest of our State, as well as to throw light on several mooted questions of the day, we propose to make extracts from the work. It is very interesting and instructive to watch the progress of this colony, whose affairs have borne a striking similarity to ours; which, though younger than we as a gold-producing country, is yet to-day ahead of us in many respects with regard to general mining management, and where, eight years after many had supposed the auriferous deposits to be exhausted, the mines are still making large returns and paying big dividends on the capital invested in them.

One of the points which even then was acknowledged to need more attention, was a better geological survey of the country. The writer above referred to, speaks of it as a matter of reproach that no more had been done in this particular. "Even now," he says, "the prospecting miner sets out on his mission of hope, much like a seaman who goes down to the deep without chart or quadrant, without chronometer or barometer, to aid him in his navigation, and whose sole trust for the prosperous ending of his voyage is his 'sheer industry' and his fortunate stars." And yet much had already been done; much compared with what we have accomplished. The Mining Department had commenced publishing a series of charts, giving the position, extent and boundaries of the alluvial workings and of the veins in certain districts. The different deposits were denoted by different colors; numbers and figures indicated the extent of the workings, the dip of the veins, their number, position, etc., enabling the miner to form an idea of the character of the auriferous deposits and their mutual relations in the district where he was at work.

Political changes, unfortunately, put a stop to this work before it was completed. But happily its necessity had been impressed on the government, and the geological department of the public service had been kept at work, although on a limited scale. By the diligence and faithfulness of the members, much had been done nevertheless. Twenty-two maps, embracing an area of 1,188 square miles, had been published, and were for sale at a cheap rate. These maps had been prepared with the greatest care. The various rocks and soils were marked by distinct colors, the contour of the ground and the forms of the mountains and hills faithfully drawn; the depths of the rocks and of the soils recorded, wherever it was possible, and every discovery made carefully noted. "Now we are told that the clay of a deposit is adapted for brick-making; that this ironstone contains 65, that, 67 per cent. of ore; that the shales are valuable; that the ledges have produced certain yields of gold from a certain thickness of stone, and that the gold in them is associated with other minerals. * * * They tell the miner where he can sink with a fair prospect of success, and they mark out other localities where his pains would be wasted. By their help he can discover the sources of leads, and they assist him in his speculations as to where those leads go and where they should be sought for. To the agricultural settler, the vine-grower, and others whose industries are affected by the peculiarities of the soil and its aspect, they are also important, supplying information which could only be obtained by expensive journeys and local inquiries."

Want of space prevents our speaking more fully on this important subject, and we can only touch on some of those measures to which the present prosperity of the colony is due. But we cannot close without calling attention to the amount of self-abnegation and devotion to science involved in such work, of which the public are but little aware. "They spend their days in the woods or rambling over barren hills and deserted valleys, doing nothing but chipping off bits of rocks, measuring the depths of soils and making hieroglyphics in note-books about things which nobody will buy. They are on gold fields, but they do not dig. They descend shafts, and they look at the wash-dirt, but they search curiously for little odd bits of stone and clay, and are strangely indifferent to the gold the dirt contains. They 'fossick' about old workings, but they look for fragments of rock and pebbles or bits of rough cement, of no value to any one, and go home contentedly with wallets full of trash as valueless as fairy gold. They spend their evenings, marking out the results of their works for the benefit of others whom they may never see and who may never hear of them. * * * These apparently misanthropic beings are the surveyors, and from their single-hearted devotion to science we have gained almost all the knowledge we possess of the formation of the land we live in. It is to be hoped, for many reasons, that greater liberality on the part of Parliament (State Legislature) and, perhaps, an improvement of the arrangements of the Survey Department, will enable geologists to expedite their labors and place the public as early as possible in possession of a completed geological map of the country," which remarks we apply to the present times, in our own State, and with a hearty amen.

◆

Encouragement to Domestic Productions.—In the State Assembly, Mr. Waldon has introduced a bill to encourage iron manufacture, by providing for a premium of $12 per ton for every ton manufactured in this State up to 5,000 tons, and by exempting from taxation all iron furnaces for 12 years. Mr. Newell introduced a bill to encourage the raising of Angora and Cashmere goats, and the manufacture of fabrics from their fleece. Premiums varying from $500 to $2,000 to be given to persons who shall exhibit at the State Agricultural Fair in 1874 amounts of from 500 to 7,000 pounds of wool, the production of one year's clipping, from Angora or Cashmere goats of seven-eighths, fifteen-sixteenths or pure blood. The premiums for fabrics manufactured from their fleece vary from $3,000 to $10,000.

◆

Redeeming the Colorado Desert.—Some time ago Dr. Wozencraft brought up a proposition for redeeming a part of this desert by leading in water from the Colorado river. This scheme has again been revived, and brought before the State Legislature by a bill introduced by Mr. Rockwell, which provides for the cession of land to the doctor on condition of his introducing and furnishing a permanent supply of fresh water along the line of travel between Fort Yuma and the San Gorgona Pass, and Fort Yuma and Cerico creek.

Our Home Industries.

Sale of Crushed and Sampled Ores at San Francisco.

Many miners who possess good lodes have not the capital or means necessary to work their ores. Hence, heretofore, in many instances, they have been obliged to dispose of their claims either wholly or in part, or else let them lie idle. In either case there were many disadvantages. Many valuable claims have been sacrificed for a trifle, and many others have been sold for a high price which have proved worthless, and the business has been too speculative. The assays made have too often afforded—from the hap-hazard system followed—incorrect results, being too frequently merely of picked samples and affording no criterion of the richness of a ledge.

The Completion of Railroads

Through mining districts has worked a considerable change, enabling the miner to send amounts, varying from a ton upwards, to this city, at a moderately small expense (for instance, the freight from Elko is at present $14 per ton), and here have the ore tested in such quantities as to give a fair indication of the value of the deposits. Those without the means of working their ores can, moreover, send them hither and have them properly assayed, and sold on these assays to the highest bidder. There have for some time past existed works in this city for sampling and testing ores; but the business seems to be extending now, and daily the advantages to both seller and purchaser are increasing.

How this is Effected.

The ore can be sent to some responsible agent, who takes it to the crushing and sampling works and has the whole amount crushed and carefully sampled, and the samples then assayed with fair results. On the result of the assay being made known, the ore can be sold; and there is no reason, in this case, for charging unfairness on the seller, as the buyer can see the ore and know just what it contains. Moreover, there are several houses here which are ready to make advances on the ore as soon as the value of the assay is given; and thus the miner realizes immediately a part of the value of his ore, and the rest as soon as it is sold.

Prices Paid for Ores.

The prices paid for ore here varies somewhat at different times and according to the nature of the gangue. This is especially the case with silver ores. A ton of this weighs 2,000 pounds avoirdupois. Mr. Atwood tells us he hopes to make some arrangements soon which will regulate this better. A ton of copper ore weighs 2,352 pounds. The copper is paid for by the unit. We publish weekly the approximate prices which can be realized. This class of ore is assayed by the humid process, and 1 3-10 per cent. deducted to equal the fire assay. Silver in copper ore is paid for by some parties when assaying $50 per ton, by others, when assaying $30; but this varies at different times.

Shipping Ores to England.

Messrs. Rodgers, Meyer & Co. make an advance to the miner of 50 per cent. of the value of the ore as determined by assay here. Advances are made on copper ores assaying 15 per cent. and over, and on silver ores assaying $100 or more. The ores are sent to Liverpool, and there sold to the highest bidder; and as bids are made by smelting works, chemical factories, etc., several ingredients—as, for instance, the sulphur—which are generally valueless here, are paid for. The bids are per ton of 2,352 pounds, the amount of moisture, as determined by assay, and a draftage of 24½ pounds to the ton being deducted. The sacks are also sold if of any value. After the sale, the money is paid to the miner, less the actual expenses and a commission of five per cent. The advantages of sending to England are, the higher price obtained by having the sale open to the public competition of so many parties, and by selling the various substances which cannot be sold here. The chief disadvantage is the time required for making the final returns. The latest Liverpool quotations were $3¼ per unit for copper ore and $332¼ for bars. Bar silver was quoted at $1.25 per ounce standard.

Crushing and Sampling Works.

There are several of these in the city. The general charge is $10 per ton for small lots, but for large amounts considerable reduction is made. Messrs. H. W. Gray & Co., of the Yolo mills, corner of Market and Beale streets, have done this work for some time. Messrs. S. W. Howland & Co., 413 Mission street, pay particular attention to this department. We visited their works last week and witnessed their method of operating.

The ore is first crushed into small pieces by being passed through a Wilson crusher. It then goes to a large apparatus, resembling a coffee mill, where it is reduced to the size of fine gravel. It is then mixed in the most thorough manner by being spread out on the floor and repeatedly turned over and over. A tenth part is now passed through a mill of Mr. Howland's own design, where it is reduced to fine powder. This is again mixed thoroughly, about 50 pounds taken and treated in a similar manner. Finally, from different parts of the last pile made, about five or six pounds are taken, and put into four bottles, which are sealed up, labeled and sent to the assayers. By these means as fair samples are made as are well possible. Each apparatus is carefully cleaned after being used and the floors swept. On ascertaining the assay values, the ores can be sold to the best advantage.

Buying for American Works.

Mr. W. T. Atwood, 507 Montgomery street, is probably the largest purchaser of ore for the Eastern markets. He gives us weekly the copper market returns. We have obtained from him, also, the rules for purchasing copper ore adopted by all the American works. According to these, the weight of a ton is computed at 2,352 pounds. Moisture assay is taken and deducted by weight. Assay to be made by humid process, and 1 3-10 per cent. deducted to equal fire-assay. Any return made in assay beyond tenths not to be computed.

Many miners do not understand why they do not receive as much as they think they ought. We give these particulars merely to show how the buyers here are obliged to make computations to cover the deductions made where they in turn become the sellers.

Testing Ores, Etc.

There are, moreover, various establishments for testing ores by practically working them on a small scale. This is done at the several foundries. G. W. Strong, of No. 10 Stevenson street, is well known in the business, and also as an assayer. Chas. Pletz & Co., 36 Fremont street, are likewise engaged in this work. At 220 Fremont street, the well known Varney pans are at work. The parties all make assays as well, as do also Messrs. Falkenau & Hanks (State Assayers), at the Pacific Chemical Works, and J. S. Phillips, 423 Washington street. There are also other parties too numerous to mention.

The prices of assays vary somewhat. For gold or silver, or both, from $2½ to $5; for copper, it is $5; for all three, $10. The prices for working the silver or gold ores, to find out the best method, etc., cannot be given with any degree of exactness until the ore is seen, as the different qualities vary so much in case of working. The very lowest-priced given is at the rate of $40 per ton for the simplest silver ore.

There is a very large amount of work done in this line at San Francisco during the brisk business times. Everything is at present dull, and the influence is felt especially in mining; yet large amounts have still been treated here in the last few days, and the value of having these crushing and testing works in the city is becoming better understood every day.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending February 8th.

Gang-Plow.—John Cox and Solomon Cox, Eugene City, Oregon.

Claim 1.—The bars *f g h*, when combined with the upright bar E and plow-beams D D, substantially in the manner and for the purpose herein shown and described.

2.—The ratchet-wheel *l* and loose lever H, when used in combination with the pawl *n*, and with the ropes or chains *m*, substantially as herein shown and described.

Vehicle Spring.—John Goller, Los Angeles, Cal.

Claim 1.—A wooden spring, K, slotted from the initial point of the bend out to the end thereof, and strengthened throughout the curve by a steel-spring plate, I, in the center, and a circumjacent steel-spring plate, A, all as shown and described.

2.—A spring, whose end works easily against some elastic material in the socket of a circumjacent steel band, A, and is thereby allowed to readily contract and expand longitudinally, in the manner set forth.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Improved Paddle Wheel.—Adam Wingard, S. F.—The object of this invention is to so construct the buckets or floats of a paddle wheel, that there will be but little power lost or expended, either by pounding on the water as they enter, or by lifting up the water as they emerge. To effect this, the wheel is constructed of one or more separate wheels, each one of which consists of arms or spokes radiating from the hub and connected at their extreme ends by a rim or metal band, which serves to strengthen and keep them in their proper position. Other bands may be employed at suitable distances, if necessary, to give greater strength to the wheels. On these arms are placed the floats or buckets, which consist of three wings, at angles of 120 degrees with one another, which revolve on the arms as axles. When more than one wheel is used, the buckets are arranged so as to alternate in position with those of the next wheel. It is claimed that when the wheel revolves, the buckets turn as the motion of the wheel induces them, but when they strike the water, one of them, acting as a rudder, causes the other two to stand so as to present a V-shaped opening or trough to engage the water, while on emerging they will again revolve so as to discharge the water. As the wings taper toward their outer end, they enter the water more easily than if they were of equal width their entire length, while after being submerged, the greater width of the upper end causes them to exert more driving power. In reversing the wheel, the wings reverse themselves, thereby relieving the engine, and allowing the operation to be effected immediately. There are various other points claimed, which are important. In the case of heavy seas striking the wheel above the surface of the water, the buckets revolve and yield to the force of the blow, thus avoiding the stiff resistance of the ordinary fixed floats. The shape of the paddle, moreover, tends to concentrate the water on the face of the bucket instead of depressing it. Experiments made, show a decided gain, it is said, over the ordinary constructions, and arrangements have been made to repeat these experiments on such a scale as to satisfy everyone.

Improved Pruning Knife.—H. Alter, Lakeport, Lake Co., Cal.—This instrument can be used not only for cutting off the smaller branches of trees, but likewise for sawing off the larger limbs. The knife moves in a slot at the back of a bar. A suitable spring serves to throw the knife upward, after use, while by means of a level, the blade is brought down when it is required to cut any branch. At the end of the lever is a saw, for use on the large limbs, so attached as to be opened or shut similarly to the blade of a knife. The lower end of the bar is provided with a suitable hole, into which a stick or rod may be inserted for the purpose of raising the instrument, when it is desired to prune the tops of the trees, in which case a string or cord is attached to the end of the lever, so as to draw it down and thus operate the knife. By this combination a suitable implement is provided for performing all the operations necessary in pruning trees, and one which can be easily handled and operated even amongst the topmost branches.

Swivel Shackle.—W. Williams, Vallejo, Cal.—This device is an improved swivel shackle or coupling, which may be used for connecting the chains or cables of anchors, or for other purposes, when it sometimes becomes necessary to effect a rapid separation. It consists of two links of a shackle, connected together by a bolt, one end of which is permanently connected with one link, while the other is made in the form of a cross or star, which is introduced into the other link through a similarly formed slot, after which it is turned and secured by means of a key. This coupling is especially valuable for use on ships' cables, where it may be necessary to slip the cables and to move the vessel instantly, as the only operation necessary to accomplish the first object is to remove the key and turn the cross-shaped link until the lugs pass through the slots in the other link, when the two parts are freed.

Lectures to Mechanics.

We have received a programme of the fifth course of "Lectures to Mechanics," to be delivered this year at the Sheffield Scientific School, and with the programme came a complimentary ticket, which we wish we could use. The course comprises fourteen lectures on different subjects, embracing quite a large range of topics, and the price of tickets for the course is placed at the merely nominal sum of *one dollar*.

The liberal educational spirit evinced by the managers of the Sheffield Scientific, in thus giving instruction to the public, is deserving of the highest commendation, and ought to be imitated on our coast. We are rather behind the times in this respect. At the East, especially in Boston, manifold advantages for obtaining instruction are offered to the poor man as well as to the rich. Education is the main-spring of all improvement, and that country which gives the best education to its inhabitants may well lay claim to being the "finest country in the world."

John Lowell has rendered himself deservedly famous by providing the Lowell Institute lectures at Boston, Peter Cooper, by the same act in New York, and others in various parts of the country. The man is yet to be found who is ready to render a public benefaction by a similar proceeding in this city. May that man soon appear.

◆

Local Aid to Railroads.—J. Ross Browne has published a carefully prepared pamphlet of forty-eight pages on "The policy of extending local aid to railroads, with special reference to the proposed line through the San Joaquin Valley to the Colorado." This pamphlet contains an interesting statement of the arguments in favor of such an enterprise, showing the advantages which would accrue therefrom to the counties interested, and advocating the policy of local aid from such counties as a means of securing its early completion. The arguments adduced are logical and exhaustive, and will be read with much interest by all who feel an interest in the material development of the State. The pamphlet was placed in our hands too late for any extended notice this week. We shall endeavor to refer to it again more at length.

◆

Earthen and Stoneware.—Daniel Brannan, the enterprising manufacturer of all sorts of useful and ornamental stone and earthenware, fire bricks, etc., at San Antonio, has favored us with a call, and left his card, which will be found in our advertising columns, and to which we refer our readers for further information.

◆

Dairy Business.—Experience is fast proving the fact that the dairy business is one of the most reliable and profitable in this State.

Our Agents.

OUR FRIENDS can do mnch in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none bnt worthy men.

Traveling Agents.

LONDON—George Street, 30 Cornhill, E. C.
HEDGON & MENET, 41 Park Row, New York.
A. C. KNOX, City Soliciting and Collecting Agent.

THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

I. O. O. F.

THE NEW AGE,

A WEEKLY JOURNAL OF SIXTEEN PAGES.

The "Official Organ" of the I. O. O. F. on the Pacific Coast.

Is devoted to Odd Fellowship, the ARTS AND SCIENCES and GENERAL LITERATURE; and as a family paper is not surpassed by any journal in the United States. Subscription price per year by mail, $5. Delivered in the city, per month, 50 cents. Office, Odd Fellows' Hall, 327 Montgomery street, San Francisco. 19v19

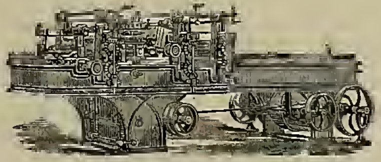
WOODWORTH PLANERS.



PLANERS AND MATCHERS,

With patent expansion feed gears and other improvements, made in the most finished and substantial manner; also every description of Richardson, Meriam & Co's, Smiths and

J. A. FAY & CO'S IMPROVED

Wood Working Machinery.

Embracing various styles and sizes of the following Labor-saving Machines:

Morticing (Sash and Door),
Sash and Moulding,
Blind Slat Tenoning,
Boring (Horizontal and Upright),
Shaping,
Re-sawing,
Planing and Matching,
Blind Stile Boring,
Blind Wiring,
Blind Slat Planing,
Rod and Dowell,
Hand and Foot Mitering,
Railway Sawing,
Improved Tenoning,
Variety Moulding (Gear's Patent), } Machines.

An assortment of the best always on hand.

SCROLL SAWS, DIMENSION PLANERS, GROOVER SAWS, FAY'S PATENT BAND SAWS, WOOD TURNING LATHES OF ALL KINDS.

ENGINE LATHES and Machinists' Tools generally, with also a large assortment of small machines used in Planing Mills, Machine Shops, etc. Also, Planer Knives, Saw Gauges, Matcher Sets, Sash and Matcher Heads, Saw Tables and Arbors, etc. Being the selling agents for most first-class Eastern Machinery Builders, we sell THE BEST, and at manufacturers' prices. Invoices of the above Machinery are now being received by every vessel. ☞ Send for Illustrated Catalogue.

BERRY & PLACE,

112 and 114 California Street, San Francisco.

☞ Agents for Blake's Patent Steam Pump, Davis & Furber's Woolen Machinery, Gear's Upright Shapers, Fay's Band Saws, Washington Iron Works Portable Engines, Saw Mills, etc., etc. c7v20

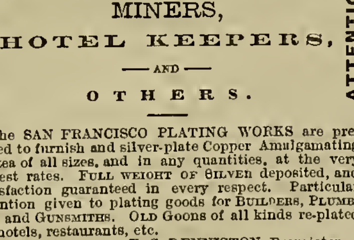
To Carpenters and Stair Builders.



Drew's Patent Extension Pitch-Board

Saves TIME, LABOR, and LUMBER, and secures exactness and perfect work. This is a very simple instrument, which is quickly and easily adjusted (as may be seen by the engraving), so as to give any desired pitch and tread for stair building. It is adjusted by a system of slides and screws. Full information may be obtained of the inventor, JOHN R. DREW,
5y20 Cor. Natoma and Fifth streets, S, F

Metallurgy.

Metallurgical.

The undersigned respectfully announce to the public (especially to parties interested in mining) that they have opened an office at

No. 86 FREMONT STREET,

And WORKS at H. J BOOTH & CO'S FOUNDRY, northeast corner First and Mission streets, San Francisco, where Ores in small or large quantities of all kinds can be worked by Pan Amalgamation, Chlorination or Smelting, and all kinds of Assays and Analyses made. We will also sample any Ores entrusted to our care; and in all cases returns made in the shortest time possible. We will give consultations on the best methods of successfully working Sulphurets or Refractory Ore.

Drawings Furnished for Quartz Mills, Smelting and Chlorination Furnaces.

By having had long practical experience in working Gold, Silver, Copper and Lead Ores, we hope thereby to get a share of the patronage of the mining public. Mines Examined and Reports made.

Prices varying from $1 50 to $2 per day for Board and Room.

FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.

Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for 50 cents
F. E. WEYOANT, Proprietor.

DR. ABORN,

Oculist, Aurist,
AND
CATARRH, THROAT
AND
Lung Physician.

No. 22 KEARNY STREET,
SAN FRANCISCO, CAL.

Testimonials from Well-known Citizens of California as evidence of his success.

Card from Charles N. Fox Esq., of the firm of Campbell, Fox & Campbell, Attorneys, 528 California Street.

I have for many months suffered from Catarrh, accompanied with unpleasant sensations and sounds in the ears. Recently I found my hearing impaired, and at once applied to Dr. Aborn, No. 22 Kearny street, San Francisco. He improved my hearing almost instantaneously, and now, after being under his care six days only, I feel as if entirely cured, and my hearing is restored. CHARLES N. FOX.
San Francisco (Cal.), Jan, 10, 1870.

Card from S. O. Houghton, Esq., Attorney at Law.

I have been afflicted with severe nasal Catarrh for two years, which a few months since extended to my throat, producing a distressing cough, and seriously impairing my health generally. I have been under treatment by Dr. Aborn, at 22 Kearny street, San Francisco, for about three weeks, and have been already greatly relieved—my cough has almost disappeared and my health greatly improved. By one application, Dr. Aborn relieved me of a very severe neuralgic pain, and with four applications it was entirely cured. S. O. HOUGHTON.
San Jose (Cal,), Nov. 22, 1869.

From Hon. Jas. A. Johnson, M. C., California.

TO WHOM IT MAY CONCERN.—Having been a sufferer with Catarrh and a severe bronchial affection for more than seven years, and having found great relief by submitting myself to Dr. Aborn's treatment for a few days only, I take pleasure in saying Dr. Aborn, with his new and improved instruments for local applications to the lungs, air passages, eyes and ears, should encourage all who are affected in those parts to cherish a lively hope that they may find quick and permanent relief. Very truly, JAMES A. JOHNSON, M. C., California.

A Wonderful Cure.

Having been afflicted for over twenty years with a disease in the left nostril, which has been called by different names—cancer, scrofula and ozena—different physicians have tried their skill in attempting its cure, but without success. It has rendered me incapable of labor for the last two years. Since the beginning of June last I have been in the Sacramento hospital reduced to a mere skeleton. On the 23d of November I left the hospital, and since the 26th have been under the treatment of Dr. Aborn in this city, and the disease is already nearly cured, and my strength and general health very much improved, and I have full confidence of a perfect cure. Already I have gained many pounds in weight, and look and feel like another person. The success of Dr. Aborn's treatment in my case should be sufficient to encourage all who have chronic diseases to make another trial for that good prize—health.
WILLIAM BEARDSLEE.
Pacific House, San Francisco, Dec. 13, 1869.

Another Remarkable Cure.

For the benefit of the afflicted and as an act of justice to the skill of Dr. Aborn, I make the following statement: For about two years I was seriously afflicted with a bronchial affection. I had a distressing cough, difficulty of breathing, expectoration, night sweats, and was losing flesh very rapidly. I was treated by five physicians without any benefit, but continued to grow worse, and was finally advised by them to leave the city, as in their opinions I could not be cured in this climate; but my business relations were such as to preclude a change of climate, although my health was declining so fast that I could not have lived long without relief. Two months ago, when Dr. Aborn arrived, I read his publications and the testimonials of his remarkable cures, which led me to believe that there must be merit in his treatment. So I placed myself under his care, and it is with great pleasure that I am able to say that he has cured me of those distressing and dangerous bronchial affections; also, the night sweats, cough, etc. I was unable to attend to business since April last, until after being under Dr. Aborn's treatment for one week. My improvement was so rapid that in one week's time I was able to resume my business, and I have continued to gain ever since so rapidly that even my friends are surprised at the remarkable results of his treatment.
VINCENT MONATTI,
Corner of Dupont and Green streets.
San Francisco, Dec. 25, 1869. 7v20-3m

HIBBERD, SANBORN & CO.,

STAIR

BUILDERS.

South Point Mills, Berry Street,
Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins. Fancy Newels and Balusters.

MARAVILLA COCOA.—*For Breakfast.*—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœpaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

Reading for the Hour.

BETTER NOT TO SPIT.—If a man will chew tobacco, he ought, at least for the sake of common decency, to be careful as to where he deposits his saliva. From absence of the possession of this decency, a carpenter at Sacramento, according to the *Record*, has been obliged to pay a heavy price for one spit. Ejecting his saliva, without any care as to where it went, it alighted on the fine velvet cloak of a lady who was passing. She was exceedingly wroth, and went after the cause of the dirty accident. He tried to excuse himself; but it was no use. The lady demanded $15 for the damage, which was paid. He may consider himself lucky at getting off so cheaply.

A BRILLIANT genius of Pottsville (Pa.) is on the point of annihilating distance by running cars 17 feet wide at the rate of 60 miles an hour. A single track will have four rails instead of two. The distance between San Francisco and New York will be traversed in 60 hours, including stoppages. The *Miners' Journal*, at the close of an article on the invention, inquires, "Is not this a wonderful age?" We reply that it is.

LADY BROKERS.—A couple of adventurous ladies have started a broker's office on Wall street, New York. They are said to be quite pretty, and are having a large share of curiosity, if not business. All kinds of rumors are circulated with regard to their credit. One report says they are backed by the gallant Commodore Vanderbilt.

CURATIVE VIRTUES OF LIVE OAK.—The White Pine *News* says that a doctor at Hamilton has discovered that the California live oak contains an oil equal, if not superior, to any medicine now advertised. The list of diseases cured equals that of the King of Pain, and closes with the customary troubles of such lists—sore throat and piles.

THE OCCIDENTAL HOTEL is to have a new elevator for the accommodation of its guests. A member of a New York firm has arrived to make all necessary arrangements for putting up a most sumptuous machine, which will probably be stationed in the front hall. [The old elevators at the bar have proved complete successes, judging from the patronage.]

GOLD EXCITEMENT IN INDIANA.—A miner has been prospecting in Clarke county and has found gold, according to the reports, in paying quantities, in every handful of earth. The people in that section are wild with the mania, and are leaving other business to search for the precious metal. We heard of such cases before.

A WARNING TO LEGISLATORS.—The members of the Louisiana Legislature have received notifications from the "Knights of L." (whatever that may be), that if they pass any unrighteous bills they will receive condign punishment. If the valiant knights fulfill their threats, Louisiana may soon be deprived of its legislative bodies.

NOBLE SPIRITS.—A number of members of the Mercantile Library, who have been fined, according to rule, for keeping out books over the time allowed, have withdrawn in anger from the institution. The Library Association has been improved by the withdrawal of such spirits, whose room is much better than their company.

CHINESE FARMING IN CALIFORNIA.—A San Joaquin paper says that the Chinese are giving their attention to farming in that county; and that they fasten their plows to the horse's tail.

"COLD SLAW" is a corruption of "*kohl salat*," which is Dutch for cabbage salad.

Specimen from the Antique.

The accompanying illustration has been given us with the remark that it contains a moral. This being the case, we have consented to allow it a space in our columns. Morals are none too frequent on this coast.

The artist whose fertile brain produced this elegant picture, must have flourished apparently in the early times, for antiquity is impressed in every line. We have no hesitation in dating the work at some year after the discovery of America. Three things are evident: that it was executed after the invention of lawyers, after the invention of printing, and after the invention of milking. This would denote a very early date.

The moral alluded to is evident. Two parties are expending their time and exertion in endeavoring to dispossess one another of a cow, without other result than the benefit of a third party, whose occupation and character are plainly denoted by the wig, the well-filled bag (projecting from the pocket), the sharp lines of the nose, the shrewd twinkle of the eye, and the firm grasp of the hand. We haven't the slightest doubt that there is a fourth party, engaged in a similar way, on the other side of the animal, omitted, perhaps, because the author felt himself unable to do complete justice to the subject.

We have the greatest respect for all lawyers; and our remarks just above apply only to the gentlemen who existed at the time of the original publication of the picture, since which time great improvements have been made by these limbs of the law. But, unfortunately, the spirit evinced by the other figures is as rife now as in the olden times. Men now-a-days are as ready as ever to quarrel with one another until the costs have completely swallowed up the value of the contested article. As long as there is any milk to be extracted for the lawyer, the contest will be prolonged to the detriment of the poor animal, who is meanwhile worried, harassed, deprived of sustinence, and rendered worthless to the party which may finally obtain a useless carcass.

Man is a queer animal. The slightest difference about no matter how worthless a thing is sufficient to make a couple go to law and fight with tooth and nail until completely exhausted. A gentleman remarked to us, a few days ago, that he would rather pay five hundred dollars to a lawyer than twenty to a man who had made a claim which he considered as infringing on his rights. This is, apparently, according to nature. At least it is the impulse in ninety-nine cases out of a hundred. How few men there are who have never had a lawsuit! And how few lawsuits there are where the victorious party has made any real gain, especially when we take into consideration the loss of time and of mental quiet!

We dedicate the picture to our readers. If any one of them is disposed to "take the law" on another, we advise him to go home, indulge in a cup of cold water, and gaze intently at the illustration for a quarter of an hour before taking any decided steps.

A Beer House in Africa.

Paul du Chaillu, if he does sometimes tell rather tall stories about his travels, knows how to tell them well. He gives the following description of a beer house in Africa: It was a large building, under a single roof, supported by numerous wooden pillars, and on these hung a great many bunches of plantain. In the middle of the building there were scores of large jars, manufactured in the country, some of which would hold ten or fifteen gallons. From the neck of some of them a quantity of rich white froth was running out. The beer in others was just ripe, and ready for drinking. There were also many large mugs, looking more like dishes, however, for the plantain juice to be poured into.

Very soon the men seated themselves, either on the stools that belong to them or on mats, and the drinking began. Mug after mug was swallowed by each man. I think no German would drink the same amount of liquid. They became, after a while, jolly and boisterous; they began, in fact, to get tipsy.

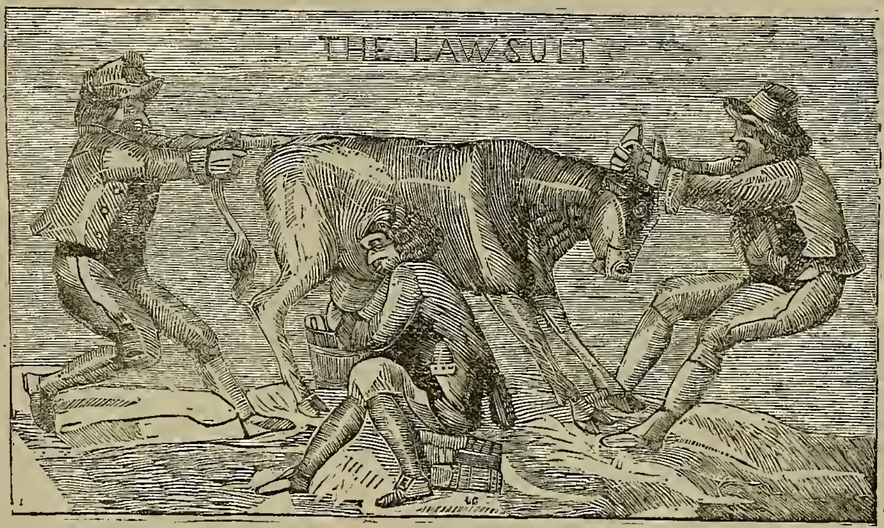
Do not believe they were drinking at random. Each jug of wine belonged to several men, who had clubbed together; that is to say, each had given a certain amount of plantain to make the beer, which the vessel contained.

The bunches of plantain, which were hanging by hundreds, had their owners, and had been brought from the plantation by their wives, and were ripening in the shade. As the plantations yield fruit all the year round, the beer is never lacking among the Ashiras.

After they were sufficiently excited, they began to talk of their wonderful warlike exploits, and I do believe it was who should lie the most. The greater the lie, the louder the applause.

I tasted the plantain beer, and found it somewhat sour; I did not like it at all.

I spent the day in the beer-house, and, when we returned to the village, the men insisted on having another dance, and they kept hard at work at it all night, and all went to sleep the next morning. I was glad when everything was over, for my head began to ache.



[By one of the "Old Masters."]

DON'T BOX A CHILD'S EARS.—It is a barbarous practice, and dangerous. The passage of the ear is closed by a thin membrane, especially adapted to be influenced by every impulse of the air, and with nothing but the air to support it internally. If any one designed to break or overstretch the membrane, he could scarcely devise a more effective means than to bring the hand suddenly and forcibly down upon the passage of the ear, thus driving air violently before it, with no possibility of its escape but by the membrane giving way. Children are sometimes made deaf in this way.

A GOOD USE FOR SOAP-GREASE.—"Any soap-grease to-day ma'am?" "No, sir; I use my own soap-grease." "Make your own soap?" "No, sir." "How do you use your own soap-grease, then?" "I make it into eggs," I said, smiling. The man looked so astonished and half frightened that I thought it time to explain. "I feed the grease and fat which is unfit for cooking to the chickens."

A NEW RELIGIOUS SECT.—Of making books, says the Preacher, there is no end. The same person might have made a similer remark about religious sects, had he lived in these days. The Albany *Knickerbocker* gives an account of a new religious sect which has just been organized near that city. This party is composed of men and women; but instead of there being a dividing line, they mingle together in a love-feast sort of style. Music is their hobby, and through its influence they all expect to be saved. The members are principally musicians of some sort, and those who are not blow upon horns, sing to the full extent and powers of their lungs, in the hopes that the noise, if not the sweetness of their notes, will secure their salvation. The members of the new society are now engaged in practice for the summer of 1870. A friend of ours who was present at a late rehearsal, says it was terrible; the beating of bass drums, blowing of horns, trombones, flutes, pipes, etc., knocking the great Peace Jubilee into a cocked-hat. It was fearful. There was no harmony or order, but all banged and blowed away on their own hook. One person is selected as chief. He is the favored one of the order, dressed like the apostles of old, who is elevated upon a platform, and instead of using a wand as leaders of orchestrae usually do, he swung a huge mallet, which came down with great force upon some arrangement which vibrated far and near, like the echo of a huge bell or heavy piece of ordnance. The whole arrangement resembles a great burlesque, but the *Knickerbocker's* informant says he never saw a more earnest collection of devotees, or met with a more friendly set of people.

MANAGEMENT OF BROOMS. If a broom is occasionally dipped into boiling suds, the straws will in a measure lose their brittleness and become *tough*, and do less injury to a carpet. It will also last much longer. Brooms wear out carpets full as much as the usual tramping over them. Before commencing to sweep a carpet, dip the broom into a pail of cold water and strike it against some object, to knock off the drops. drops. Repeat this frequently while sweeping, and you will raise little dust, and be surprised at the quantity of dirt which will settle in the bottom of the pail. It is well to strew moistened sawdust, Indian meal or tea leaves on a carpet before sweeping. Fine, moist salt is equally as good or better, and gives the carpet a nice clean look.

HOW TO DRINK ICE WATER.—Ice water may be drank so as to be very injurious to health, and even dangerous to life; or it may be drank in a manner to be a healthful and refreshing beverage. Ice water should *always be drank slowly*. The warmer and more thirsty the drinker, the *slower* he should drink. The swallows should be taken at sufficient intervals to allow the stomach to gradually accommodate itself to the great change of temperature.

STARTLING JUDICIAL DECISION.—There is a report that in one of the courts of this city a decision has been rendered to the effect that taking any umbrella which may be lying around loose, is stealing, and, as such, is punishable by law. Is'nt this infringing on the rights of public property?

TO AVOID TROUBLE FROM DREAMS.—Dreams are usually the result of a disordered physical or mental condition. Persons in perfect physical and mental health rarely dream. The preventive, therefore, lies in recovering the health. Temperance in eating and drinking is the best way to prevent dreams.

THE following advertisement lately appeared in a London paper: "Wanted, by a father, a school, where his son may receive an education to fit him for a manly and useful life, without any humbug as to nations dead and buried thousands of years ago."

PRACTICAL printers propose to start a small daily paper in Napa, March 1st. They had better defer it just one month.—*Oakland News.*

Scientific Press.—After January 1, 1870, the Mining and Scientific Press will resume its original title of Scientific Press, under which it was established in 1860, and will continue to be devoted to the improvement of the three great branches of industry—Mining, Farming, and Mechanic Arts—whose interests are intimately associated on this coast and are popularly and reliably represented by the Press. The subscription price is reduced to $4 per annum. Other charges will be at the lowest rates. This paper has been enlarged and improved in every department, and is now one of the best on this coast. Published by Dewey & Co., U. S. and Foreign Patent Agents, 414 Clay street, San Francisco.—*Tulare Times.*

A Valuable Book for Inventors and Artisans.—Dewey & Co., publishers of the Scientific Press and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the Scientific Press office, postpaid, for $1.—*New Age.*

Treatment of Rebellious Silver Ores, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 26 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

Block Tin and Solder Wire, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 24v19-3m
